SUBSCRIPTION.

POST FREE TO ANY PART OF THE UNITED KINGDOM.

One Year ..... £1 12 6 Six Months ..... £0 18 3

TO THE CONTINENT, COLONIES, UNITED STATES, INDIA, CHINA, AND ALL PLACES

ABROAD ..... One Year 1 14 8

\*\* In consequence of the new postal arrangements, the Annual Subscription for India, China, and all foreign countries will now be reduced to £1 14s. 8d., instead of £1 10s. 10d. as formerly.

Post Office Orders and Cheques should be addressed to The Publisher, THE LANCET Office, 423, Strand, London, and crossed "London and Westminster Bank, St. James's-square."

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an additional advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance. Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertising Department in France—J. ASTIER, 66, Rue Caumartin, Paris.

NOTICE.—Advertisers are requested to observe that it is contrary to the Postal Regulations to receive at Post Offices letters addressed to initials only.

# THE KEPLER MALT EXTRACT.

Why it is so popular with the Medical Profession.

## ITS VALUE.

WHEN we realise that the truth of the medical axiom, that any serious derangement of the digestive process may give rise to grave functional and organic disease, is now admitted universally, we can understand at once the extraordinary popularity of the Kepler Malt Extract and the Kepler Malt Extract combinations (as auxiliaries in inefficient digestion, and as correctors in malnutrition) in so many varying cases, and under such widely differing circumstances. Its value once admitted, it becomes really important to know the main characteristics of an ideal Malt Extract such as the Kepler.

## THE CHIEF POINTS OF IDEAL EXTRACTS.

## OTHER DESIDERATA.

## THE COMPARATIVE VALUE OF MALT EXTRACTS.

What is it that constitutes an extract of malt which is scientifically perfect in every respect?

1. It should be prepared from the very best winter barley, and no other cereal but barley, and contain all the nutritive principles of the grain. This is imperative.
2. It should be evaporated *in vacuo*, and not in an open pan. This is indispensable—or, instead of being pleasant, the malt will possess a burnt or tarry taste and smell.
3. No substitution should be allowed—as of other cereals—for a part of the barley, or glucose for a part of the maltose.
4. There must be absolute purity and an absence of all adulterants.
5. It should be rich in diastase—the digestive ferment which converts starch into sugar.
6. It should be of substantial consistence, or it will be liable to turn sour.
7. If the heat in the process of manufacturing be raised too high, the diastase will be destroyed.
8. No fermentation whatever should be permitted to take place, or the maltose will be partially converted into alcohol and carbonic acid, and a kind of beer will result. It will thus be made clear that the therapeutic value of a malt extract will depend not only upon the presence of important food elements—such as dextrin, maltose, and alkaline phosphates—but on the fullest percentage of the peculiarly active substance, diastase, which is mainly concerned in the conversion of the starch of farinaceous food into the more assimilable products.

## NOW, WHAT IS DIASTASE ?

## SOME RECENT DATA RESPECTING DIASTASE.

From the elaborate researches of H. P. Wijsman ("Rec. Trav. Chim.," ix, 1-13) it would appear to be a highly interesting body. The author starts with the assumption that the Diastase of Malt is composed of a mixture of two enzymes—MALTASE and DEXTRINASE. The former converts starch into a mixture of maltose, and a dextrin which is coloured violet by iodine, and corresponds to the erythro-granulose of various experimentalists; the latter enzyme converts starch into a dextrin which reduces Fehling's solution, is not coloured by iodine, and which corresponds with the malto-dextrin of Herzfeld, of Brown, and of Morris. Malto-dextrin is converted into maltose by maltase-enzyme, and when dextrinase acts on erythro-granulose a dextrin is formed which does not reduce Fehling's, and is not coloured by iodine: this dextrin the author terms LEUCO-DEXTRIN. M. Wijsman goes on further to prove by experiments that this view is correct; but we have quoted enough, perhaps, to show how absolutely necessary it is to exercise the very greatest care during the manufacture of Malt Extract in regulating the heat employed, so as to protect so highly sensitive a constituent as Diastase from destruction. The Kepler Malt Extract has a world-wide reputation for its high diastatic activity, uniform composition, and superior flavour.

Kepler Extract of Malt supplied to the Profession in  $\frac{1}{4}$  and  $1\frac{1}{2}$ -lb. bottles at 1/8 and 3/- each.

A Lecture

ON THE

RHEUMATIC CARDITIS OF CHILDHOOD.

Delivered at the Hospital for Sick Children, Great Ormond-street, June 24th, 1892,

By OCTAVIUS STURGES, M.D., F.R.C.P.,  
SENIOR PHYSICIAN TO THE HOSPITAL.

GENTLEMEN,—The endo-pericarditis associated with rheumatism in children is by far the commonest of all the cardiac affections of early life, claiming no less than half of the whole number. The other half, mainly pericarditis, includes also a few examples of chronic valve disease and a yet smaller number of recent endocarditis apart from pericarditis. Thus the child's heart affections (congenital defects being excluded) are cast in two great divisions: one, peri-endocarditis, which is rheumatic, the other, pericarditis, owning a variety of causes, recent endocarditis by itself being so rare as hardly to count in the enumeration. But in giving to rheumatism a full half-share in the total of children's heart disease less than the truth is expressed unless a provision be added. Heart disease in the strictest sense is almost wholly rheumatic in these subjects. What remains applies to the heart's investment and is an accompaniment of morbid conditions wherein the pericardium sympathises, not with the endocardium, but with the neighbouring serous membrane of the lung. The two divisions are further distinguishable in the diathesis, the age, and even, to some degree, the sex that belongs to each. When, for example, we classify children's diseases as tuberculous and non-tuberculous, such a grouping applied to the heart would detach to the tuberculous side a large number of examples of pericarditis, but hardly one of peri-endocarditis. Cardiac affections in the strict sense are almost confined to non-tuberculous children, and almost always rheumatic. The peri-endocarditis of early life is in fact accurately and sufficiently described as rheumatic carditis. Similarly in regard to age. Such share as belongs to the tuberculous and is mainly pericardial will concern infants and young children. At a somewhat later age but still early comes pericarditis, related to pleurisy, to empyema, to pneumonia, sometimes to diphtheria and septicæmia. Later yet—that is to say, with the elder children—rheumatic peri-endocarditis (or carditis) becomes conspicuous; and last of all, when childhood is approaching its term, we get some glimpse of those after-results of cardiac inflammation which occupy so large a place in the heart disease of adult life.

As my authority for these statements and for what is to follow I put before you 100 cases of heart disease examined post-mortem at this hospital between June 28th, 1881, and April 3rd of this year (1892)—that is, for nearly eleven years. The cases are taken consecutively, congenital disease alone being omitted.<sup>1</sup>

One Hundred Fatal Cases of Heart Disease examined Post Mortem during Eleven Years.

Rheumatic (boys, 22; girls, 32) ... ..	54	} 100
Non-rheumatic (boys, 22; girls, 24) ... ..	46	
<i>Ages of the Rheumatic.</i>		
Between two and four years ... ..	2	} 54
„ four and six years ... ..	4	
Six years ... ..	6	
Between six and twelve years ... ..	42	
<i>Ages of the Non-rheumatic.</i>		
Four years and under ... ..	32	} 46
Between four and six years ... ..	5	
Above six years ... ..	8	
Age omitted ... ..	1	

Of the non-rheumatic, as you see, the great majority are infants and young children, while in the rheumatic the order of age is reversed, and it is the elder children that suffer most. The great majority of these are between six and twelve, pretty equally distributed. Below six there are but

<sup>1</sup> The tables were shown at the lecture; abstracts only are here printed to save space.  
No. 3600.

six children, and the two youngest of these are open to some doubt. As regards sex, it will be seen that the preponderance of girls is due almost solely to the rheumatic division. This extra liability to rheumatism on the part of females is, I believe, generally conceded, although in later life the greater exposure to weather on the part of men tends to obscure it.

The non-rheumatic heart affections of children, as has been intimated, are insidious in character and mostly consecutive to other diseases whose natural course they hardly modify. Thus purulent pericarditis sometimes accompanies empyema, but commonly remains undiscovered until death. Pericarditis may arise in the course of general tuberculosis, but it is a secondary and, in the circumstances, even an unimportant event, while the pericarditis of pneumonia, although sometimes discoverable in life, affords no particular indication for treatment and no great aid to prognosis. Of my forty-six non-rheumatic subjects empyema claims eleven (all of them children under six), tubercle has ten, diphtheria four, and pneumonia three. The rest are variously associated with meningitis, nephritis, and septicæmia.

Endocarditis, both new and old, occurring by itself is, as I have said, very rare. In the entire series of 100 cases it is found in but six, three rheumatic and three non-rheumatic. In two of the three reckoned rheumatic excess of fluid was found in the pericardium; the third was a case of old mitral disease in a child over eleven. In this case only was the pericardium normal. Of recent endocarditis, therefore, there is no single example amongst the rheumatic without participation in some degree on the part of the pericardium. As regards the three non-rheumatic examples of endocarditis, one is a case dying of diphtheria with "old thickening of the mitral," but no mention of the pericardium; the second is the case of a new-born child dying of pyæmia, and showing post mortem "vegetations upon the mitral and tricuspid valves," not further described; the third is the solitary example of the whole series, and, moreover, it is the solitary example of the entire 100 cases exhibiting recent endocarditis of the mitral valve with no pericarditis and no excess of fluid in the pericardium. Now observe, this same case was one of acute chorea, and it represents, as I believe and have elsewhere tried to show,<sup>2</sup> the condition of the heart proper to chorea apart from rheumatism. It is rarely observed, indeed, because fatal chorea is rare, and our post-mortem experience of it relates chiefly to the subjects of rheumatic heart disease.

It is not, however, my present purpose to discuss the non-rheumatic class of heart affections in children, made up as it is of examples having as little in common as empyema and diphtheria, chorea and tubercle. I desire rather to separate this miscellaneous group from the rest, so that the ground, being thus cleared, the features of rheumatic carditis may be the better displayed.

The general characters of the child's articular rheumatism, with which carditis so often concurs, are well known to you: slight fever, indistinct and fugitive joint affection, absence of prostration or of any abiding sense of illness. Such symptoms, though they may cover extensive heart inflammation, are not of a kind to excite the alarm of parents and not seldom pass unnoticed. What I would point out is the commonness of recurrence in child's rheumatism, or rather, let me say, the fact that the younger the subject the greater the liability to recurrence and the more closely are successive attacks crowded together. A child may encounter rheumatism once and, it may be, carditis therewith without permanent injury; but recurrent rheumatism—rheumatism that begins early and recurs often—is certain to cripple the heart, inasmuch that by far the greater number of fatal cases, perhaps all did we but know, are of that kind.

The statement may need analysis. In the fifty-six cases of fatal rheumatic carditis on which I am now commenting thirty-five of the number had certainly had rheumatism more than once. In five others the rheumatic attack had been unusually prolonged, or, as is more probable, if we may trust our common clinical observation, a succession of attacks happening near together seemed like one. There remain sixteen, or, omitting two cases without history and three where the history is doubtful, eleven wherein fatal heart disease resulted, so far as the history could be trusted, from a single rheumatic attack of no long duration. A further analysis of this remnant of eleven out of fifty-six is noteworthy. In four of them the existence of aortic disease and

<sup>2</sup> International Journal of the Medical Sciences, December, 1891.

of subcutaneous nodules made it at least likely that a previous rheumatic attack had passed unrecognised as such. In two, if not in three (there is some uncertainty), the children died, not of the heart disease, but of intercurrent affections. Thus a very small proportion of the fifty-six, some four or five, can safely be counted as victims of heart disease due to a single rheumatic attack. Nor would I surrender even these in view of the notorious fact that the joint pains of children when really rheumatic are not always assigned to that cause. It is certain that the vast majority of the fatal cases have suffered rheumatism more than once. It is not improbable that it is invariably multiple rheumatism that fatally affects the heart.

It is in the later attacks of rheumatic arthritis—as was shown at a demonstration here last March<sup>3</sup>—that physical signs in respect of the heart are most reliable. In a first attack there may be tumultuous action, mitral bruit becoming perhaps appreciably presystolic; exocardial sounds in great variety; reduplicated second, and even diastolic murmur at the aortic cartilage; but one and all of these morbid signs may disappear, and the integrity of the heart be maintained. Yet we cannot predicate that such will be the case until some time has intervened without return of rheumatism. With a second, and still more with a third rheumatic attack, there is far greater probability of permanent change and the establishment of the two main factors of organic disease in childhood—namely, mitral stenosis and pericardial adhesion. Apart from this consideration of probability derived from repeated attack, I do not know what physical signs there are conclusive of structural heart-disease in children except prolonged blowing murmur, thrill and change in the heart's size and shape. Thus the chief contrast between the child and the man would be this—that in the former pericardial signs are far more frequent, while endocardial signs remain for a somewhat longer space of time of doubtful significance.

Nevertheless, the judgment we may form from physical signs is in fact less precarious than it would seem from these considerations taken alone. It must be added, first, that in rheumatism peri- and endo-carditis almost always go together, so that the presence of the latter may be inferred from the presence of the former; and, secondly (whether the information conveyed be precise or not is a point I am coming to), it is beyond doubt that pericardial sound in the circumstances we are considering signifies pericardial inflammation. However uncertain, therefore, the interpretation of recent endocardial murmurs, their character may be safely judged by the company they keep. The real difficulty is less in diagnosis than in prognosis. We may be certain that rheumatic carditis exists; we may, and in recent cases we often must, be uncertain whether such carditis will permanently cripple the heart.

I proceed now to a further point in regard to the diagnosis of rheumatic carditis and one which finds ample illustration in the table before you, though it leads to conclusions not a little surprising. It is this. Admitting that pericarditis has distinctive physical signs, how far may these be relied on to indicate from day to day the precise state of the pericardium, especially as regards adhesion? In the acute rheumatism of adults large trust is placed in physical signs as faithful witnesses of the progress and termination of pericarditis. The character, duration, and extent of friction rub, its advent, disappearance, and reappearance are all carefully noted and appraised, inasmuch that when convalescence is reached a more or less confident opinion is expressed as to the probability of pericardial adhesion. Rarely, however, does the correctness of such opinion have to bear the test of actual inspection. Adults with acute rheumatism seldom die then and there. But the opportunity of verification thus denied to us in adults is afforded quite liberally by children—the opportunity, I mean, of seeing the physical condition of the inflamed pericardium so close to the time of hearing the noise it makes that sight and sound may safely be regarded as referring to one time. A large class of children, as I have said, are the subjects of multiple attacks of rheumatism in quick succession, each of which, while sparing or almost sparing the joints, will be attended by fresh carditis. After a number of such attacks the heart will sometimes very rapidly give in and the patients die of dyspnoea or pulmonary inflammation. It is of such children that my present collection is mainly composed, and to them I now appeal, in considering to what degree exocardial sounds inform us accurately of the condition of the pericardium.

For some years past it has *not been my frequent experience* to find post mortem, notwithstanding that friction rub had been audible shortly before, sometimes loudly and over a large area, yet that pericardial adhesion was present, and in some cases extensive as well as firm. I at first inclined to the belief that such adhesions formed very rapidly in children. Further examination, however, compels the conclusion not only that to-and-fro rub may concur with extensive adhesion, but also that a great variety of exocardial sounds, variously described as “squeak,” or “creak,” or “scräpe,” are not inconsistent with intimate union of visceral and parietal pericardium. *With children dying after repeated rheumatic carditis, rubbing or no rubbing, it is the rule to find adhesion and the exception to find the heart free; while at the same time it is the rule to hear exocardial rub and the exception to hear none.*

In proof of this assertion I call attention to the table before you. The cases selected were all rheumatic and all with endocarditis, though for brevity's sake the condition of the endocardium may be neglected.

Case 1.—L. C.—, aged eight, had “distinct friction,” together with mitral murmur and thrill *fourteen days before death*. Post mortem the pericardium is described as “firmly and universally adherent.”

Case 2.—M. F.—, aged seven, had “loud friction” with thrill and double murmur at apex *when last examined shortly before death*. Post mortem pericardial adhesions were “extensive and firm, but new.”

Case 3.—W. R.—, aged ten and a half, had at first slight friction, which later (that is, *eight days before death*) was described as “definite friction.” Post mortem the pericardium is described as “adherent all over and difficult to separate.”

Case 4.—A. B.—, aged eleven and a half, had “friction” *three days before death*. Post mortem the pericardium was “universally adherent by tough lymph.”

Case 5.—H. D.—, aged seven, developed friction rub while under observation, which was *audible up to death*. Post mortem the apex was “firm and organically united to the pericardium, which, however, was only partially adherent.”

Case 6.—L. B.—, aged eleven, had “excited heart action, friction and musical murmur at apex,” *signs which lasted till death*. Post mortem the “pericardium was firmly adherent by a band of tough lymph.” There were also some recent adhesions, but the right border was partly free.

So much for individual instances. Let me now estimate on a larger scale and from the same source the condition of the pericardium after death in relation to its living signs. The fifty-four cases of rheumatic carditis I am now dealing with may be divided into two classes, one where pericardial sounds were audible, the other where they were absent. The first or audible class may be again subdivided into (a) cases where exocardial sound is easily explained owing to the pericardium being roughened or lymph-covered yet not adherent and (b), strange to say, a larger class, where the existence of exocardial sound is less easily or not at all explained owing to the fact of pericardial adhesion in various degree, sometimes extensive and firm.

It thus appears not only that very extensive adhesion will often permit very obvious exocardial sound, but also, as I shall show directly, that we are not without examples of rough and lymph-covered yet not adherent pericardium, such as *ought*, as one is tempted to say, to yield sound, yet in fact yielding none. If we add that friction sound may possibly be present where there is no lymph and no roughness, and this is generally admitted, the simple teaching of the text-books that the successive stages of pericarditis may be followed by the ear from first to last seems to fade away with other delusions of youth.

*Exocardial Sounds (a) Audible and (b) Inaudible in 50 Cases<sup>4</sup> of Rheumatic Carditis examined post Mortem.*

(a) Exocardial sounds audible and of distinct rubbing character in ... .. .	29
An extra sound audible over and above the endocardial, but not a distinct rub in ... .. .	4

These 4 cases differ in no respect from the rest, but as the nature of the added sound in them may be deemed open to doubt they are excluded.

<sup>4</sup> The notes of 4 of the 54 rheumatic cases here analysed are defective or doubtful on this particular point.

*Condition of the Pericardium in the 29 Cases above mentioned as furnishing Distinct Pericardial Rub shortly before Death, described in the words of the Post-mortem Account.*

Pericardium is adherent "universally," "generally," "entirely," "everywhere," "universally and firmly," "extensively" in ... .. 15  
 Pericardium is "adherent and also to chest wall," "partly and recently adherent," "a few adhesions" in ... .. 5  
 Pericardium is not adherent, but there exists "pericarditis," or "roughened pericardium" or "shaggy cords" in ... .. 5  
 No adhesions mentioned (probably none existed) in ... .. 4  
 Thus, notwithstanding friction rub until near death, adhesion is firm and general in 15; less firm and less general in 4 or 5; and 9 only at the utmost are without or with slight adhesion.

(b) Exocardial sounds are inaudible in ... .. 17  
*Condition of the Pericardium in these 17 in the words of the Post-mortem Account.*

Pericardium "adherent throughout" in ... .. 6  
 Pericardium "adherent at apex," "partially adherent," "firmly but partially adherent" in ... .. 3  
 Excess of fluid in pericardium in ... .. 3  
 "Soft buttery lymph" in ... .. 1  
 "Recent lymph," "flakes of lymph," granular fibrin, "softly adherent" in ... .. 4

In 3 of the above cases classed as "adherent throughout," though there was no obvious exocardial rub, yet there was noted some extra sound of doubtful origin in addition to the endocardial murmurs. In one this is described as a "loud systolic whistling," in another as a "sibilant quality added to the murmur," and in a third as "a little musical systolic sound in addition to systolic and presystolic murmurs." Independently of these 3, however, we have here 7 cases of inflamed pericardium, 4 without and 3 with but partial adhesion, yet none of them yielding exocardial sound.

Putting the same facts in slightly altered shape, and omitting dubious cases where very partial adhesion might with equal probability be supposed either to admit of exocardial sound or to prevent it, it would seem that any precise diagnosis as to the condition of the pericardium derived from exocardial sound is just as likely to be wrong as to be right. Thus:—

1. Cases where, owing to the existence of inflammation, products described as "lymph," "granular fibrin" &c., the pericardium not being adherent, friction sound would have been expected and was heard. (Diagnosis correct.) ... .. 9
2. Cases of precisely similar character where friction sound would have been expected, but was not heard. (Diagnosis incorrect.) ... .. 4
3. Cases where, owing to the extent of pericardial adhesion or to excess of fluid or softness of lymph, friction sound would not have been expected and was not heard. (Diagnosis correct.) ... .. 10
4. Cases of precisely similar character where pericardial friction would not have been expected but was heard. (Diagnosis incorrect.) ... .. 15

So that diagnosis based upon absence or presence of exocardial sound would be correct in 1 and 3, that is, in 19; it would be incorrect in 2 and 4, that is again 19.

Upon the evidence now before you I take it for certain, explain the facts as you will, first, that pericardial adhesion does not prevent exocardial rubbing; and secondly, that the presence of such adhesion in fatal cases is much commoner than would be supposed judging from physical signs alone. Post-mortem observation, however, does not fully reflect the ways of life. What is true for those that die is not necessarily true for those who recover. Pericardial adhesion, in other words, may be a more sinister occurrence than we suppose, making sometimes the difference between living and dying. That wider question cannot be discussed with our present material, nor is it, indeed, determinable until the bearing of physical signs upon anatomical states as regards the pericardium has been more fully investigated and defined.

**SANITATION AT BRADFORD.**—The sanitary officers of Bradford have been instructed by the corporation authorities to require that in all new buildings water-closets shall be provided except where no suitable sewer is available for the drainage of such buildings.

## A Clinical Lecture

ON THE

### INTERSCAPULAR THORACIC AMPUTATION, WITH THE RECORD OF A SUCCESSFUL CASE.

By THOMAS F. CHAVASSE, M.D., F.R.C.S. Ed.,

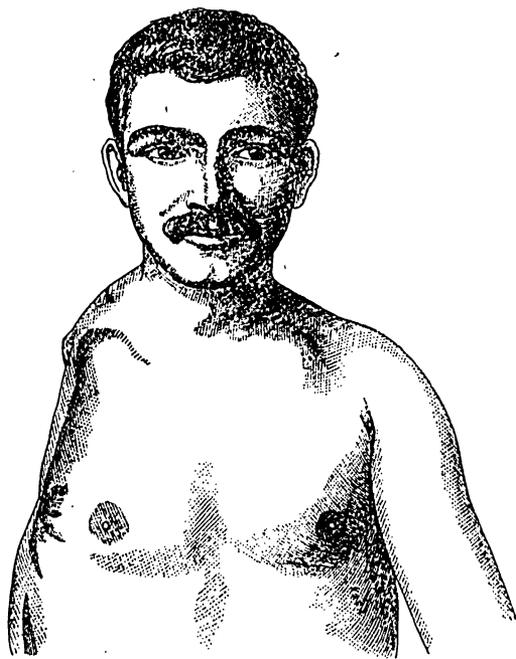

SURGEON TO AND LECTURER ON CLINICAL SURGERY AT THE BIRMINGHAM GENERAL HOSPITAL.

GENTLEMEN,—The interscapular thoracic amputation of the French surgeons consists of removal of the entire upper limb and the outer two-thirds of the clavicle. It may seem to you a formidable operation, but in actual practice, if certain steps are systematically followed, it will be found to be a straightforward procedure neither dreadful nor prolonged. In a rough-and-ready way, each surgeon proceeding in the manner most agreeable to himself, the operation cannot lay claim to novelty, for in 1808 an English naval surgeon, Ralph Cumming, removed successfully in the Greenwich Hospital for a gunshot injury the scapula, arm and clavicle of a sailor aged twenty-one years. He was followed in 1830 by Gaetani Bey at Cairo. Since then many other surgeons have placed upon record cases in which the operation has been completed for injury. It is not, however, my intention to consider in detail traumatic cases requiring such surgical interference, as every individual case is a law to itself, the operator having to shape and fashion the mutilated soft parts in a subject already in a state of profound shock. But cases of tumour in the vicinity of the shoulder offer entirely different features and in such a systematic plan with slight modifications can always be readily carried out.

George MacClellan of Philadelphia in 1838 claims to have been the first to have undertaken the operation to remove at one sitting the entire upper extremity for tumour, and according to Stephen Rogers he is entitled to such priority. In Great Britain Mr. Syme, in 1863, was the first operator and he was followed in 1865 by Sir Wm. Ferguson, but, in both cases, previous operations had been performed upon the parts, for the former had removed the head of the humerus and the latter a portion of the scapula. Most of the surgeons who immediately followed them first disarticulated at the shoulder-joint, and then removed the scapula and a portion of the clavicle. The credit of systematising the operation, placing it upon an intelligent and scientific basis and demonstrating how to safely remove the whole limb *en masse* rests with Dr. Paul Berger, the eminent Parisian surgeon, who in 1882, as the result of his observations, suggested the performance of the operation by the following steps: 1. The middle third of the clavicle is resected by an incision carried along the bone from the outer edge of the sternomastoid muscle to its acromial extremity. 2. The subclavius muscle and adjacent soft parts are dissected back, the subclavian artery and vein external to the scalenus anticus muscle are laid bare, and each vessel is secured with ligatures in two separate places, making a division of both artery and vein between such ligatures. The object of this step is to preclude copious hæmorrhage and prevent air entering the subclavian vein when severed. 3. An anterior or pectoral flap is to be formed. This is accomplished by beginning the incision at the middle of the clavicular one and carrying it downwards and outwards across the anterior fold of the axilla to the inferior angle of the scapula. The integument is then reflected and the pectoral and latissimus dorsi muscles divided, together with the cords of the brachial plexus. The previous ligature of the main artery renders the proceeding practically bloodless. 4. The affected arm is drawn forcibly across the chest, and the patient, being placed at the edge of the table, is rolled over on to the sound side so as to allow the formation of a posterior or scapular flap. This is effected by commencing at the acromio-clavicular articulation, where the first incision terminated and carrying the knife downwards across the posterior axillary fold to meet the anterior incision at the angle of the scapula. The skin is reflected to the posterior border of that bone, the rhomboid muscles, the levator anguli scapulae and the trapezius are divided and the

limb taken away. At this stage some hæmorrhage may be expected, as the blood-supply is derived from the posterior and supra-scapular branches of the second part of the sub-clavian artery. It is, however, readily restrained by the pressure of a large flat sponge until pressure forceps and ligatures can be applied. If these steps be carefully carried out the flaps will fall together without tension, and as drainage is readily accomplished healing takes place rapidly, more so, in fact, than when an ordinary shoulder-joint amputation has been performed. When malignant neoplasms have to be dealt with it is extremely likely that the integument, from which it is wished to form one of the flaps, is more or less involved and has to be taken away, so the ingenuity of the surgeon will be exercised to suggest some slight modifications of the skin incisions as may seem most suitable to the particular case.

The man before you, for the notes of whose case I am indebted to my house surgeon, Mr. Jerome, is twenty-one years of age, a groom by occupation, who was admitted into the hospital on May 16th, 1892, having noticed, five or six weeks before, a swelling on the right shoulder-blade, which he could not attribute to any blow or injury to the part. His general health had always been good, and there was no family history of malignant disease. On admission there was a tumour extending from the upper border of the right scapula, near the glenoid cavity, downwards to the lower angle and backwards nearly to the dorsal spines; it filled the axilla. In places, posteriorly, the skin was red and adherent to the growth, which was soft and semi-fluctuant to the touch, painless except

for some slight aching in the arm. The patient had been an inmate of another hospital, but after consultation had been dismissed as beyond relief by any surgical operation. On May 20th removal of the limb was effected as follows: the middle third of the clavicle was taken away and the third part of the subclavian artery secured with catgut ligatures. The corresponding vein was found to be enormously distended and in size equal to a large thumb, and to ligate it doubly was a matter of some little difficulty. As it was necessary to sacrifice a large portion of the skin which usually helps to form the posterior flap the anterior one was fashioned by commencing it at the tip of the acromion and curving it slightly forwards over the deltoid, then backwards to the axillary fold, and downwards to the inferior angle of the scapula. The posterior one began about the middle of the clavicle and was carried obliquely downwards to meet the previous one. After removal of the limb the flaps thus formed could be readily approximated except inferiorly, where a slight degree of tension resulted. A drainage-tube was inserted at the most dependent part of the wound. The after-progress was satisfactory, the immediate shock caused by the operation was soon rallied from, the pain experienced was slight,

the constitutional disturbances hardly appreciable and on May 28th he sat up out of bed. Two days later the wound was reported to be healed throughout except at the lower angle where it was granulating. Up to the present time (three months) the man has continued in vigorous health.

After examining the tumour Dr. Ratcliffe reports: "It is a small, round-celled sarcoma springing from the infra-spinatus muscle, not attached to the bone, and at its outer margin undergoing cystic degeneration."

The advantages of following out this systematic method are: 1. Excessive bleeding is prevented by securing the main artery before any extensive division of the soft-structures is commenced. Those parts with their blood-supply remaining unchecked are not dealt with until the last steps of the operation, when any bleeding can be readily and effectually restrained. Several instances are on record in which fatal hæmorrhage has resulted from the attempt to remove the whole limb without first securing the main artery.<sup>2</sup> 2. Air is prevented entering the subclavian vein. This accident has proved fatal in times gone by, both in traumatic cases and those undertaken for tumour. 3. Free division of the soft parts, as remote as possible from a malignant-growth, is permitted, and any axillary deposits detected can be easily and visibly cleared away. 4. The flaps are readily approximated and the facilities afforded for the drainage of a large wound are excellent. Hence primary union, the absence of septicæmic complications, and a speedy convalescence may be anticipated.

#### CASES RECOMMENDED FOR OPERATION.

1. *For traumatism.*—Injuries in the region of the shoulder in which the vitality of the immediate structures is rendered doubtful. By removal of the scapula it may be that sufficiently healthy flaps are secured so as to render a speedy healing of the stump possible; whilst if disarticulation at the shoulder-joint be performed sloughing of the contused parts, increased risk of septicæmia, healing by granulation and a tardy convalescence may have to be reckoned with. If there be actually any slight increase of shock by removing the scapula, it is more than counterbalanced by the advantages of obtaining healthy skin for flap formation. Stephen Rogers,<sup>3</sup> in his report of eleven cases in which the arm and scapula had been forcibly torn off by machinery, shows that in all there was but little hæmorrhage, not much shock, and that recovery was apparently prompt. It must, however, be noted that most of the subjects were young people.

2. *For neoplasms.*—A. *Simple*: Under this heading may be placed large osteo-chondromata springing from the upper end of the humerus and involving the soft parts in their growth. Such cases have been successfully operated upon by Syme, Berger, Heron Watson and myself. In the last instance the ablation was performed in January, 1889, and the patient is still alive and well. B. *Malignant*: In cases of sarcomata or other malignant type of growth originating in the humerus, in the soft parts in the region of the shoulder-joint, or in any portion of the scapula, in which the axillary glands are already involved when the patient comes under notice I would urge that the interscapular thoracic amputation should be resorted to if any operation be undertaken.

Some of you may remember the case of a patient, aged fifty-two, who was admitted into the hospital on May 8th, 1891, suffering from a sarcomatous growth the size of a small Tangerine orange, springing apparently from the inter-muscular septa on the outer side of the lower third of the right arm and implicating the skin. Amputation of the arm was advised and declined. On July 4th he was readmitted, having since he left the hospital been treated by the local application of caustics by a "cancer-curer." It was then seen that there was a crater-like ulcer, involving two-thirds of the circumference of the limb, extending as high as the middle of the humerus. The bone was exposed and several severe attacks of hæmorrhage had taken place. The entire limb was œdematous and the axillary glands were enlarged. Amputation at the shoulder-joint by skin flaps was performed next day, and the axilla as far as possible cleared out. He left the hospital apparently well on Aug. 16th. Microscopically the tumour was found to be a mixed-celled sarcoma with a preponderance of round cells. In February of this year the patient was again admitted, as the cicatrix was involved in a recurrent growth which had ulcerated and seemed adherent to the scapula and chest wall. He com-

<sup>2</sup> Vide Table of cases by writer in the Medical and Chirurgical Transactions, vol. lxxiii.

<sup>3</sup> American Journal of the Medical Sciences, vol. lvi.

plained of excruciating pain, only alleviated by opium, and was urgent that some operative effort should be made for his relief. He had lost much flesh, and could only take a minimum quantity of food daily. It was pointed out to him that his present condition was not a satisfactory one for any operation; but as he elected to take all risks involved, on Feb. 16th I removed the scapula and two-thirds of the clavicle by Berger's method, getting well clear of the sarcoma, removing all the pectoral muscles that remained, and exposing the ribs, but having sufficient skin flaps left to cover in the stump. At the time of the operation there did not appear to be much shock, and the patient subsequently expressed himself as nearly free from pain. He was, however, very restless and vomited all nourishment, so that nutrient enemata had to be resorted to, but he died exhausted on the evening of Feb. 18th, sixty hours after the operation.

Dr. Ratcliffe's post-mortem notes say: "Body fairly well nourished. Operation wound nearly healed. No signs of secondary growth in the lungs, the thoracic walls or abdominal organs."

I have little doubt that at the time of the first operation the axilla was not efficiently cleared. Although to the feel all the affected glands appeared to be removed, yet probably some infecting nucleus remained, and the recurrence of the growth was rapidly apparent. A wider operation, accompanied as it would have been by a visible clearing of the whole axilla, would, in my opinion, have afforded the patient a better chance of permanent recovery. Youth is not to be considered an objection to the performance of the interscapular thoracic amputation when malignant sarcomata have to be dealt with.

In February, 1883, I removed the entire right scapula of a girl aged twelve for a periosteal sarcoma involving both surfaces of the bone. Haemorrhage was free. Owing to the skin being involved there was hardly sufficient flap left to cover in the exposed surface, and the time occupied in the performance of the operation was as long as that needed for the major proceeding. The shock was great. The patient died the same day. At the necropsy infected axillary glands were discovered which had been overlapped during life by the primary growth, and so had escaped detection. In a similar case, with our present knowledge, I should remove the entire upper limb.

3. Mr. Frederick Treves<sup>4</sup> has advocated the performance of this operation in cases of "big arm" occurring late in mammary carcinoma, and reports a case in which, at least as a palliative measure, the immediate result was successful. An Italian surgeon, Domenico Morisani,<sup>5</sup> performed the operation for a breast cancer in March, 1885, upon a woman aged fifty-four; the entire upper limb, part of the clavicle, the mammary gland, and portions of the second, third and fourth ribs with their intercostal muscles being removed. Death resulted from shock, as the thoracic cavity was widely opened. The interscapular thoracic amputation and Berger's systematic method of performing it has only to be more widely known amongst English-speaking surgeons to meet with that recognition which I think its merits justly deserve.

## A NEW METHOD OF EXCISING THE TWO UPPER PORTIONS OF THE RECTUM AND THE LOWER SEGMENT OF THE SIGMOID FLEXURE OF THE COLON.

By H. WIDENHAM MAUNSELL, M.A., M.D. DUB.,  
GATE LECTURER ON SURGERY IN OTAGO UNIVERSITY AND LATE SENIOR  
HONORARY SURGEON, DUNEDIN HOSPITAL, NEW ZEALAND.

CHRONIC intestinal obstruction is usually met with in persons of advanced years, and the seat of obstruction is generally in the lower part of the large intestine. If the disease causing the obstruction invades any part of the gut from the stomach to the middle segment of the sigmoid flexure of the colon, it may be excised in the manner I have indicated in the March number of the *American Journal of the Medical Sciences*. I will now deal with cases of carcinomatous stenosis involving the rectum and the lower segment of the sigmoid flexure of the colon. Car-

cinomas invading the lower segment of the sigmoid flexure of the colon and the upper two-thirds of the rectum are tabooed by all practical surgeons as not amenable to radical treatment on account of their anatomical inaccessibility. All these cases are condemned to die either from the immediate effects of intestinal obstruction or, having been provided with an artificial anus in the loin or inguinal region, they are abandoned without hope to linger on for a few months until death relieves them from their loathsome condition. No operation has yet been devised for completely excising the rectum. Mr. Treves says, in his excellent "Manual of Operative Surgery": "Excision of the rectum or proctectomy is carried out in certain cases of malignant disease involving the anus or lower part of the rectum. The term is misleading inasmuch as the rectum is never excised, but only a comparatively small part of it. . . . Very rarely does the excised portion measure more than three inches in length." By experimental investigation I have ascertained that the semi-fixed condition of the upper three-fourths of the rectum is almost entirely due to peritoneal attachment; when this is severed it becomes an easy matter to invaginate any portion of it out through the anus where the diseased segment may be ablated and the continuity of the bowel restored in a surgeon-like fashion with little risk to the life of the patient. Before going any further I shall inquire into the relations of the peritoneal covering of the rectum in its normal condition. The upper three-eighths of the rectum in the adult is completely invested by peritoneum and is connected to the sacrum behind by a duplicature of that membrane called the "meso-rectum"; the length of the duplicature varies in almost every case. The middle portion is covered with peritoneum only on its anterior surface and the lower portion receives no peritoneal covering. On the posterior surface of the gut there is no peritoneum below a point five inches above the anus. What are the abnormal conditions commonly found in the peritoneal investment and what surgical affection is consequent on this abnormality? The upper portion of the rectum may have an abnormally long meso-rectum and the second portion may be completely covered with peritoneum and be connected with the sacrum by a meso-rectum. This abnormal condition is generally associated with true procidentia recti, where all the walls of the upper part of the rectum descend through the lower part and protrude outside the anus. This condition is a true intussusception. The only portion of the rectum fixed by the muscles and pelvic fascia is entirely below the upper limit of the levator ani, which is not more than an inch and a half from the anus. Above this point the straight gut is merely suspended by a reflexion of peritoneum. If the disease invades the lower third of the rectum the most satisfactory method of ablation is by a modification of Professor Verneuil's posterior dorsal incision, whereby complete sphincter power may be retained after the operation.

Should the disease attack any portion of the upper two-thirds of the rectum or the lower segment of the sigmoid flexure of the colon the procedure is as follows:—

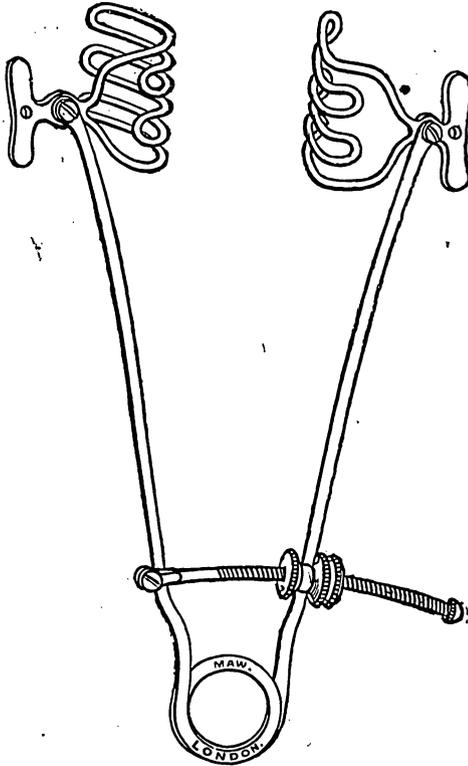

1. For a few days previously to operating the patient is fed with small quantities of farinaceous food and beef-tea.
2. Night and morning the stomach and lower part of the rectum are thoroughly irrigated with hot water and salt (half a drachm to the pint).
3. The lower portion of the rectum and anus below the carcinoma is cautiously dilated with a small Barnes's bag or bivalve vaginal speculum, well greased with iodoform ointment.
4. The patient is kept in bed, and the surface of the abdomen and perineum is rendered thoroughly aseptic with nail-brush, soft soap, shaving and bichloride solution. Previously to operating the limbs and upper part of the chest are covered with wadding and the patient placed on a portable rubber operating mattress filled with hot water, as made to my order by Maw, Son and Thompson.
5. When thoroughly under the influence of an anæsthetic the patient is placed in the lithotomy position.
6. The assistant surgeon sits at the end of the operating table. He first divides the sphincter ani backwards towards the coccyx with a straight probe pointed bistoury and then passes a large bivalve vaginal speculum or Bruce Clarke's three-bladed bladder speculum through the anus up to the cancer. Holding the speculum in position he cautiously dilates the lower end of the rectum. The free division of the sphincter ani prevents the subsequent distension of the rectum with flatus and the possible tearing out of the circumferential sutures.

<sup>4</sup> THE LANCET, vol. ii, 1891.  
<sup>5</sup> Il Morgagni, Agosto-Ottobre, 1885.

7. The bladder is now thoroughly emptied and a median abdominal incision is made down to the peritoneum from a point one inch above the umbilicus to the pubes. All bleeding having been stopped, the peritoneum is slit up to the size of the external wound.

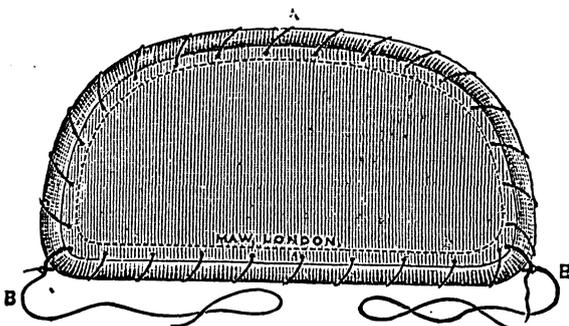

8. The edges of the wound are separated with a steel wire laparotomy speculum (Fig. 1) and the diaphragmatic intes-

FIG. 1.

tinal retractor, formed of a wire framework four inches wide and seven or eight inches long, covered with two or three layers of aseptic gauze, is placed in position. With a long-handled, slightly curved needle with an eye near the point two thick silk sutures are passed which are attached to the lower corners of the wire frame (Fig. 2) out through the walls of

FIG. 2.

A, Wire intestinal retractor or diaphragm, 7 in. or 8 in. long and 3½ in. to 5 in. wide; frame made of copper wire run through thin rubber tubing and covered with two or three folds of aseptic gauze. B B, Strong silk threads attached to the lower angles and border of the diaphragm.

the abdomen on either side, immediately above the crest of the ilium and two or three inches externally to the outer border of the quadratus lumborum. The portion of gut to be operated on is isolated and the rest of the intestines are lifted out of the pelvis and tucked securely above the lower rim of the wire frame. The sutures are made taut and fastened to the laparotomy speculum. The diaphragm keeps the intestines warm and well upwards and backwards out of the

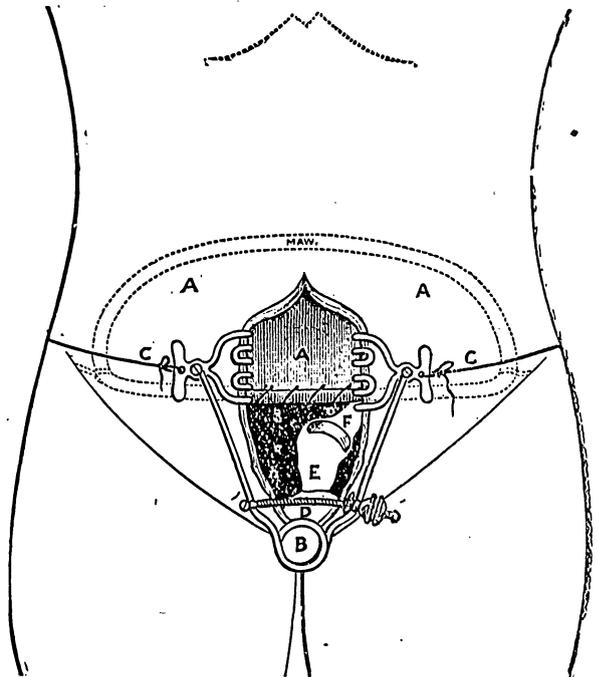

pelvis. The operator has an unobstructed view of all the pelvic organs and is master of the situation. (Fig. 3.)

9. If there is an accumulation of faeces above the cancerous stenosis, it is gently pressed back into the colon with the fingers and thumb. The displacement of the faeces from the vicinity of the seat of operation greatly facilitates the subsequent artificial invagination of the diseased segment of gut.

10. With a long packing needle a piece of broad tape is passed through the proximal side of the cancer, first on one side and then on the other; the assistant then drags the ends of the tape out through the speculum with a sequestrum forceps. The broad loop of tape now lies across the proximal side of the diseased segment of gut.

11. A small incision with a tenotomy knife is made through the entire thickness of the peritoneal fold between the rectum and bladder in the male or the rectum and uterus in the female. The upper part of the rectum, held between the finger and thumb of the left hand, is drawn out from the sacrum so as to

FIG. 3.

A A A, Intestinal retractor or diaphragm lifting intestines upwards and backwards. B, Steel wire spring laparotomy speculum with screw regulator. F, Loop of tape across the proximal side of the cancerous gut.

render its peritoneal attachments taut. A pair of long pointed angularly curved scissors (Fig. 4) is passed into the opening made with the tenotomy knife and the peritoneal attachment of the rectum is completely divided, first on the left side and then on the right. During the division of the lateral reflexions of the peritoneum it is imperatively necessary to keep the probe point of the lower blade of the scissors pressed well upwards and outwards from the median line of the gut against its inner surface. In this way, and in this way only, it is possible to divide the peritoneal duplicature which forms the meso-rectum without injury to the vessels, nerves and lymphatics of the rectum.

12. Provided the lower portion of the rectum is sufficiently dilated with the speculum, there is now no anatomical impediment to the invagination and complete prolapse of the upper three-fourths of the rectum out through the anus. The loose cellular tissue, with its contained vessels, offers no resistance. One or two vessels may be accidentally injured, but these can be easily dealt with in the usual way. No more of the peritoneal reflexion should be divided than is absolutely necessary to permit of the invagination out through the anus. The method I have advocated for peritoneal detachment applies with equal force to all parts of the colon. The inner reflexion of peritoneum requires most care in

division, as the vascular supply of the gut comes from that side. As the prolapse is drawn well down the blades of the speculum should be slightly approximated so as to permit of their easy withdrawal from the anus.

13. A catheter should be passed into the bladder to make certain that it is absolutely free.

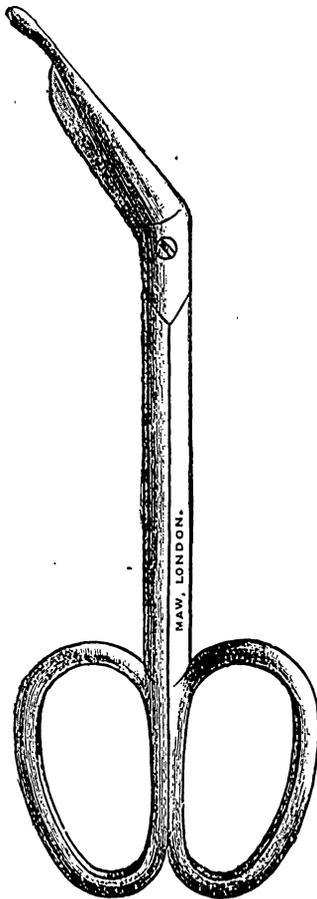

14. The prolapsed bowel is washed with warm, very dilute bichloride solution and a small incision made with a tenotomy knife through the entire thickness of the returning or middle layer of the intussusception and as near its apex as the disease will safely permit. The probe-pointed angularly curved peritoneal scissors are passed in through the opening made with the tenotomy knife, the prolapse being cut all round so as to completely free the entering or inner layer.

15. The inner layer is now pulled down with a vulsellum forceps until all the diseased portion appears completely outside or below the cut border of the returning or middle layer.

16. The inner and middle layers of the intussusception, about an inch above the disease, are transfixed with two fine long straight needles armed with chromicised gut.

17. The entering or inner layer is now amputated a full

FIG. 4.

half inch above the cancerous mass. Transfixing with long needles the entering and returning layers of the intussusception previously to amputation of the cancer prevents it from flying back inside, and ensures the proper relative position of the different layers of the bowel previously to sewing them up. The cancerous mass having been amputated, the needles are passed through and the sutures picked up in the middle of the invaginated bowel, divided and tied on both sides; the ends of the four sutures left long, so that an assistant can hold the cut ends of the bowel in position until it is plugged with absorbent wool previously to completely suturing it up circumferentially. Twelve passages of a long straight needle through both sides of the gut as above described suffice for the introduction of twenty-four sutures, which are generally sufficient. Nearly half an inch of the entire thickness of the coats of the gut should be included in each suture.

18. Before cutting off the four long sutures, the plug of

absorbent wool is removed, the wire intestinal retractor loosened and a long tube is passed up the colon, which is washed out thoroughly with hot water and boracic or salicylic acid. All hardened faeces should be assisted along the colon by the fingers and thumb within the abdomen.

19. When the whole colon is thoroughly irrigated the sutured ends of the bowel should be dried with absorbent wool and painted over with Wœtler's mixture of alcohol, glycerine and colophony, the same that he applies to the surface of the raw stump after removal of the tongue. The whole of the prolapse is now insufflated with iodoform and amorphous boracic acid and the bowel gently returned. The return of the circumferentially sutured bowel is facilitated by slight pressure from below and gentle traction from above. The rectal peritoneal reflexion which was divided is now sewn up with a few interrupted sutures to prevent any subsequent prolapse of the gut.

20. The laparotomy speculum and intestinal retractor are next removed and the median abdominal wound sewn up.

In this operation it is absolutely necessary to have two good assistants, one to administer the anæsthetic and another to assist in the invagination of the diseased segment of gut through the speculum. From aseptic considerations the laparotomist should leave this part of the operation entirely to one of his assistants. For the first day or two after the operation the patient should sip large quantities of hot water day and night. After the first few hours the patient gets to like it, as it allays sickness, disperses flatulence and helps to keep down the temperature by acting freely on the skin and kidneys. In extensive laparotomy cases I have had more success with hot water than any other remedy. After the first twenty-four hours the patient may be cautiously fed with small quantities of farinaceous food, chicken broth and whisky-and-water. If the carcinoma unfortunately has not been diagnosed early, and intestinal obstruction has been going on for some time, it may be deemed advisable to establish a temporary artificial anus in the left lumbar region, so as to thoroughly evacuate the colon, permit of its contraction to normal dimensions, and provide absolute physiological rest for that portion of the gut to be excised with the disease. Ten days after the excision of the cancer the artificial anus may be closed up by breaking down the parietal adhesions, sewing up the turned-in rarefied edges of the longitudinal opening in the descending colon and replacing it in its normal position.

For what pathological, anatomical or congenitally abnormal conditions of the lower end of the large intestine is this operation especially applicable?

1. Cancers of the upper two-thirds of the rectum and the lower segment of the sigmoid flexure of the colon.

2. Tertiary syphilitic ulcerations of the middle and upper portions of the rectum not amenable to medicinal treatment. This condition should be regarded as a new growth and excised as I have indicated.

3. Procidencia recti: this acrobatic accomplishment of the rectum is very common in tropical climates after an attack of dysentery. On three occasions I have seen the rectum completely turned inside out and the sigmoid flexure of the colon form the centre of the prolapsed gut. Cases of this kind not amenable to any medicinal treatment should be dealt with by median abdominal section in the manner I have indicated and the prolapse prevented with mathematical certainty by folding the meso-rectum upon itself in a direction parallel to the gut and fixing it in that position by silkworm gut sutures. This operation is much simpler, less dangerous and more effectual than that of McLeod of Calcutta or that of Roberts of Philadelphia. On two occasions I have seen Van Buren's method of linear cauterisation signally fail to prevent the subsequent invagination and prolapse of the rectum. The ablation of procidencia ani by the knife, the scissors or an écarateur of any kind, without median abdominal section, is a reckless surgical procedure, as a knuckle of small intestine may be herniated with the intussusceptum.

4. Congenital absence of the anus and the lower portion of the rectum. The child should be placed in the lithotomy position and a longitudinal incision made exactly in the median line over the site of the absent anus. The dissection must be made slowly upwards in the middle line. If after careful dissection *in situ* the operator fails to strike the bowel, instead of making an artificial anus in the loin or groin which gives the infant no chance of ultimate recovery, he should perform median abdominal section, avoiding the umbilicus. Having found the end of

the colon and freed its peritoneal attachments with the probe-pointed scissors, as already described, it is pulled down to its normal position at the bottom of the true pelvis and sutured deeply to the skin and circumanal structures.

Professor Kraske's method of extirpating the rectum through the sacral region (posterior laparotomy) and Professor Rehn's modification of it are inadvisable, as they involve unnecessary mutilation of important anatomical structures. Dr. Axel Iversen of Copenhagen records nineteen cases of this operation with eight deaths. I have seen five cases operated on by three of the most expert surgeons in Europe and two of them died within a week from shock and fecal infection.

In intestinal resection nature speaks with no uncertain voice. Ablation by invagination is the only method she countenances for the removal of any portion of the gut from the stomach to the anus. Decalcified bone-plates, tubes and the like makeshifts must be abandoned, and the silent dictates of nature, which are those of sound common sense, will be adopted. What general practitioner of large experience has not seen cases of prolapse of the upper portion of the rectum and the lower segment of the sigmoid flexure of the colon protrude at the anus? Every part of the colon from the ileo-caecal valve to the end of the sigmoid flexure of the colon has been invaginated and the apex of the intussusceptum has protruded at the anus. Dozens of cases may be quoted where pedunculated lipomas have caused invaginations in every part of the large intestine—the polypus drags that portion of the intestine to which it is attached into the segment of the bowel below and it is always attached to the apex of the intussusceptum. Numerous cases of acute invagination have been reported where unassisted nature effected a cure by sloughing and elimination of the intussusceptum. In these cases the continuity of the gut is restored at the neck of the intussusception by firm adhesions before the intussusceptum sloughs off. Several cases are recorded where five or six feet of the ileum sloughed off in this way, and one patient lived seven months after the successful excision by nature of the caecum, vermiform appendix and six or seven feet of the ileum. According to Mr. Treves spontaneous elimination takes place in about 40 per cent. of these cases.

In the performance of most pelvic operations I find the facilities supposed to be afforded by the adoption of Trendelenburg's position are to a great extent fallacious. Sponges only fill up the abdomen and do not retain the omentum and intestines in the position most convenient for the operator. Assistants' hands occupy too much room and are often in the way. In order to simplify the surgical technique of all operations in this region I have recourse to the use of a wire intestinal retractor or diaphragm, to be used in conjunction with the steel wire laparotomy speculum already alluded to. In cases of much intestinal distension, before inserting the wire retractor or diaphragm, I pass a fine trocar in one or more places and remove the flatus. On withdrawing the trocar I close the opening with a very fine curved conjunctiva needle and thread. The ease of performing all intra-pelvic operations increases with the size of the median abdominal incision. I never work in the dark when it can be avoided. To lessen shock, all cases of extensive abdominal section should be performed on a portable rubber operating mattress, filled with hot water; the patient is kept warm, and to a great extent dry, as provision is made for carrying off the water where much peritoneal flushing is required.

During the years 1881 and 1882 I tried several methods of enterectomy and finally came to the following conclusions:—

1. Where it is necessary to excise any portion of the bowel for disease or injury from the stomach to the anus an artificial invagination should be made if it does not already exist, as in pathological irreducible intussusception, and the invaginated bowel pulled out where necessary (it is unnecessary in the rectum and lower part of sigmoid flexure of colon) through a longitudinal slit made in the intussusciptum, cut off, and the divided ends of the gut sewn all round with interrupted sutures, then withdrawn, and the longitudinal slit closed with a continuous suture. The perfection of this operation is best gauged by its simplicity and the universality of its applicability to all parts of the intestinal canal from the stomach to the anus.

2. Circular enterorrhaphy is a surgical poser which requires some solving. The operation of enterectomy which I have described is the only one yet devised where the perfect union by suture of a complete transverse section of the bowel, with its circumferential peritoneal surfaces in exact position and all the knots of the sutures on the inside can be accomplished. If the sleeve is torn from a coat it is sent to a tailor. What

does he do? Does he attempt to sew it from the outside in the elaborately complicated fashion advocated in the textbooks on intestinal surgery, only taking up a small part of the thickness of the cloth in each stitch? No. He invaginates the sleeve and sews it on circumferentially from the inside, passing all the stitches through the entire substance of the cloth. In this way, and in this way only, can a perfect juncture be made between the coat and the sleeve, and when the invagination is withdrawn none of the stitches can be seen from the outside. Firmly suturing all the coats gives great healing capacity to the cut ends of the gut and the stitches are not likely to cut out.

The Czerny-Lembert method of suturing the bowel causes great delay. The surgeon has to pick up carefully the peritoneal and muscular coat of the bowel thirty or forty times if possible without perforating the mucous coat. The double line of sutures may cause gangrene between the stitches.

4. Where enterectomy is performed for gangrene injury or intussusception, the distal segment of the bowel is generally the largest, but where the operation is performed for stricture, cancer or tumour pressing on or constricting the lumen of the gut, the upper or proximal portion is often much larger than the lower.

5. In circular enterorrhaphy all the interrupted sutures should be passed directly through all the coats of the gut, taking up a quarter of an inch of the cut ends of the bowel with each interrupted suture, so as to make a perfectly air and water tight juncture.

6. This rapid and effective method of suture does not interfere in the slightest with the subsequent perfect permeability of the gut.

7. There is less risk of septic peritonitis following this method of suturing than the long and tedious method of taking up the serous and muscular coats from the outside.

8. In circular enterorrhaphy external sutures are not alone unnecessary but positively injurious, as they materially increase the time and the subsequent risk of the operation.

9. A continuous suture should never be used inside or outside a transverse section of the gut for the following reasons. Its diameter is always varying. As the stitches would not all cut out simultaneously they are apt to form loops inside the intestine, which would be liable to catch or be dragged or torn out by the onward movement of the contents of the bowel. Stanhope-gardens, S.W.

## MALFORMATIONS OF THE LOWER LIP.

By STEPHEN PAGET, F.R.C.S. ENG.,

SENIOR ASSISTANT SURGEON TO THE METROPOLITAN HOSPITAL AND TO THE WEST LONDON HOSPITAL.

MALFORMATIONS of the lower lip are so rare that it may be worth while to note the cases that have from time to time been published. Beside those alterations in the shape and size of the mouth—imperforate mouth, macrostoma &c.—which are hardly to be reckoned as true malformations of the lips, there are clefts, outgrowths and depressions of the lower lip as distinct and definite as are the different forms of ordinary harelip.

1. *Median cleft of the lower lip.*—Dr. Hamilton has recorded this malformation in a child, in whose family were several cases of ordinary harelip. The child also had talipes equinovarus. The lip was cleft for about a third of its depth; the edges of the cleft were of the colour of the mucous membrane of the lip; its angles did not present the rounded tubercles so often found in clefts of the upper lip. Dupuytren mentions a case of "median fissure of the lower lip and lower jaw," and Fergusson has figured the defect in his "Progress of Anatomy and Surgery." Mr. Bland Sutton gives the case of a child in whose lower lip was a median cleft having between its edges a dermoid growth; and Dr. Walker has reported a median cleft of the lower lip of a calf, with a cleft of the jaw and of the tongue.

2. (*a*) *Hypertrophy of the mucous membrane.*—In a case under Mr. Bryant's care an infant had an outgrowth of indurated mucous membrane on the right half of the lower lip; and in a case under Mr. Clutton a woman with cleft palate had also a triangular fold of mucous membrane on the inner surface of the lower lip in the middle line, and at the base of the fold were two small pits in the lip, like the openings of sinuses.

More often the hypertrophy is of that form which French surgeons have called "lèvre double" or "bourrelet labial"—a long fold of mucous membrane lying behind the lip and resembling it in shape. This fold may exist in either lip, or in both; in the upper lip it is interrupted by the frænum, in the lower lip it is uninterrupted the whole length of the lip. It is hidden when the mouth is closed, and the patient may at other times keep it out of sight by sucking it back; but it is made conspicuous by contraction of the orbicularis, as in laughter. Lips thus deformed are apt to become dry, cracked and ulcerated, and their unsightly aspect may, as in a case recorded by Dr. Wright, be the cause of grave mental depression. Inside these folds the hypertrophied labial glands can be felt: small shotty nodules, the size of hempseeds. In some cases this form of hypertrophy of the mucous membrane is not truly congenital, but is due to an unusual length of the frænum of the lip, which has caused the patient to have a habit of sucking and fidgeting the lip with his tongue; in other cases the hypertrophy of the labial glands may precede and cause the hypertrophy of the mucous membrane which enfolds them. But in other cases it appears to be a true congenital hypertrophy of mucous membrane, such as occurs also under the tongue. In all cases the only treatment is free removal of the whole fold and of the glands contained in it, and care must be taken that all glands cut across in the line of section or lying in the wound be also removed.

(b) *Hypertrophy of the whole lip.*—M. Buisson's statement that this form of hypertrophy is more common in the lower than in the upper lip is not supported by the records of these cases, at least as regards congenital hypertrophy. Mr. Davies-Colley has published a case of enormous hypertrophy of the lower lip in a man of thirty-six, but this was due not to congenital overgrowth, but to irritation from syphilis and from smoking. Dr. Buck, however, has recorded the case of a man whose lower lip had been abnormally large from birth; he had also a nævoid stain on the chin and cheeks. The lip had been made worse by repeated exposure to cold and was at the time of observation a soft pendulous mass more than twice the size of the upper lip. I can find at the time of obstruction no cases of congenital cystic enlargement—"lymphangioma"—of the lower lip. The cases quoted here were treated with complete success by excision of a wedge of tissue from the whole length of the lip.

3. *Sinuses of the lower lip.*—This curious malformation of the lower lip, so closely allied to common harelip as to alternate with it through different members of the same family, is perhaps to be explained by comparing with it the following case published by Dr. Hamilton. An infant with double harelip, one of a family in which there had been several cases of harelip, had on its lower lip, which was loose and prominent, two small symmetrical papillæ, like little nipples, growing from the red edge of the lip. These papillæ fitted exactly into the clefts of the harelip above them, so as just to fill them when the mouth was shut.

In close relation to Dr. Hamilton's case is a case published by Professor Madelung, of an infant with double harelip and cleft palate, on whose lower lip were two papillæ the size of a pin's head. These papillæ lay buried in minute culs-de-sac in the lip, from which a mucous fluid could be pressed out, derived from the glands of the mucous membrane which lined the culs-de-sac.

These two cases show two stages of the same malformation. In the first case the papillæ stood up from the lip, and fitted closely into the clefts in the upper lip. In the second case they were retracted, as the nipples of the breasts may be retracted, so that they lay in little pits or culs-de-sac on the surface of the lip. If now the papillæ be further retracted they will disappear altogether, leaving two sinuses or saccular depressions in the lip, lined with mucous membrane. These sinuses have been noted by several authorities. The cases are as follows:—

1. A girl, who also had talipes equino-varus, a divided nail on the great toe, a web of skin in the popliteal space, and a double harelip and cleft palate, and had sinuses on the inner aspect of the lower lip, one on each side of the middle line.—Trélat.

2. A boy with double harelip, whose father also had harelip, had on the front of his lower lip two slits leading into two small sinuses under the mucous membrane on the inner aspect of the lip. They secreted, especially at meals, a clear viscid neutral fluid.—Arbuthnot Lane.

3. A girl had on her under lip, which was full and fleshy, two crescentic openings near its free edge, admitting a large

probe for half an inch and secreting glairy mucus.—Jardine-Murray. The girl's history was as follows:—Father's mother, palate very high and narrow; father, double harelip, culs-de-sac in lower lip; first child (female, the patient), culs-de-sac in lower lip; third child (female), double harelip, culs-de-sac in lower lip; fifth child (female), palate very high and narrow; seventh child (male), webbed fingers; eighth child (male), harelip, culs-de-sac in lower lip.

To these three cases others might be added. M. Dépaül had one where, as in Professor Madelung's case, there was a small red granulation at the bottom of each cul-de-sac. M. Demarquay found in three families ten cases; nine of them had also harelip. Professor Madelung quotes other cases. He observes that the flow of mucus may be so free as to be troublesome, that the fibres of the orbicularis form a sort of sphincter round each opening that a fine ring of skin has been noted round them, and that the culs-de-sac, usually convergent, were in one case divergent.

If treatment is needed it is not enough to lay open the culs-de-sac; they must be cauterised or dissected out.

The explanation of this deformity is plainly to be found in its constant association with harelip. If the lips of the fœtus were closed while their curves were being formed any cleft in the upper lip would leave room for a corresponding upgrowth of the lower lip, as in Dr. Hamilton's case, in the same way as the curves of the two feet fit into each other in those cases of talipes which are due to the interlocking of the feet in utero. In Dr. Hamilton's case these upgrowths remained unaltered at birth; in Professor Madelung's and M. Dépaül's cases they were retracted as the nipple of the breast may be retracted; in the other cases they were wholly retracted and smoothed away, leaving behind them only the invaginated mucous membrane. In the same way, along the lines of the branchial clefts, one case may present an outgrowth, another a sinus or a mere pit in the skin.

Wimpole-street, W.

## THE IMPORTANCE OF OBSTRUCTION TO THE OUTFLOW OF URINE AS A CAUSE OF PUERPERAL ECLAMPSIA.<sup>1</sup>

By W. GIFFORD NASH, F.R.C.S. Eng.

THE theories as to the methods of production of albuminuria and eclampsia in pregnancy are many. Amongst others they have been attributed to vaso-motor anæmia of the kidneys due to reflex irritation of the pelvic plexus of the sympathetic nervous system, to alterations in the renal circulation due to the rhythmical contractions of the uterus, to increase of the general arterial tension, to a hydræmic state of the blood, and quite lately a bacillus is said to have been found. Scant justice has been done to the mechanical element in the question. By this I do not mean pressure on the inferior vena cava and renal veins, which many writers have suggested as the cause, but which can only act in the later stages of pregnancy, and which would produce congestion of the kidneys, whereas anæmia of the kidneys is the usual condition found on post-mortem examination of women who have died from eclampsia. I would, however, point out how pressure on the ureters, bladder and urethra may cause albuminuria and eclampsia, and how many, if not all, of the symptoms preceding and accompanying the fits may readily be explained when examined from this simple mechanical point of view. The majority of writers have almost entirely neglected pressure on the ureters and the consequent production of hydro-nephrosis and later chronic interstitial nephritis. There is, however, one prominent exception. Galabin,<sup>2</sup> after referring to the greater frequency of eclampsia in primiparæ and the influence of pressure on the abdominal viscera in producing it, says: "Pressure on the renal veins is not the only thing to be considered. There is another mode in which pressure comes into play, which has been scarcely included among the theories of the causation of albuminuria, which are enumerated by authors. I refer to pressure upon the ureters, which is exercised by the pregnant uterus even in the earlier months of pregnancy. It is known to pathologists that in the

<sup>1</sup> A paper read at the annual meeting of the South Midland Branch of the British Medical Association on June 16th, 1892.

<sup>2</sup> Brit. Med. Jour., vol. ii. 1880, p. 698.

case of fibroids of no great size some dilatation of the pelvis of the kidneys and flattening of the apices of the pyramids may be found. The more temporary enlargement of the uterus in pregnancy is not likely to leave such manifest changes. But the secreting cells of the kidneys must do their work against greater pressure and with more difficulty, and so be more liable to functional irritation and disturbance." I believe, however, that pregnancy may cause the manifest changes in the kidneys and ureters mentioned above, for amongst the post-mortem changes found in these cases Herman gives dilatation of the ureters and pelvis. Another writer (Winckel) says he does not think pressure on the ureters the cause of eclampsia, as he has often found dilated ureters in pregnant women who have not had any sign of eclampsia. One might as well argue, as some have done, that renal disease does not cause eclampsia because some women with chronic Bright's disease escape it. This statement of Winckel's that hydro-nephrosis is often found in pregnant women is strong evidence of pregnancy being able to cause it.

Let us consider what is the cause of eclampsia. I think we shall come to the same conclusion as Spiegelberg,<sup>3</sup> who says: "The renal disorder is by far the commonest cause; it includes all the worst outbreaks of the disease. I think therefore I shall not go wrong if I, broadly speaking, only regard that eclampsia as puerperal which is due to intoxication of the constituents of the urine." To what constituent of the urine is this intoxication due? Playfair<sup>4</sup> says: "The convulsions of eclampsia are due to toxæmia resulting from the retention of urea in the blood." I think we must go further and agree with Spiegelberg that uræmic intoxication depends on the retention in the blood of all the substances which should be excreted by the kidneys.

In pregnancy we have to consider the fact that the foetal urine has to be excreted by the mother's kidneys, and this may perhaps account for eclampsia being caused by the pressure of a pregnant uterus on the ureters, whereas it is not caused by the pressure of uterine fibroids or large solid ovarian tumours. In twins this factor would be doubly important, and we shall see presently that eclampsia is especially frequent in twin pregnancies. There seems to be no doubt that urine is secreted by the foetal kidneys during the latter half of intra-uterine life, and that the urine passes into the amniotic fluid, whence it finds its way into the maternal circulation and has to be got rid of by the maternal kidneys. This would throw an extra strain on them, especially if there were any obstruction to the outflow of urine. The evidence derived from the occurrence of hydro-nephrosis in the foetus shows that the kidneys of the foetus are active. The conclusions arrived at by Henry Morris<sup>5</sup> on this point are (1) that the urine is secreted in considerable quantity during the last four months of intra-uterine life; (2) that the quantity is too great to be stored up in the foetal passages; (3) that the urine secreted passes into the liquor amnii; (4) that the quantity of urea in the liquor amnii is small, but in the later stages of gestation it is fairly constant; (5) that the presence in the liquor amnii of urea and other constituents of normal urine gives support to the inference drawn from cases of congenital hydro-nephrosis—viz., that the liquor amnii is in part composed of urine of the foetus. Spiegelberg,<sup>6</sup> writing on the same subject, says: "The liquor amnii always contains albumen, and almost always urea, especially during the later months. The urea is unquestionably derived from the kidneys of the foetus. A portion of the urea passes back into the maternal circulation, either directly or after undergoing decomposition. In cases where the foetal urinary passages are occluded or kidneys absent the amount of liquor amnii is almost always extremely small." Granting that eclampsia is in the majority of cases due to deficient elimination by the kidneys, let us see how this is brought about.

Eclampsia occurs in pregnancy, during labour, or shortly after it. In pregnancy it is rarely seen before the sixth month—i.e., not till after the uterus has risen out of the pelvis and is able to compress the ureters at the pelvic brim. Cases occurring before the fourth or fifth month may be accounted for by the uterus being retroverted or retroflexed, and if we look at the description of retroversion of the gravid uterus in Playfair's work we shall easily understand how retention of the constituents of the urine may be brought about. He

says: "Retroversion of the gravid uterus shows itself about the fourth month. The first sign is generally some trouble with micturition in consequence of pressure on the urethra. The bladder may be enormously distended, cannot be emptied, and is constantly dribbling. Sometimes the obstruction to the discharge is so great as to lead to dropsical effusion into the cellular tissue of the arms and legs. Retention of urinary elements may take place and death occur with all the symptoms of uræmic poisoning." Obstruction may also be due to retroflexion, for amongst the causes of hydro-nephrosis given by Morris, Newman, and Fagge are pregnancy, prolapsus and retroflexion of the uterus, the latter of which causes bending or kinking of the ureters as they pass by the neck of the womb. After the fourth month the ureters can be compressed by the pregnant uterus, which pressure goes on increasing until delivery, and with it the liability to eclampsia. During labour, when eclampsia usually occurs, the head of the foetus in its passage through the pelvis exerts great pressure on the pelvic contents, as is shown by the occurrence of retention of urine caused by the pressure of the urethra against the pelvic arch, and also by the sloughing of the vaginal walls, which leads to the formation of fistulous communications with the bladder and rectum.

We must next notice the important part pressure plays in the production of eclampsia. All observers are agreed that eclampsia is very common in cases where the foetal head is large or the pelvis contracted, in twin pregnancies and in primiparæ. In fact, Lantos<sup>7</sup> found that 78 per cent. of his cases of eclampsia were primiparæ. In J. G. Swayne's practice<sup>8</sup> the percentage was 66 and at Guy's Hospital 60. Observers agree that the reason for the frequency amongst primiparæ is the greater tension of the abdominal muscles and therefore greater pressure on the abdominal viscera. For the same reason the subjects are often strong, robust, young adults. In a discussion at the Obstetrical Society of London in 1887 Herman said he did not think increased pressure was the sole cause, but believed it was one of the causal conditions, and that this view was supported by the rapid diminution in the quantity of albumen in the urine which always follows delivery. In cases where the foetal head is large or the pelvis contracted labour is prolonged and the ureters are more exposed to prolonged pressure and severe bruising. In cases of twins the exciting cause is not merely the great size of the uterus, for in hydramnios eclampsia is not unusually frequent. This may be due to the greater pressure of the foetal parts in cases of twins and also to the maternal kidneys having to get rid of the urinary products of the two foetuses. In cases of hydramnios we must remember that the hydramnios itself may be due to a deficient absorption of the liquor amnii, which is largely composed of foetal urine. Large ovarian cysts would resemble cases of hydramnios which are not prone to eclampsia. The cases of eclampsia occurring after delivery are usually very slight and pass off speedily. They are difficult to account for mechanically, unless we can suppose that the ureters are bruised during labour and become temporarily blocked. Let us next consider the premonitory symptoms of eclampsia and compare them with the symptoms of hydro-nephrosis. Spiegelberg says: "They consist mainly in sensory and gastric disorders and œdema of the face and limbs; headache, vertigo, depression, ill-humour, amblyopia or true amaurosis, dyspepsia, nausea and vomiting."

With these let us compare the symptoms of hydro-nephrosis, permanent or temporary, as given by Morris and Newman. Morris mentions "dry shaggy skin, nausea, vomiting, constipation, convulsions, febrile symptoms and coma"; and Newman, "severe pain in the renal region, sickness, nausea and vomiting, dimness of sight, severe and persistent headache and lethargy, with or without paroxysms of excitement. With regard to œdema, Spiegelberg<sup>9</sup> says it is an especially suspicious symptom when it affects the hands and face. Frequently it is only transitory, appearing in the morning after the woman has been lying, and disappearing in the course of the day. The cause lies in the alteration of the pressure relations by posture. The explanation of this is that in the recumbent position the gravid uterus presses on the ureters and iliac vessels, but in the upright position the weight is thrown more forward.

As we have seen above, according to Playfair general

œdema may be caused by pressure of the retroflexed gravid uterus on the urethra. If obstruction to the urethra can produce it, why not obstruction to the ureters? The œdema is doubtless due to the deficient excretion of urine. If we inquire what is the mechanical effect of pressure on the ureters, we find that several experiments have been made with a view to showing what happens when a ureter is suddenly or gradually blocked, so that the pressure in the pelvis and ureter becomes equal to that in the renal bloodvessels. Fagge,<sup>11</sup> quoting Herman, showed that in dogs the secretion of urine ceased to appear entirely under a pressure of 2.4 in. of mercury, and that when pressure is removed a large quantity of watery urine is poured out in which a very little urea is present. He also states that in obstructive suppression there is no anasarca, which does not agree with Playfair's observation that retroversion of the gravid uterus by pressing on the urethra may cause general œdema. He also mentions a case in which a young man, after five days' suppression, voided a large quantity of albuminous urine; this passing of albuminous urine after relief of pressure may explain some cases of albuminuria appearing after delivery and after eclampsia. He also says that "most observers now think that the cessation of the activity of the kidney as soon as the pressure in the ureter and renal pelvis reaches a certain point is apparent rather than real, the urine being really secreted but reabsorbed as fast as it is formed. In support of this I find an experiment of Bennett May's<sup>12</sup> in which water injected into the ureter with a little force passed through the kidney into the renal vein. Bennett May, in the same paper, quotes an opinion of Russell,<sup>13</sup> to the effect that "the secretion of urine ceased as soon as pressure was equalised," and another of Alexander James, who said "the secretion pressure of the urine is not sufficient to cause any marked dilatation of the ureter in case of sudden complete obstruction, but is so where the obstruction is partial or gradual." Newman<sup>14</sup> made an experiment to show how far the rapidity of the circulation through the kidney depended on the tension of fluid in the uriniferous tubules. The conclusion he arrived at was "that when the tension of fluid in the tubuli uriniferi increases the amount of urine secreted diminishes, and when it becomes equal to the arterial tension the secretion ceases, and the circulation through the Malpighian body may be stopped altogether by collapse of the arterial coil when the pressure outside is greater than that inside the vessel. This explains how by damming up the urine atrophy of the substance of the kidney may be produced as a result of insufficient blood-supply, seeing that most of the cortex is nourished by capillaries arising from the efferent vessels of the glomeruli."

These experiments and conclusions would suggest (1) that the gradual pressure of the pregnant uterus on the ureters may produce a gradual dilatation of the ureters and pelvis of the kidneys; (2) that the pressure of the pregnant uterus during labour on the ureters may completely arrest the secretion of urine (or if the urine is secreted it is again absorbed by the kidney), and this pressure would not produce any dilatation of the pelvis of the kidney or uterus or marked naked-eye change in the kidneys themselves; (3) that the œdema of the cortical portion of the kidneys found post mortem by Spiegelberg and Boxall in women dying of eclampsia may be caused by the pressure of the urine in the uriniferous tubules, as explained by Newman's experiment; (4) that albuminuria may follow when pressure on the urinary passages is relieved, as happens in delivery.

We must now turn our attention to the urine. Spiegelberg<sup>15</sup> says: "Except in rare cases it is highly albuminous, contains an abundance of renal epithelium, frequently the so-called fibrin casts and not uncommonly blood. In several patients the proportion of urea has been found to be remarkably diminished. Further, in all serious cases the amount of urine is very small, and then the secretion is always dark, contains much albumen, epithelium and numerous casts, sometimes blood cells. On the other hand, the bladder may be quite empty for hours at a time; there may be complete anuria." Compare this with the urine in hydro-nephrosis, in which affection, according to Morris, total, partial or intermittent

anuria may exist, and the urine may contain albumen, blood, pus, epithelial cells and casts, and be deficient in urea.

With regard to albumen it may or may not be present. Eclampsia may occur without albuminuria. According to Spiegelberg<sup>16</sup> such cases are very rare. He says: "Renal incompetency may develop very rapidly, and the urine would of course be previously quite free from albumen. If it gradually becomes albuminous it is hardly enough to prove that the albumen is the result of the convulsions; it is much more likely the result of the interruption of the renal circulation—a result of the alteration in the bloodvessels." Is it not possible that this alteration in the circulation may be produced by distension of the uriniferous tubules? Newman's experiment proved that distension of the tubules caused anæmia of the glomeruli and collapse of the coils of bloodvessels in them. The albuminuria may also follow the removal of obstruction, as in the case quoted by Fagge. In the discussion on eclampsia at the Obstetrical Society in 1887 Cleveland expressed the opinion that deficiency of excretion of urea was of much more importance than the presence of albumen. Further, some cases occur in which there is never a trace of albumen throughout. Spiegelberg relates such a case, and regards it as one of eclamptiform convulsions due to reflex irritation in the case of the bladder. I quote it in full because I think it is the best proof possible that eclampsia can be caused by obstruction to the outflow of urine from pressure. "The parturient woman was at full term and a primipara. She was seized with the first paroxysm twelve hours after the somewhat premature discharge of the liquor amnii, the second occurred soon after the arrival of the medical attendant. Owing to the head lying low down in the pelvis and to its compressing the urethra, he was unable to evacuate the greatly distended bladder, but extracted the head with the forceps. The accumulated urine immediately gushed forth (a sufficient quantity was drawn off with the catheter) and proved to be entirely free from albumen. The child lived. There was no return of the paroxysms, and the lying-in woman rapidly recovered."

There are many evidences of the pressure of the gravid uterus on the pelvic organs as it enlarges. The bladder is more irritable, the desire for its evacuation far more frequent and its capacity diminished. The anterior vaginal wall may be drawn up by the uterus and drag on the neck of the bladder. In the later weeks retention of urine may be due to the presenting part of the child pressing the neck of the bladder against the symphysis. Pressure on the large nerve trunks and plexuses causes cramps. Pressure on the iliac vessels causes œdema and varices of the thighs, buttocks, rectum and generative organs, and when we consider the relation of the ureters to the common iliac vessels we can easily understand how they can be compressed at the same time. What evidence can we gather from post-mortem appearances? Spiegelberg says: "There is a moderate degree of renal mischief and even the kidneys may appear to be healthy, with the exception of insignificant changes"; and in another place, "the kidneys are usually pale and bloodless." Galabin<sup>17</sup> says: "The changes in the kidneys may be slight and hardly discoverable, but if they recur in repeated pregnancies they may lead to chronic Bright's disease of the granular variety. The changes which have produced granular kidney may have begun as the epithelial or tubular form of nephritis." Boxall<sup>18</sup> says: "In fatal cases the cortical portion of the kidney was pale and anæmic and the pyramids congested." Herman says: "The post-mortem changes were of the most various kinds—viz., acute nephritis, large white kidney, granular kidney, dilatation of ureters and pelvis and no naked-eye appearance of kidney disease." We see from these descriptions that Spiegelberg and Boxall agree as to anæmia of the cortex being found as a rule. This can be explained by Newman's experiment as being due to pressure on the glomeruli of urine dammed up in the uriniferous tubules. Cases of chronic Bright's disease, of course, are predisposed to eclampsia, as the kidneys already are defective in eliminating the urinary poisons. Dilatation of the ureters and pelvis (Herman) must be caused by obstruction to the outflow of urine, as also may be granular kidneys. Lastly, with regard to treatment, if pressure on the ureters is an important and frequent cause of eclampsia, relief will follow its removal; and this is so, for the fits always quickly cease and albumen disappears after delivery. Also, if the patient is placed in the prone position the weight of the uterus is

taken off the ureters, and this we find has been recommended by Routh.<sup>19</sup> In a case in which he adopted it convulsions at once ceased, owing to pressure being removed from the kidneys. Graily Hewitt, too,<sup>20</sup> "had observed good results from placing the patient so as to take off the pressure of the uterus from the spinal region."

The conclusions arrived at are: 1. Eclampsia is due to retention in the blood of all the substances which should be excreted by the kidneys. 2. This retention may be due to obstruction to the outflow of urine. 3. Eclampsia in the early months of pregnancy may be caused by retroversion of the gravid uterus causing obstruction to the outflow of urine by pressing on the urethra, or by retroflexion of the uterus causing kinking of the ureters. 4. Eclampsia during the later months can be caused by pressure of the gravid uterus on the ureters at the pelvic brim. 5. Eclampsia during labour can be caused by pressure of the foetal head on the ureters and on the urethra. This is especially likely to happen (a) in primiparæ, (b) in cases of twins, (c) in cases of contracted pelvis and (d) when the foetal head is large. 6. There is an additional factor besides pressure, which is the urine secreted by the fœtus, which, passing into the maternal circulation, throws an increased amount of work on the kidneys.

Bedford.

### ENTERIC FEVER; LEFT HEMIPLEGIA; RECOVERY.

By G. P. NEWBOLT, F.R.C.S.ENG.

THE following case may, I think, prove interesting to the readers of THE LANCET, a similar case having been recorded on April 23rd, 1892.

A. M.—, aged twenty-one, fireman on a locomotive, came to my surgery on Sept. 30th, 1891, complaining of severe headache, vomiting and malaise. I ordered him to bed, and saw him again on Oct. 2nd. I then suspected enteric fever, and had him removed to the hospital at Ellesmere Port. He was a weakly-looking man of small stature, and never had suffered from any severe illness. His temperature at noon was 103°; pulse 100; skin dry and hot; bowels relaxed, the motion being fetid and of a pea-soup nature; abdomen full, but not tender; tongue foul and covered with white fur; heart sounds normal. He had been ill for ten days altogether. His pulse being soft and easily compressible, he was put on half an ounce of whisky every four hours.—Oct. 6th: Spots came out, and were well marked over the abdomen.—8th: The patient has a troublesome cough, and there is some congestion of both lungs at their bases. Bowels very loose; sordes on teeth and lips; expression of patient rather anxious. Spleen can be made out. Respiration 24; pulse 120; temperature 105.2° last night. No pain on pressure in abdomen. From this date until Oct. 19th he did well, his temperature on the morning of that day having dropped to 99°. The patient took his nourishment well, and his bowels were not so relaxed. He then relapsed.—23rd: Not so well. Diarrhoea more troublesome again, and temperature rising steadily.—26th: Evening temperature 105.5°, pulse 120. Bowels very loose; he was much exhausted. The whisky was increased to half an ounce every two hours.—Nov. 3rd: During the last week the temperature has never fallen below 101°. Bowels not quite so loose. He takes nourishment fairly well. Pulse very soft and dicrotic. He does not cough much; has slight frothy expectoration; the spleen is felt under the border of the ribs.—6th: Very little change. The temperature keeps up, and the patient is very low and delirious; he hardly recognises anyone, and passes his motions and urine under him.—8th: He seems almost moribund, but swallows fairly well; diarrhoea less. Is put on half an ounce of whisky every hour; beef-tea and milk *ad lib.*—10th: On visiting him I found that there was loss of power in the left arm and leg. He cannot speak plainly, and does not protrude his tongue quite straight; the right eyelid drops and he does not swallow so well. He seems to know when spoken to. Temperature at 6 A.M. was 98.6°; at 6 P.M. it was 102°.—11th: A slight fall in the temperature. The patient is in much the same condition and can just manage to swallow.—13th: Slight hæmorrhage from the bowels; given an enema of

turpentine and opium.—16th: There have been several small hæmorrhages. Temperature is lower and the patient swallows better and is more conscious.—17th: Temperature is from normal to subnormal; the patient is very collapsed, but is improving and takes his nourishment better; pulse 120; tongue cleaner; diarrhoea less; is very delicious at night. Takes egg and milk and half an ounce of whisky every three hours.—23rd: Left arm quite useless; no grasp; leg cold and immobile; protrudes tongue to the left; cannot whistle or close right eye completely; mouth remains partially open; can articulate and is much more sensible. There is loss of sensation in arm and leg.—30th: Power returning in leg, and he complains of pain in the limb; he can flex the limb and thus raise the knee from the bed. The arm is still almost useless.—Dec. 4th: He is steadily improving. Paralysis is disappearing. Is allowed some solid food. There has been no diarrhoea for a fortnight and no rise of temperature.—10th: Was allowed to leave the hospital. Can get along with crutches for a short distance, but is still very peculiar in his manner and restless at night.—Jan. 28th, 1892: Looks very well and is getting fat. Paralysis disappearing.—Feb. 15th: Can whistle and close the eye and mouth almost perfectly. The grasp of the left hand is not very good, but the arm has not wasted. Sensation is perfect. The peroneal muscles of the leg are wasted and painful, giving rise to a slight amount of talipes varus, which makes him walk in an awkward fashion, and he drags the leg.—22nd: He started work, and says he feels perfectly well. The leg is in much the same condition. There is still much loss of power in the arm.

I imagine the cause of the hemiplegia in this case to be due either to blocking of one of the cerebral arteries with a portion of a clot from the heart, due to the low condition into which the patient had passed, or by thrombosis *in situ*. I never for a moment expected the man to recover. The case was one in an epidemic occurring in this district during the autumn of 1891.

Ellesmere Port, near Chester.

### REMARKS ON BURNS AND SCALDS.

By FRANK GRANGE, M.D.LOND., D.P.H.CAMB., M.R.C.S.,  
LATE ONE OF THE HOUSE SURGEONS TO THE BLACKBURN AND  
EAST LANCASHIRE INFIRMARY.

I HAVE to thank the surgical staff of the Blackburn Infirmary for the use of cases having reference to the above subject.

Apart from special occupations the season of the year for burns appears to be on the wane,<sup>1</sup> for of 120 in-patient cases 62 per cent., and of a still larger number of slight burns two-thirds, were found to occur in the six winter months. At the above institution, with an average of about 8 fatal cases yearly, four inquests on burns were held between Christmas Day and the end of January last, all of which were unconnected with special "employment" and three of them were "fireplace" accidents. Thus one man gave a history of alcoholic sleep over the fire as the cause. This connexion of burns with the "winter fireside" is made more prominent when these are contrasted with "scalds," for of 80 of the latter an equal number occurred in the summer and winter months, a reference to the uniform demand of the culinary art throughout the year being an obvious explanation. Out of 146 unselected cases of slight and severe burns and scalds (over ten years of age) there were nearly twice as many males as females. This is due to the fact that "occupation"—e.g., "mining"—accidents are included, the severe cases being proportionately more common in males. Out of 32 deaths, 12, or more than one-third, were under six years of age, and 8, or about one-fourth, were between six and twenty-one years of age, more than a third being after the twenty-first year ("occupation" burns not being excluded). Of 34 deaths, 10, or not quite a third, occurred in the first twenty-four hours after the accident; one-half of these were under the age of five years, the remaining accidents being exceptionally severe; 16, or not quite half of these cases, died within forty-eight hours; 10, or not a third, died between the second and fourteenth day. One patient died on the eightieth day. It is an important point that in cases fatal between the second and fourteenth day, while in adults and older children pulmonary symptoms and post-mortem

<sup>19</sup> *Ibid.*, vol. i. 1886, p. 400.

<sup>20</sup> *Ibid.*, vol. ii. 1886, p. 1355.

<sup>1</sup> This was written in March.

signs are as a rule prominent, in younger children nervous symptoms, such as delirium, convulsions, and in a boy of five years tetanus, are common and have sometimes correspondingly suggestive post-mortem signs. For instance, in 2 recent fatal cases with cerebral symptoms a yellowish-grey fibrinous (?) ante-mortem clot occupied the longitudinal sinus at the necropsy. The great prognostic import of extent of surface involved, pre-eminently in young people, has long been insisted on. A writer in the "International Encyclopædia of Surgery" allows that "if one-half or even one-third of the surface has been burned or scalded death is inevitable." Mr. Bryant says: "When more than half the surface of the body is injured a fatal result generally takes place, and in the young and old all burns and scalds of any extent are serious." By carefully dividing the surface of the body as nearly as possible into proportional fractional parts and then by calculation from measurement and visual judgment of recent cases of burn or scald post mortem an approximate result of some prognostic value should be obtained.

I beg to acknowledge the critical judgment of the senior house surgeon, Dr. Wheatley, and a few professional friends in suggesting the following as a rough estimate only of the proportionate surface areas of the body. Taking the arms as together equal to 2, we have: Arms = 2; legs =  $\frac{3}{2}$ ; trunk =  $\frac{7}{4}$ ; head and neck = 1. I have applied the above method and figures to four recent cases of deaths from burns.

The first case, a well-nourished boy of two years, was admitted on Dec. 22nd last, with burn from the first to fourth degrees of the following approximate extent: Half of left abdomen to angles of ribs and loins; half of left leg and less than one-fourth of both arms. From these proportions it may be calculated that not one-seventh part of the surface was involved, and yet the boy died in sixteen hours after the accident, notwithstanding stimulant treatment. It should be mentioned, however, that the effect of a warm bath was probably injurious.

In the second case, a healthy boy of eight years was burnt by a coal falling from the fire. Approximately one-fourth (upper part) of both legs, one-eighth of right arm, three-eighths of the whole trunk from the first to fourth degrees, and the genitals were involved. A convulsion of the face and arm, unconsciousness and pyrexia to 102.5° occurred on the second day, and he died on the fourth day. The necropsy showed a fibrinous, presumably ante-mortem, clot in the longitudinal sinus. It may be calculated from the above that less than one-fourth of the surface of the body was here involved.

The third case was that of a healthy child of about five years, admitted on Jan. 17th with about a quarter of the right abdominal surface and two-thirds of the right thorax, with corresponding back and rather more than half of the right upper extremity involved. There was also a slight burn over the right ear and corresponding part of the face. Death occurred on Jan. 18th. It may be calculated that probably not more than one-fourth of the entire surface of the body was involved.

The fourth case was that of a man aged twenty-four years, whose left hand and forearm were burned to the fifth degree, the upper arm and two-thirds of left side of thorax to the third and fourth degrees, while the right arm had a slight burn on it when admitted. This patient died in the fourth week after the accident. Disintegration of the stomach was found at the post-mortem examination, but no duodenal ulcer. In this case we may compute that probably not one-sixth of the surface of the body was involved.

From the foregoing remarks the following conclusions are suggested:—1. That burns to the third and fourth degrees are frequently fatal when not a fourth of the entire surface is involved. They are probably often fatal in young children when not a seventh of the entire surface is affected. 2. That since "shock" appears to be such an important factor in these results—even when death occurs after the second day—the "warm bath" treatment recommended by authorities is in the case of those unused to baths distinctly contra-indicated during the first forty-eight hours as tending to increase the shock. This applies especially to children. 3. That the great proportionate fatality in children may be partly explained by the fact that in them the shock to the nervous system falling largely on the medullary and emotional centres expends itself on parts essentially organic and of vital importance, which parts are in no way reinforced, as in adult life, by the later, yet less vital (?) cortical controlling centres.

Southampton.

## HEPATIC ABSCESS.

By G. HARRISON YOUNGE, F.R.C.S.I.,  
SURGEON-CAPTAIN, ARMY MEDICAL STAFF.

IN THE LANCET of July 25th, 1891, under the above title, there is an article by Surgeon-Captain W. A. Morris, in which he dissents from the now universally accepted rule that we should treat abscesses of the liver on exactly the same lines as we treat collections of pus in any other organ or tissue of the body. It is to be regretted that Surgeon-Captain Morris did not state more fully his reasons for objecting to what is now an established rule of surgery. No one who has a practical knowledge of hepatic abscess will dispute his statement that "it is by no means easy, except in very few cases, to absolutely detect the presence of liver abscess, much less its locality." Difficulty in detecting any given disease is not, however, a valid reason for declining to operate when it has been recognised. Experience in India has taught me that almost the only chance of saving the life of a patient who is suffering from an abscess of the liver lies in opening the abscess freely, and draining it thoroughly. The arguments in favour of this line of treatment are overwhelming. When pus has once formed in the liver it increases, at least in India, with startling rapidity. An abscess which contains but an ounce or two of pus may in a fortnight involve almost the entire liver. By operating early we prevent such an untoward result; while, at the same time, we operate on tissues that have not been undermined, and before the constitution has been damaged by septic absorption. If the operation is deferred until fluctuation becomes evident, and the constitutional symptoms well-marked, a large amount of the liver substance will be destroyed, and this must of necessity prolong the process of cicatrization, even if does not render recovery impossible. Delay in operating also exposes the patient to the risks of hectic fever and perhaps pyæmia. If an expectant plan of treatment is adopted the abscess may burst into the pericardium or peritoneum, either of which events would be immediately fatal. Even when an abscess is discharged through the lung, which was formerly regarded as the most favourable route for its evacuation, recovery only takes place after prolonged suppuration and considerable destruction of the lung tissue, which will leave the patient's constitution more or less damaged for life.

While stationed in India I invariably adopted the following line of treatment and can most strongly recommend it. As soon as an abscess was suspected the patient was at once placed under chloroform and the liver explored with the smallest sized needle of an aspirator. Before being used the needle was always allowed to stand for some time in strong carbolic lotion. A small puncture having been made through the skin with a bistoury over the suspected site of the abscess, the index finger of the right hand was placed over the thick end of the needle, and it was taken up in such a way that it remained full of carbolic lotion. The needle was then passed into the liver through the puncture made with the bistoury. If pus was not detected the needle was withdrawn and inserted in another situation. The liver was thus carefully explored in different directions until either an abscess was detected or until it was evident that such did not exist. If pus was found the exploring needle was at once withdrawn and an incision made along its track down to the liver. A bistoury was passed along the track of the needle until it entered the cavity of the abscess. The bistoury was then withdrawn and the opening enlarged to about an inch by Hilton's method, so as to avoid all danger of hæmorrhage. When the dressing forceps were withdrawn a drainage-tube was inserted and the abscess cavity syringed out with carbolic lotion (1 in 50). The greatest care was of course always taken in dressing the operation wounds, so as to keep them thoroughly aseptic. While any discharge continued the abscess cavity was syringed out at least twice daily and the drainage-tube was never removed until all discharge had ceased for some days, as otherwise it was found that the abscess was certain to refill.

When an abscess can be opened posteriorly a single opening is usually all that is required. When, however, it has to be opened anteriorly perfect drainage is impossible through a single opening. If such only is made pus is certain to accumulate in the abscess cavity, and to cause hectic fever

and perhaps pyæmia. In these cases the only hope for the patient is to make a counter-opening at the most dependent part of the abscess. The drainage-tube should be passed into the abscess cavity through the upper opening and then brought down through the lower one. There is scarcely an operation in surgery which gives greater or more immediate relief than that of freely opening and fully draining an abscess of the liver. Indeed, in an acute hepatic abscess an early operation is almost as urgently required as it is in a case of strangulated hernia. In a chronic abscess the necessity for an early operation is not so urgent, but even here success depends mainly on early and free drainage. Few surgeons would suggest that an abscess of the knee, for instance, should be allowed to remain unopened until the structures composing the joint are disorganised. Then why recommend this method of dealing with an abscess of the liver?

Station Hospital, Colchester.

### A CASE OF APPARENT DOUBLE LABYRINTHINE DEAFNESS,

WITH AN INTERVAL OF THREE MONTHS BETWEEN  
THE ATTACKS; NO EVIDENT CAUSE.

By T. REUEL ATKINSON, M.R.C.S. &c.

THE patient in this case is myself. My age is thirty-five; family history good; parents both alive, each aged seventy-five; no previous illness since infancy except bilious attacks; have never had syphilis. About the second week of December last I noticed a singing noise in the right ear, and, after a few days, in addition observed vertigo and an uncertainty of gait, so that I had at times a difficulty in keeping on the pavement. I also feared Ménière's symptoms. About this time, too, certain dull pains at the back of my head supervened, which I judged to be rheumatic, having had similar pains from time to time for the last three or four years, and due, as I thought, to the effect of the rain beating under my hat when driving. For this I took five grains of quinine three times a day for about a week, after which the pain, vertigo and tinnitus all left me. About a week afterwards, on the morning of Dec. 27th, I got out of bed apparently quite well, and had shaved, and washed myself down to the waist, and was briskly rubbing myself dry with a rough towel when suddenly I became very giddy, was instantly sick, and a violent singing started in my right ear. I at once lay down on the bed and soon after noticed that I was deaf on the right side. I have never had any trouble with my ears before, no earache or catarrh or discharge of any sort. I stayed in bed a week, during which time the nausea and giddiness passed off, but the deafness and tinnitus remained, and continued for the next three months with but little, if any, improvement. I was able to get about and do my work fairly well, but was obliged of course to give up the use of the binaural stethoscope. One morning about three weeks after the attack I awoke to find I saw "double," and there was a blurring of vision with diplopia all day, passing off again towards night. On no other occasion have I noticed any errors of vision. Towards the end of March I began to develop certain nervous symptoms. These consisted mostly of an indescribable feeling, apparently starting in the epigastrium and gradually spreading thence all over the body down to my finger tips, these latter occasionally becoming numb and feeling as if "asleep." At the same time there was often a feeling of chilliness with a slight increase of temperature, one night rising to 100.2°. These attacks came on several times a day and occasioned a mental impression as of "fear" and a depression of spirits, leading often to tears. Sometimes these attacks occurred as I was driving along country roads, the horribly curious sensations then running down to my toes. I have no words to express the feeling. I started on a course of strychnine, bark and nitrohydrochloric acid, and continued taking this with evident improvement till April 4th, when I walked five miles to see a patient and had not felt so well for months.

On the following morning, April 5th, another attack, almost identical to the one experienced on Dec. 27th,

took place. I had just returned from the bathroom after taking a tepid bath, and was commencing to dress, when suddenly, as before, giddiness came on; I vomited, a loud tinnitus started in my left ear and I found I was now deaf on both sides, but worse on the left. As before, the nausea and giddiness passed off with a few days' rest in bed. I at once commenced injections of pilocarpine, which I continued for the next three weeks, but with no benefit. I then went to London and consulted some of the leading members of the profession, but could not hear of a case exactly similar to mine, although one very like it had been published in THE LANCET some months previously by Dr. Ferris. In that case there was a specific history to fall back upon as a possible predisposing cause. I have been advised to try various methods of treatment and I have already given a trial to bromide of potassium, salicylate of soda, hydrobromic acid and blisters behind the ears, besides the pilocarpine. I am now trying iodide of sodium with liquor hydrargyri three times a day and bromide of potassium with compound spirit of ammonium. I am not able to suggest the slightest cause for the first attack. I have never had any special head injury beyond what might arise from an occasional fall from time to time whilst following the hounds. My habits are in all points strictly temperate. As a possible predisposing cause to the second attack there is the fact that my nervous system was from some obscure cause evidently disorganised. I suppose I may consider that on each occasion I have had an effusion into the internal ear.

I should feel extremely obliged to any medical man who may happen to have met with such a case in his practice if he will privately communicate with me on the subject. I should be particularly glad of any hints as to prognosis or treatment. Might influenza, not noticed and not treated and followed by more or less peripheral neuritis, account for these symptoms without any positive effusion into the labyrinth? My present condition is—Membrana tympani: fair. Eustachian tube: open to valsalva. Eyes: accommodation 10"; vision normal: ophthalmoscopically normal.

Sherborne, Dorset.

## Clinical Notes:

### MEDICAL, SURGICAL, OBSTETRICAL AND THERAPEUTICAL.

#### CASE OF INTUSSUSCEPTION; GANGRENE; DEATH.

By CECIL ROBERTSON, M.B., C.M. ABERD.

On Thursday, June 30th, 1892, I was called to see A. B—, a male infant aged six months. The child had always enjoyed very good health from its birth till about three weeks before I was called in, when it fell out of its perambulator, and since then, although not appearing to have received any injury, it seemed to suffer more or less abdominal pain. On Monday, June 27th, the child was seized with vomiting, accompanied by a good deal of paroxysmal pain in the abdomen and absolute constipation. This continued without intermission till I was called in on June 30th. The child was then very low; the pulse frequent, small and fluttering, the tongue dry and brown and the urine scanty and high coloured, while very fetid blood-stained mucus was being passed per rectum. On inspection the abdomen was found to be slightly distended and a sausage-shaped swelling could be felt to the right of and below the umbilicus. As the typhoid condition of the child and the passage of the blood and mucus seemed to point to gangrene of the inverted portion, it was decided not to open the abdomen or perform inflation. The child's strength was maintained by frequent small doses of strong beef-tea and brandy-and-milk. On Tuesday, July 5th, the child passed per anum a piece of intestine rather larger than a postage stamp, very discoloured and fetid. This was followed on the same day by four stools, and for the next ten days a motion was passed at least once a day and of firmish consistence, the general condition of the child improving meanwhile. The vomiting entirely ceased, the tongue became moist and clean and the child seemed likely to do well. On Saturday, the 16th, however, a change for the

worse occurred. The abdomen became enormously distended and coils of intestine could be seen through the abdominal walls. My partner, Mr. Dickinson, very kindly came and saw the case with me and we decided to puncture the intestine. Accordingly we selected the most resonant spots and introduced a large hypodermic needle, and were able to give vent to a large quantity of flatus, which greatly relieved the patient for the time being, but for the time being only. The punctures were repeated three or four times with varying success, the child gradually becoming weaker and weaker until it died on July 27th.

In my absence Mr. Dickinson made a post-mortem examination when the following condition of things was revealed. On opening the abdomen he found the small intestines enormously distended with flatus and containing a fair quantity of fluid faeces. The seat of the strangulation was easily detected. It was at the most usual point—the ileo-cæcal valve. About two inches of small intestine had passed into the cæcum, forming a tense sloughing mass which quite occluded the lumen of the large gut. Adhesions had formed between the peritoneal surfaces of the entering and returning layers. It was seen that no amount of traction or squeezing would reduce the inversion—at least, no amount that could have been used with safety during life.

*Remarks.*—This case is interesting, if only from the length of time the child lived from the time symptoms of gangrene set in—four weeks. The cessation of urgent symptoms and the subsequent occurrence of stools for ten days after the passing of such a small slough certainly led me to hope that recovery was likely to take place by natural means, rare as that is; but the supervention of peritonitis complicated matters so much and put such a severe strain on the child's already over-taxed vitality that it succumbed before the remaining slough had time to separate.

Southfields, S.W.

#### UNUSUAL OCCURRENCE IN LITHOTOMY.

By SURGEON-MAJOR D. CHARLES DAVIDSON,  
INDIAN MEDICAL SERVICE; CIVIL SURGEON, SATARA, INDIA.

ON Feb. 9th last a Hindoo (male) aged about twenty-three was admitted into the Civil Hospital, Satara, suffering from the usual symptoms of vesical calculus, and on the sound being used the ordinary evidence of stone in the bladder was elicited. The man stated that about four months previously a small twig had been inserted into his urethra and that in attempting its withdrawal it broke, and a portion still remained in the urethra. On Feb. 11th lateral lithotomy was performed by me and the foreign body removed from the bladder. What had given out the ordinary sound of a vesical calculus was found on examination to consist of seven inches and a half of a small twig about the thickness of a No. 5 catheter, doubled up several times and forming the centre of an elongated calculus, chiefly phosphatic. The patient made a good and uninterrupted recovery. The manner in which the foreign body had been introduced, or the reason for its insertion, could not be clearly elicited from the patient, and I had reason to doubt his statement regarding the length of time it had remained unremoved. Such cases are somewhat rare, this being the first of the kind met with by me in a large number of lithotomy cases.

**HERTS CONVALESCENT HOME.**—At the annual meeting of the friends of this institution, held last week at Elsenham Hall, Bishop Stortford, a favourable report was presented by the hon. secretary. During the past year 616 patients were admitted into the Home, showing an increase of 40 over the number receiving aid during the previous year. The income, including fees derived from patients, amounted to £2464.

**HOUSE SANITATION.**—At the Marylebone Police-court, a few days ago, the owner of a house in Dartmouth-park-road was charged before Mr. Hannay with allowing the premises to remain in an insanitary condition. The tenant had occupied the house since June last, and several of his family had suffered from ill-health owing, it was alleged, to defective drains. This condition was verified by tests applied by Dr. Sykes, the medical officer of health. The magistrate inflicted the penalty of £5, and required the defendant to proceed with the necessary repairs at once.

Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Proœmium.

#### KING'S COLLEGE HOSPITAL.

RETRO-PHARYNGEAL ABSCESS IN A CHILD; TRACHEOTOMY;  
INCISION; RECOVERY.

(Under the care of Mr. ALBERT CARLESS.)

THIS case serves to draw attention to the advantages of the incision first practised by Professor Chiene and brought by him before the annual meeting of the British Medical Association some two years ago. All surgeons are not agreed as to the advisability of employing this incision, for we read in Heath's Dictionary of Surgery:<sup>1</sup> "The simpler plan of opening it in the mouth has the advantage of easily allowing a sequestrum to be removed. The writer does not think the advantages of the external method commensurate with its difficulty of performance and more serious character." It is very difficult to satisfy oneself before opening as to the extent of these abscesses, especially when there is cervical caries, for they not infrequently extend into the posterior mediastinum, and we have published a case in which the cavity of the abscess extended down to the diaphragm.<sup>2</sup> To open these bone abscesses through the mouth increases the liability to a fatal result, if it does not directly induce it. We have also published notes of a case under the care of Mr. Gray,<sup>3</sup> in which a retro-pharyngeal abscess was complicated with and obscured by subacute laryngitis. Tracheotomy was performed for the relief of the latter before the former was discovered. In many cases the dyspnoea will probably be relieved when the abscess is opened, and no further laryngeal complications be met with. Mackenzie, however, describes a case in which secondary disease of the cricoid developed. These abscesses may require treatment at any age. Schuppert and Hambursin met with them in infants of three months old, and we have recently seen one opened by the method which Mr. Carless employed (only on the right side of the neck as first performed by Professor Chiene) in a man aged sixty-seven.

D. C—, aged one year and seven months, was admitted on July 18th, 1892, at 11.30 P.M., suffering from urgent dyspnoea. The history given was that the child had recently been an in-patient at another hospital for a bad cough, that it had only been discharged a few days, and the mother thought it had caught cold and assigned this as a cause for the present symptoms. There was also some discharge from the ears and a swelling had been noticed a few days previously just below the left ear. It was supposed that the dyspnoea was due to a blocking of the pharynx by much enlarged and inflamed tonsils; but the house surgeon, Mr. Ramsay, on looking at the throat, found a large median swelling completely blocking the fauces, and on examining this with the finger it was found that the posterior pharyngeal wall was bulged forwards by a soft elastic mass, evidently an abscess. Tracheotomy was at once performed to relieve the dyspnoea, the child, however, ceasing to breathe as the operation commenced. Artificial respiration was commenced as soon as the tube was in place and maintained for a few minutes, when the child breathed naturally and easily and the cyanosis disappeared.

July 19th.—Mr. Carless saw the child at 3.30 P.M. It was then breathing comfortably in a tent, the air of which was warmed and moistened by a steam kettle; the physical condition at the back of the pharynx remained unaltered. The abscess was opened under chloroform by Professor Chiene's method. An incision was made behind the left sternomastoid an inch and a half in length, extending downwards from a little below the apex of the mastoid process. Several enlarged glands presented and one or two were removed; the tissues were much matted together by inflammatory exuda-

<sup>1</sup> Vol. i., p. 346.

<sup>2</sup> Taylor: THE LANCET, vol. i. 1876, p. 74.

<sup>3</sup> THE LANCET, vol. ii. 1876, p. 46.

tion. The posterior border of the sterno-mastoid was carefully defined, and the muscle drawn forwards by a retractor until the transverse processes of the second and third cervical vertebræ could be distinguished. By palpation through the mouth the portion of the abscess most accessible from the wound was felt for, fluctuation being clearly obtained between the two hands. A pair of sinus forceps was now pushed through the deep fascia just in front of the transverse processes and directed behind the pharynx towards the abscess. By opening the forceps this puncture was enlarged sufficiently to allow the finger to be inserted, and by this means the abscess was opened, several drachms of creamy pus being evacuated. The anterior surfaces of the bodies of several cervical vertebræ could be distinguished, but there was no bare bone and no evidence of vertebral disease. A drainage-tube was inserted and the wound stitched up.

20th.—Wound dressed; looking very well; discharge merely serous and none to press out. The child cannot breathe comfortably without the tube, and the attempt to do so was accompanied with much laryngeal stridor.

23rd.—Wound redressed and drainage-tube removed; discharge merely serous and very slight. Tracheotomy tube also removed and respiration performed comfortably without it. Both wounds healed satisfactorily and quickly and the child was discharged quite well on Aug. 5th.

*Remarks by Mr. CARLESS.*—The treatment of retro-pharyngeal abscesses seems to be still in a somewhat unsatisfactory state, for even in text-books published in 1891 and supposed to be up to date elaborate instructions are given for dealing with them through the mouth, and scarcely any mention is made of the above plan of treatment. Speaking generally, abscesses placed behind the pharynx are divided into two clinical groups—the acute, arising from a traumatic cellulitis started by a penetrating wound of the pharyngeal wall, say, by a fishbone or from a sympathetic lymphadenitis, the retro-pharyngeal glands suppurating as a result of intranasal mischief, or idiopathically, the most common form in children and possibly due to suppuration within one of the pharyngeal follicles extending backwards; such abscesses are almost always treated by incision through the mouth. The second, or chronic retro-pharyngeal abscesses, are tuberculous and secondary to caries of the cervical spine. The majority of surgeons concur that the plan of treatment devised by Professor Chiene of Edinburgh should be adopted in these cases, and as to the wisdom of this course there can be no doubt; for to open such an abscess into a septic cavity like the pharynx is to expose patients to all the risks of chronic septic poisoning from which antiseptic surgery has claimed to deliver them. The above case is reported in detail in order to emphasise the fact that the same plan of treatment should be adopted, even in acute cases, where no spinal disease is present. The advantages claimed for it are: 1. That the patient runs no risk from the entrance of pus, often fetid, into the air passages. For even if the incision be made with the head hanging backwards over the end of a table, as recommended by some German surgeons, the first deep breath which follows the removal of the swelling which has caused the dyspnoea is likely to be accompanied by the entrance of more or less of the pus, and this may lead to all sorts of subsequent pulmonary trouble. 2. That the duration of the case will be much shorter and the after treatment much simpler. The external wound is readily kept aseptic, and thus when once the pus has been evacuated nothing but serum will subsequently escape, necessitating a drainage-tube to be inserted for a few days only. If the opening be made through the mouth suppuration continues until the cavity is completely closed, rendering needless the daily passage of a probe, sound or syringe to keep the pharyngeal wound from closing and thus prevent reaccumulation; and such is by no means easy in children. Moreover, the pus formed will be discharged into the pharynx and swallowed, and the general health thus further impaired. The operation itself is by no means difficult if care be taken to follow the guides given—viz., (a) the posterior border of the sterno-mastoid; and (b) the transverse processes of the vertebræ. The main vessels and nerves of the neck will not be seen and are in no danger, as the necessary manipulations can be performed well behind them. It may be objected that tracheotomy is rather a severe additional measure to adopt for the relief of the dyspnoea, but it must be remembered that this is due not merely to the mechanical obstruction caused by the abscess, but also to the œdematous condition of the glottis associated therewith, and which does not always

disappear immediately. In the above case respiration was not satisfactorily re-established without the tube for four days, and marked laryngeal stridor was present on any attempt to do without it during that period. I cannot but think that an aseptic high tracheotomy and an aseptic evacuation of the pus through the neck is much preferable to plunging a bistoury or pharyngotome through the pharyngeal wall, and that the convalescence will be shorter and more satisfactory.

### NORTH RIDING INFIRMARY, MIDDLESBROUGH.

A CASE OF URINARY CALCULUS, THE NUCLEUS BEING FORMED OF A LEAD PENCIL GUARD; LATERAL LITHOTOMY; RECOVERY.

(Under the care of Dr. WILLIAMS.)

WE give below an account of a calculus removed by the lateral cutting operation from the bladder of an adult male. The nucleus is of unusual character, and although many and very different substances have been introduced into the bladder, we are not acquainted with a nucleus quite of this description. The deposit upon this foreign body is deserving of attention; the usual deposit consists of the phosphate of lime and phosphate of magnesia and ammonia. In this case there were "a layer of uric acid, then fine alternating layers of uric acid and phosphates, and then a thick layer of phosphates." In the museum of the Royal College of Surgeons of England there is a specimen amongst the calculi described in the catalogue: "A slender piece of steel as the nucleus of a large oval calculus, consisting almost entirely of uric acid. The tendency to the deposit of uric acid must have been very strong in this individual, since it has not only prevented the deposition of phosphates, but has established and maintained during the whole of the period required for the growth of the calculus a diathesis of a totally different character." The patient under the care of Dr. Williams must have had this tendency very strongly marked.<sup>1</sup> For the notes of the case we are indebted to Mr. G. Victor Miller, resident surgeon.

T. W.—, aged thirty-six, of no occupation (being a man of weak intellect), was admitted into the North Riding Infirmary on April 6th, 1892, complaining of frequency of micturition, together with great straining and pain in the supra-public region and in the urethra when passing urine. He stated that he passed his urine every twenty or thirty minutes, and that the bowel came down during the act. This condition had been going on for two months. As there was evidently obstruction to the proper outflow of urine a catheter was passed, which on entering the bladder was found to grate against something which proved to be a stone when a sound was introduced. The stone lay towards the pubes just to the left of the urethra and appeared to be fixed, for each time an instrument was introduced (and this was pretty frequent, either for washing out the bladder or for examination) it always came in contact with the stone lying in the same position. On informing the patient's mother that he was suffering from stone, she said that he had been brought to this infirmary three years ago to have a hairpin which he had inserted removed from his urethra, and possibly he may have passed something up again. He was questioned, and it was ascertained that he had, two years ago, passed up a piece of tin about a quarter of an inch wide and an inch long; he said it had remained up and did not trouble him in any way. The urine on admission was alkaline and after standing deposited a dense layer of phosphates and pus. The capacity of the bladder, as was ascertained on washing it out, was greatly diminished—a condition due, of course, to inflammatory changes caused by the presence of a foreign body. The diagnosis was stone in the bladder, with probably a foreign body as a nucleus.

Having received permission to operate, it was decided to perform lateral lithotomy. Lithotripsy was considered inadvisable owing to the probable presence of a foreign body. The operation was performed on April 26th. No difficulty was experienced in effecting an entrance into the bladder, but trouble began on introducing the forceps. Examination with the finger showed the stone to be fixed towards the pubes in a sort of pouch of the bladder wall. The long axis of the stone was lying transversely, rendering it difficult to seize

<sup>1</sup> See also THE LANCET, vol. i. 1880, p. 1248.

it with the forceps. At the first few attempts to grasp the stone the outer layers of it, consisting of phosphates, came away. Finally, after a series of attempts, the whole was removed by the finger and scoop aided by supra-public pressure. After this the pouch was cleared of a quantity of phosphatic debris and the bladder, freely washed with boric lotion. The stone, without including the shell first broken off, was almond-shaped, being an inch and a quarter long, three-quarters of an inch wide, and half an inch thick. One side of it having been scraped away with a pen-knife, there was disclosed lying along its centre a brass guard for a lead pencil. Round the foreign body was a layer of uric acid, then fine alternating layers of uric acid and phosphates, and outside these a thick layer of phosphates. The specimen may be said to be unique. The whole stone, including the layers that were broken off, would be about the size of a large walnut. The patient made good progress until May 5th, nine days after the operation, when his temperature suddenly rose to 105° F.; he complained of headache and a feeling of sickness; his tongue was very foul and he had several slight rigors. This condition was combated by antifebrin, free washing out of the bladder with weak boric lotion and by purgation. Next morning the temperature had fallen to 99°, and from this time his progress may be said to have been uninterrupted. Simultaneously with the closing up of the wound the patient began to retain his urine for an hour or two, and as the condition of the bladder improved so did its capacity become greater and the urine could be retained for several hours. The patient's general condition improved. His appetite increased and he gained in weight. He left the hospital perfectly recovered on June 17th.

#### DEVON AND EXETER HOSPITAL.

COMPOUND DEPRESSED FRACTURE OF SKULL; LACERATION OF BRAIN; OPERATION; RECOVERY.

(Under the care of Mr. BELL.)

THIS is another interesting contribution to the surgery of the brain, and is the more interesting from the fact that several hours elapsed between the injury and its treatment. The brain was extensively damaged in the motor area on the left side and the symptoms indicative of injury in that region chiefly showed themselves during the time when oedema of the brain might be expected. We published last year<sup>1</sup> notes of a case in which after a fall a boy four years old developed symptoms on the same side as the injury, and recovered after the depressed fragments had been elevated. We also published in July of that year two interesting cases operated on by Mr. Hulke for compound depressed and comminuted fractures. We are indebted for the notes of the case to Mr. H. Andrew, house surgeon.

A. P.—, aged twenty-four, was admitted on April 15th, 1892. On admission he was able to walk in, was a well-made youth, rather pale, but quite conscious. He had a slight fault in his speech, and was at a loss for words now and then—a condition which had only come on since the accident. He complained that while driving a young horse on the previous day, he being seated on the shafts of the cart (left side), he was thrown off and fell into a ditch, where he was picked up shortly afterwards unconscious, in which state he remained for three hours. A medical man was called in, who said his skull was fractured. He advised the friends to bring him to the hospital, which they did the next day, a distance of ten miles. Previously to the accident he had had a little drink, but was sure he was not drunk.

On examination, just below the left parietal eminence was a small contused wound about an inch in length, something like an inverted 'I'; the probe passed in for more than an inch, but nothing was detected, so it was withdrawn and tilted, when a rough edge of bone was felt. There was marked pulsation around the wound; pupils equal; no paralysis to be made out; heart and temperature normal. Shortly after admission chloroform was administered and Mr. Bell prolonged the posterior limb of the wound, and on reflecting the flaps found that several large fragments of bone were buried in the brain. He trephined over the parietal eminence and removed six large pieces. They were placed so as to form a cone rather over an inch in depth. A considerable portion of

cerebral matter escaped during the operation, and while the fragments were being removed there was marked twitching of the muscles of the right side of the face and the right hand. The wound was thoroughly irrigated and sewn up, a space being left for drainage.

April 20th.—During the night the patient complained of numbness of the right hand and arm, as also of increased inability of expressing himself. At 12 (noon) there were slight convulsive movements of the right side of the face and arm, with loss of consciousness for about two minutes. At 11.30 P.M. there were very marked convulsive movements of the right side, face, arm and leg, and he bit his tongue. A dose of bromide of potassium was ordered every four hours.

21st.—Paralysis of the lower half of the right side of the face, with marked weakness of the right arm.

From this time he rapidly improved, and when last seen on July 18th there was complete recovery from the paralysis and but slight difficulty of speech. He feels well and clearly remembers events in connexion with the accident.

The temperature rose after the operation to 100°, and for the next ten days ranged from 98.6° to 99.8°; it then became slightly subnormal. The pulse during the first four days ranged between 70 and 80; the next week it gradually fell to 40, and remained thereabouts for a fortnight. The respiration continued throughout the first weeks at from 24 to 20.

### Reviews and Notices of Books.

*Practical Pathology: a Manual for Students and Practitioners.* By G. SIMS WOODHEAD, M.D., F.R.C.P. Edin. Third Edition. Edinburgh and London: Young J. Pentland. 1892.

THERE is no better index of the progress of science than that which is afforded by the successive editions of a standard text-book. The author of such a work, if he wishes his book to maintain its popularity, is compelled to keep pace with advancing knowledge and must perforce enlarge the limits of his manual. To do this well requires much skill and judgment as well as an intimate acquaintance with the growing literature of his subject and a practical familiarity with modern methods. Those who remember the advent of Dr. Woodhead's manual nine years ago and the freshness with which the details of morbid histology were described and illustrated will find in the latest edition a considerable amplification and revision of the text, as well as many new coloured engravings which form a notable feature of the book. Thus the work has much increased in bulk without losing any of its characteristic points. In the first place the author has made many additions to the technical part dealing with methods of preparation of histological specimens, showing how well he has kept abreast of the times. In the chapter on Inflammation and Repair we find much that is new, and the share taken by the connective-tissue elements in the latter process is clearly enforced; whilst naturally the doctrine of phagocytosis receives prominent notice. As regards the organs, which are dealt with in turn, the descriptions of their morbid lesions are preceded by a brief exposition of normal structure; we may notice a particularly full account of acute interstitial hepatitis, as occurring in the course of scarlet fever; an able comparison of the histological features of common cirrhosis and biliary cirrhosis; the process of fatty degeneration of the heart wall in pernicious anæmia and that of the kidney in diabetes; whilst the student can have no safer guide in the interpretation of phthisical lesions than is given in the pages devoted to tuberculosis of the lung, caseous broncho-pneumonia and phthisis. The sections upon the bones and joints and that on the nervous system have also received considerable additions. In a word, the book cannot fail to be of the greatest service to the worker in the pathological laboratory and Dr. Woodhead may be congratulated upon the success with which he has managed to render it one of the most useful and practical manuals of its kind.

<sup>1</sup> THE LANCET, Oct. 10th.

*The Scottish Poor-laws: their History, Policy and Operation.*

By ROBERT PEEL LAMOND, Member of the Faculty of Procurators in Glasgow. Hodge and Co.

How best to ameliorate the condition of the poor is of all problems now pressing for solution at the hands of statesmen the one which gives rise to the greatest perplexity and the most diverse suggestions. The conditions of the problem are not materially different in Scotland from what they are in England, and for this reason Mr. Lamond's treatise on the Scottish Poor-laws, while of special interest to the public north of the Tweed, is as far as possible from having only such special interest.

The book is a new edition, revised, enlarged and in great part rewritten, of a work first published anonymously rather more than twenty years ago. It is safe to predict for it in its present form an important influence in guiding to practical issues the discussion, now become so widespread and keen, of the grave economic questions with which it deals. The author's training and experience as a solicitor, and especially his familiarity for many years with the affairs of the great Barony Parish of Glasgow, put him in a position of advantage at the outset, which a judicial habit of mind enables him to preserve throughout, with reference to the mass of facts and figures calling out at every turn for consideration and comment. Broad in his sympathies when projects of reform are in question, he yet never loses grip of what is practical.

The system of poor relief established in Scotland has from time to time been variously attacked, though of recent years hostile criticism has for the most part been directed against the administration of the law rather than against the policy or the essential features of the law. Radical objection is even now, indeed, frequently urged on the ground that the poor are worse off than they were before the legal assessment for their support came, in nearly every parish, to supersede the voluntary contribution which used in general to be relied on; and also on the ground that the effect of the change in the mode of providing for the poor has been greatly to increase the number of paupers in the course of the last forty or fifty years. Mr. Lamond faces these and similar charges against the present system with an obvious resolve to ascertain what truth, if any, underlies them, and, as the result of a full and careful investigation of the evidence, shows them to be devoid of any solid foundation in fact. In particular, as regards the statistics of pauperism, he proves that there has been no real increase since 1849, that within the last twenty years there has been a decrease relatively to the population of the country, and that within the same period there has been a decrease in the number of all classes of paupers except the lunatic class. Mr. Lamond's explanation of the exception leads him to censure the policy of the Board of Lunacy.

Having, on a survey of the whole matter in controversy, made out the existing law to be indubitably sound in principle, Mr. Lamond proceeds to examine in detail the causes of discontent which have been alleged against the administration of the law. The charge of extravagant expenditure he partly refutes and partly substantiates. As making for economy in directions where there is at present more or less waste of public money, he advocates reform in the constitution of the local managing bodies, the merging of the Board of Lunacy in the Board of Supervision, the simplifying of the law of settlement by recognising birth in such or such a parish as the sole ground of right to a settlement in that parish, and extension of the expedient of boarding out harmless lunatics as well as pauper children. With regard to the mode in which the poor rate is levied, Mr. Lamond argues conclusively against going back from assessment on rental to assessment according to means and substance, but acknowledges the existence of good grounds for complaint as to the incidence of the tax under present

conditions, and submits proposals for ensuring more equable pressure and for obviating unfair escape.

Amongst other subjects discussed with the same sufficiency of information and the same clearness of insight may be mentioned the right of appeal against the refusal of relief, the maintenance of the able-bodied while they are out of work, the classification of the inmates of poorhouses, the liability of relatives, and the status of medical officers. On all these points Mr. Lamond's views, whether they command unqualified acceptance or not, are so ably set forth as to merit at least attention and respect. His protest against the precarious tenure on which medical officers hold their appointments carries with it our most cordial assent.

Schemes for old-age pensions engage a large amount of public interest at the present time, and the activity of Mr. Chamberlain in the matter has done much to bring a plan of national insurance within the sphere of practical politics. As is only natural and appropriate, Mr. Lamond devotes a considerable section of his work to the question. With the objects sought to be achieved by those proposals Mr. Lamond is avowedly in perfect sympathy; but the outcome of his argument—an argument founded on accumulated facts—is to trust for the realisation of the ends in view, to the potent instrumentality of the friendly societies and the trade unions, and to the beneficent operation of a somewhat amended poor law.

*On the Necessary Precautions to be taken to obtain the most Benefit from the Climate of Nice and the Riviera.* By THOMAS LINN, M.D. Nice. 1891.

THIS short work consists of a series of aphorisms, with some explanatory matter, upon the rules to be observed by the invalid who resorts to the Riviera. The invalid is advised to make a point of going in-doors before the sun sets and not to go out before it rises, to put on additional clothing when going from the sun into the shade, to carry a sun umbrella, to wear smoked eyeglasses, not to overdress or walk too fast, not to remove the outer coverings at once on entering the house, to have a room facing south, to attend to the sanitation and ventilation of his dwelling, to adapt his diet to the climate of the country, to remember that the dosage of his medicines may require some change, not to travel south too fast, not to defer coming south too late in the year, not to hurry away too early in the spring, and not to expect a complete cure in one season. Most of these rules are obvious, but will be useful to novices in climatic treatment. Dr. Linn recommends the climate of Nice in the following conditions: Chronic bronchitis, with copious secretion; phthisis of the "passive" kind; chronic inflammations of the larynx, nares &c.; general debility, accompanied by dyspepsia, anæmia or hypochondriasis; diabetes, dysmenorrhœa, paralysis, rheumatism, sciatica, gout. The only affections that he thinks are definitely unsuitable to the climate are various nervous affections which he does not particularly specify. He makes light of the differences between Nice and the other Rivieran resorts, holding "that it is not possible to believe that there can exist any wonderful difference of climate in these few miles of coast, except in certain local spots accidentally made by the protection of a hill or a clump of trees." We believe the differences between Nice and Mentone, and even between Cannes and Grasse will be found to be very real and worthy of careful consideration. Nice has many attractions, especially for the less serious class of invalids or for those who only fancy themselves ill, but it is windy and unduly exciting to many patients, and the climate is more treacherous than that of Hyères, Mentone, San Remo or Bordighera. Its attractions, are however, numerous and the accommodation, amusements, &c., leave little to be desired. Needless to say, there are many patients to whom the gay and brilliant life of Nice is the greatest of snares. It avoids, however, one of the chief drawbacks of many health resorts—*viz.*, *ennui*.

*A Thousand Cases of Pulmonary Tuberculosis, with Etiological and Therapeutic Considerations.* By R. W. PHILIP, M.A., M.D., F.R.C.P. Edin. Edinburgh: Oliver and Boyd. 1892.

THE subject matter of this essay is almost wholly etiological, and it is of value because of the care taken to make the diagnosis sure. The majority of the thousand cases were examined for the presence of bacilli in the expectoration. All the ordinary etiological factors are considered in turn—occupation, sex (the proportion was 63·7 per cent. male to 36·3 per cent. female), and age—and there is an interesting chart showing that of 500 phthisical men the average height does not vary much from the standard among another equal group suffering from other affections. As regards heredity Dr. Philip found that a definite family history of tuberculosis could be traced in 23·3 per cent., a smaller proportion than is generally supposed, but in near accord with the statistics of Flint and Pollock. Although this may be the proportion of cases of direct inheritance there is, as the author points out, an even larger class who have inherited from different causes a weakened power of resistance. He found a definite evidence of contagion in 6·7 per cent., and cites examples thereof. The influence of overcrowding is well shown in the map of Edinburgh, in which are indicated the localities from which these patients came, and the bearings of this on the possible spread of the disease by infection are pointed out, although the other elements of insanitation which may favour the development of phthisis in these districts must not be overlooked. The series is further analysed with respect to the relative preponderance of bronchitis, pleurisy, fevers, measles, influenza (about 4·4 per cent.) as antecedents. There is also an analysis of complications and other conditions surrounding the disease, and the whole forms an important contribution to science.

*Descriptive Catalogue of the Pathological Museum of St. Mary's Hospital.* By J. JACKSON CLARKE, M.B. Lond., F.R.C.S. Eng., Curator of the Museum and Pathologist. London. 1891

IT is matter of congratulation that there is now hardly a pathological museum in the metropolis that has not its published catalogue; and since most of these volumes are drawn up on the same lines, those engaged in collecting material for the study of a special pathological subject will find their labours very materially lightened by reason of these publications. The existence of these valuable collections in connexion with every general hospital speaks forcibly in proof of the industry and activity with which the pursuit of pathological anatomy is being carried on; but as there is also a school to every hospital, the aim of the curators must be to provide a complete collection of specimens of the ordinary lesions as well as of those that are valuable for their rarity. The catalogue before us shows that in both these respects the Museum of St. Mary's Hospital is well stocked, and the catalogue is drawn up with excellent judgment and fidelity of description.

*Ueber das Stottern.* Von Dr. J. A. SSKORSKI, Ins Deutsche überhaagen unter den Redaction von Dr. V. Hinze. Berlin: August Hirschwald. 1891.

THIS book furnishes a thorough and scientific account of a subject which is too much neglected by the medical profession. The author places stammering among the neuroses, and believes that, while it is manifested in spasm of parts of the articulatory and respiratory apparatus, it ultimately depends upon an abnormal condition of the speech region of the cortex. His observations have been extensive and in many cases show an interesting connexion between this neurosis and other physical and psychological defects, and in the section on Etiology he shows that women enjoy a comparative immunity from this condition as well as from left-handedness and a peculiar defect of writing which he has observed, and which is described in this book. These facts, he thinks, indicate a greater stability of the left hemisphere in women.

In the section on Treatment attention is directed chiefly to

the various vocal and articulatory exercises which are used to overcome the condition; but the general measures adapted to the treatment of a neurosis are not lost sight of.

*Colotomy, Inguinal, Lumbar and Transverse, for Cancer or Stricture, with Ulceration of the Large Intestine.* By HERBERT W. ALLINGHAM, F.R.C.S., Surgeon to the Great Northern Hospital; Assistant Surgeon to St. Mark's Hospital; Surgical Registrar to St. George's Hospital. London: Baillière, Tindall and Cox. 1892.

THE profession is well acquainted with the very active share Mr. Herbert Allingham has taken in reintroducing and improving the operation of anterior colotomy. The little book before us is stated to be the result of his experience in the different forms of this operation. The style is somewhat egotistical, "I" and "my" recurring with frequency.

*Tito Vanzetti: Cenni Necrologici.* Padova: Stabilimento Prosperini. 1892.

THIS handsome octavo is a tribute to the memory of the brilliant operator and teacher who for many years held the chair of Clinical Surgery in the University of Padua. It is prefaced by the following dedication: "These writings, inspired by feelings of regret and admiration for Tito Vanzetti, are dedicated to his grandchildren by his widow and daughter, who on the third anniversary of his death have religiously gathered them together as a future incentive to virtue and to study." The writings in question are in many languages, being testimonies to Vanzetti's noble career from professional journals and from scientific reports in nearly all the countries in Europe—testimonies in which Great Britain is represented by THE LANCET alone. Unlike the majority of his compatriots the great Venetian surgeon qualified for his life work in many Continental schools. After graduating at his *alma mater* in Padua he studied under the celebrated Wattmann at Vienna and then proceeded to Russia, where he followed with close attention the surgical practice of the army medical staff. So high did he stand in Russian esteem that after duly graduating in the University of Kharkoff he was elected in that school to the chair of Clinical Surgery and Ophthalmology, in which capacity he wrote in 1844 and 1846 two memorable works embodying his clinical experience, one in French, the other in Latin, in both of which languages he was an acknowledged master. His observations on preputial calculi and on the treatment of aneurysms by compression of the artery above the tumour were admired at the time for their originality and practical suggestiveness. The latter operation, claimed by Italians for their countryman Guattani, he greatly improved upon, and in a visit to Ireland in 1844 he introduced his special modifications of it to the profession in Dublin. A few years afterwards he returned to Padua, where he held the post of Lecturer on Clinical Surgery till his death. He was in frequent communication for many years, by personal visits or by correspondence, with the leading surgeons of most of the European schools, and the list of honours—fellowships of learned bodies among the number—that were bestowed on him in nearly every Continental capital occupies a considerable part of the present volume. By none of these schools, however, was he held in greater esteem than by those of London, Manchester, and Dublin, thus contributing much to the diffusion of his fame. How far he was, especially on the continent, in advance of his time may be inferred from the fact that in 1846 he was the first to perform ovariectomy in Russia and in 1859 the first to operate successfully for the same disease in Italy. The Signora Vanzetti did well to compile this record of her husband's achievements, of which the above instances are given only to supplement those reproduced from THE LANCET of Jan. 21st, 1888, when we published the obituary notice which now reappears with the official biography of Tito Vanzetti in the beautifully printed volume before us.

# THE LANCET.

LONDON: SATURDAY, AUGUST 27, 1892.

THE advent of a new Government to power and the appointment of an eminent physician and sanitarian as Secretary of the Local Government Board concurrently with the clearly expressed opinions of public associations induce us, after a considerable lapse of time, to advocate once more in our columns the formation of a Public Health Department of the State. The need of such a department has, indeed, been frequently insisted on by us (*vide* more particularly THE LANCET of Jan. 18th, 1879, and of Jan. 31st, 1880). Briefly, we pointed out in these articles that the care of the public health should form an integral part of State policy; that there should be centralisation of health organisation and administration, and that the narrow interests of localities should be merged in the broad exigencies of national health. We also showed how the Medical Department of the Privy Council, of which the activity is but the shadow of former times, had retrograded since its amalgamation with the Poor-law Board and had become involved in the meshes of official "pauperism," and we endeavoured to draw a distinction between State and parochial medicine. What we wrote then holds good and with greater force now. Notwithstanding the splendid work of the Medical Department of the Local Government Board under the brilliant guidance of Sir GEORGE BUCHANAN and Dr. THORNE THORNE this department is but an incomplete specimen of what a public health bureau should be. Its alliance with and incorporation into the old Poor-law framework deprive it of active initiative, and account for the almost heart-breaking delays which occur at important crises in the life-history of public hygiene. The placid routine of pauper administration is not easily disturbed to make way for broad and energetic measures of State policy. Nor is it always possible for the same presiding genius to regulate with equal ease and efficiency the interior economy of a workhouse and to cope with an invasion of cholera or small-pox. Truth to say, this unnatural union of Poor-law and public health is in urgent need of being dissolved, and the sooner the better for the larger interests of the kingdom. Thus divorced the present medical department would form an admirable nucleus of a State office in intimate relation with the local health administration of the country. An analogous process has taken place in the formation of a Board of Agriculture from the Agricultural Department of the Privy Council. Granting the movement of decentralisation, as evinced in the establishment of County Councils and possibly of District Councils, the advantage of Imperial control will generally be acknowledged. And this control would be better and more efficiently exercised by a board in direct and sole *rapport* with the subordinate bodies than by the present Local Government Board, which, as we have shown, is still largely tinged by Poor-law methods. The formation of such a controlling authority would tend to greater unity of administration, so much to be desired in

London, and to more regular and systematic inquiry into the sanitary condition of the kingdom generally, which at present is incomplete, spasmodic and ruled by panic. As regards the Minister who is to preside over such a department, he must of necessity, owing to our system of party government, be a politician; and ought, from the importance of his office, to belong to the Cabinet. But the question whether he should be a member of the medical profession or not, as well as other matters relating to the most desirable constitution and arrangement of offices in the event of the formation of a Public Health Department, we must leave for discussion on a future occasion.

A CONTEMPORARY recently suggested that all persons proposing to climb the Matterhorn or other difficult peak should be treated as dangerous lunatics and forcibly restrained. The implication is that mountain climbing is a foolish and useless practice which ought to be discouraged by every means in our power. To this view we can by no means give our adhesion. That the practice in question has considerable dangers, that it needs to be exercised under proper rule and guidance, that for many individuals it is undesirable and even hurtful, all this we admit; but we also hold that there is a large class for whom mountain climbing is what it has so often been described by its enthusiastic patrons—*viz.*, one of the most healthful and exhilarating forms of out-door exercise. We propose to consider for what classes of persons it is suitable and some of the rules by which it should be regulated.

As negative rules are usually easier to formulate than positive, we may begin by specifying some classes for whom mountain climbing is ill adapted. First, there is the senile, and by them we mean not only the senile in years, but the senile in vessels and tissues. The elderly man who has been a practised mountaineer for many years may continue the pursuit not only, as a rule, without danger, but with great advantage. On the other hand, there are few men turned fifty who are sufficiently sound in wind and limb, sufficiently free from degeneration of heart and bloodvessels, to begin a practice involving so much strain as does mountaineering—at least in its more ambitious forms. Many of the most deplorable accidents annually reported from the Alps are cases of elderly men, sedentary livers during the greater part of the year, and with consequent flabby heart and muscles, who hurry off to Zermatt or Pontresina, and at once proceed to attempt feats which should be reserved for the mountaineering adept. The result in not a few cases is acute dilatation of the heart or rupture of a bloodvessel, and either sudden death or lifelong enfeeblement. Persons such as we have described should, as a rule, eschew mountain climbing altogether and take to some out-door pleasure involving less strain, such, for example, as yachting or golf; but if they are ambitious to become mountaineers they should first consult their physician and obtain an assurance that they are free from serious organic defect, and then they should begin with modest feats and only essay the more difficult ascents when they have proved the adequacy of their powers to those that are easier.

Apart from senile change, heart disease in any form must be regarded as an effectual bar to mountaineering. We do

not undererate the great importance of regular and graduated exercise to patients suffering from cardiac disease, but they must carefully shun any steep or difficult ascent. The same rule must apply to most cases of serious affections of the lungs. No doubt the patient with quite incipient phthisis or with chronic pleurisy or an imperfectly resolved pneumonia may most advantageously undertake moderate climbing excursions in a mountainous country, but the more difficult tasks are not for them. Highly neurotic persons do not make good climbers, partly because the keen mountain air unduly excites their nervous systems, and partly because their self-command may fail at some critical point. But the commonest error, as we have already hinted, is for persons who are quite out of training to rush off to the Alps and begin without any adequate preliminary preparation tasks that try to the utmost the powers of the professional guide or the trained mountaineer. *Vestina lente* is a good rule in most of the concerns of life; it is absolutely indispensable in mountaineering.

Let us now consider a few of the rules which should regulate mountain climbing in the case of those who are not in any way incapacitated for it. The climber should start early with the double object of economising time and of getting away from the hot valleys before the sun's heat has attained its maximum. Experience seems in favour of taking only a light breakfast, say of rolls, coffee and eggs, before setting out. The question of dress is very important. The mistake is often made of starting for one of the higher peaks in very light garb. The climber feels very comfortable for the first few hours, but when he gets among the snows, when, perhaps, keen winds from the neighbouring glaciers begin to blow, he longs for the thickest of tweeds and the warmest of underclothing. A stout waxed cap, with lappets for the ears, warm gloves, and thick nailed boots are indispensable for any prolonged tramp among glaciers or snow-fields. A cardinal rule is to begin the ascent slowly and never to excite dyspnoea by undue rapidity of movement or over-exertion. If the climber begins thus he finds after an hour or two that his initial fatigue begins to vanish, he gets habituated to the pace, the keen and rare mountain air acts as an admirable tonic, and he can maintain his efforts for many hours without exhaustion. Foot soreness must be guarded against by those predisposed to this troublesome affection. Strong boots and good stockings do much to obviate it; soaping the stockings or sprinkling them with bismuth and oxide of zinc, and on the first appearance of signs of irritation the application of a weak whisky lotion, are the chief measures to be recommended.

The question of food and drink *en route* is an important one, regarding which each mountaineer is more or less a law unto himself. Many climbers seem to do best on very light nourishment—a sandwich, a piece of chocolate, and a glass of milk or small cup of black coffee—reserving the serious repast of the day for the evening; but there are others who seem to climb best with a fairly substantial midday luncheon and a moderate allowance of wine. There is no doubt that, controversy apart, the professional guide almost always drinks wine, and very frequently brandy besides. This is, however, not by any means a conclusive argument in favour of alcohol for the mountaineer.

We might enlarge much more fully on this interesting question, which is opportune at the present season, but for the present we must conclude. Mountaineering is too well established in favour, too thoroughly acknowledged as a source of one of the keenest and purest of pleasures, to be put down by a sneer or ruled out of favour because it has serious dangers or because there are many to whom it is necessarily forbidden. Most of the best things are the most open to abuse. This is true of mountaineering.

In a thousand ways the alleviation of the lives of our labouring poor is becoming a question of imperial importance. The more favoured part of the community finds itself forced, even in self-defence, to turn its attention to the less favoured and more numerous part, to interest itself in the present and the future of the great army of workers and to do its best to minimise the hardness and relieve the gloom of their lot. To promote what WORDSWORTH, in a memorable passage, calls "the spirit's health," as a means of counteracting a debasing resort to mere sensual indulgence, is a form of this alleviating policy from which the best results may be anticipated. To rouse, stimulate and develop the love of the beautiful, in Nature first and then in Art, is a primary step towards this end—a step, moreover, with which the great working army aforesaid will readily fall in, till it can direct and accelerate its own advance onwards and upwards to fresher vistas and ampler horizons. It is really astonishing to contemplate the powers of appreciation of whatever is noble and refined which are latent in the lower orders of town and country, and it is humiliating to reflect how little the leisured and moneyed classes have done to give those powers the free scope and the opportunities which are all they ask. In the whole range of poetry there are few passages more touching than the stanza in ALEXANDER SMITH'S exquisite idyll entitled "Glasgow," in which the humble pattern-drawer, afterwards Secretary to the University of Edinburgh, depicts with the stroke of a master the ecstasy of the artistic soul struggling to follow the beckoning finger of Nature from among the dingy and dark surroundings of his early life:—

"I dwelt within a gloomy court  
Wherein did sunbeam never sport  
But yet my heart was stirred,  
My very blood did dance and thrill  
One morn when on the window-sill  
Spring lighted like a bird!  
Poor flowers! I watched them pine for weeks  
With leaves as pale as human cheeks.

And yet, with all this full and ardent response to the invitation of the beautiful, the cold obstruction of labour unrelieved was interposed between him and his fruition:

"Before me lies a road of toll  
With my grave cut across."

Of how many millions may not this bitter truth be said; Of how many thousands of the more favoured class may it not be added that, possessing all and more than all the advantages denied to those poorer ones, they have done nothing to give them even a glimpse of the beautiful in which they bask?

A beginning has been made and has, indeed, for some time been in progress towards wiping out this stain on the record of the upper classes. Mr. CHARLES JENNER—to whose coöperation in the movement for evoking a love of flowers in

childhood and for making that love, as expressed in floral culture and arrangement, contribute by annual exhibitions to the support of children's hospitals we lately alluded—is at the head of a yet greater enterprise, that of the Working Men's Flower Show with Help from Wife and Child. He encourages the artisan and labouring citizen to devote such leisure as they can command to the study, the culture and the tending of flowers, carried on in "window gardens" with what sunlight is vouchsafed to them. The response to this truly enlightened and philanthropic suggestion surpassed even its author's anticipations, and in the last exhibition of the products of these amateur gardeners in the Edinburgh Corn Exchange he had the most gratifying proof that the seed of self-education and self-refinement he had sown had fallen on congenial soil. Himself a recognised authority on cryptogamic botany, he says in an eloquent letter to the *Scotsman* how much he had to admire in "the long tables of our most beautiful and rare native ferns, plants in perfect health and condition, cultured in the central purlieus of our Old Town and in suburban districts." He also drew attention to such "conifers of perfect symmetry and exquisite beauty as the *Araucaria excelsa*" and to "the many young palms and heaths" also on view at the exhibition. "The collection of cryptogamic plants, as a whole," he adds, "was most commendable, and proved that our laborious working men, their wives and children, had the most refined sense of correct, pure and elegant form independent of colour." One instance he dwelt upon with justifiable satisfaction. "A fine clump of *Asplenium septentrionale* won my close attention. Ten years of continuous patient care of a tiny bit of root from a cranny on the precipitous heights of Salisbury Crags has won from Nature this noble reward of honour to the adventurous climber. Such nobility of spirit, combining courage and perseverance with the gentle art of fern culture, deserves higher recognition than this poor praise of mine."

The Working Men's Flower Show with Help from Wife and Child in the Edinburgh Corn Exchange was memorable not only for what it placed on view, but for the social horizon it opened up. From the lowly pot of mint grown at the one window of a garret to the "begonia five inches high, with two blossoms of glorious splendour, that might have graced the window of a palace," the encouragement to the poor denizens of such squalid quarters as the West Bow and the Cowgate is such as to stimulate their growers to efforts ever higher, till the whole life of the artisan in "populous city pent" becomes brightened, sweetened and elevated. Well may Mr. JENNER ask the higher classes if they ought not to "encourage this dawn of refinement among toiling men, women and children." Their presence at such shows, even more than their open-handed liberality—though this, too, should not be wanting,—cannot fail effectively to promote and strengthen this most philanthropic, most salutary movement. The future lies with the democracy. Is it not in the best, aye, even the most material, interests of the leisured and moneyed classes that they should by every means encourage the growth of a chastened and enlightened spirit in that democracy and so ameliorate the lives of its individual members as to humanise it, ennoble it, make it aggressive only against the uncivilised and the retrograde? Nature herself points out the means by which the savage element

in man may be mollified and refined. Exhibitions like that recent one in Edinburgh are full of symbolism possessing a moral and a social significance. Even as the poet's "gloomy court," unvisited by the sunbeam, ungladdened by the solar warmth, may yet be brightened and illumined by fresh leaves and flowers themselves, so the "spirit's health" of its inmates may be quickened and strengthened, touched to finer issues and turned to a nobler account than was possible under the traditional system of social exclusiveness and neglect. A more educated, more healthily evolved labouring class forms the substratum of a more normally developed, of a robuster, more masculine community; vice is combated at its most prolific source, and its inevitable progeny of pauperism and disease declines for lack of appropriate nutriment. Time-worn truths these, no doubt; but requiring constant restatement in response to still more constant indifference to them, until, with the spread of such movements as that of the Working Men's Flower Show, their relevance becomes less and less appreciable as the conditions which justify them tend to disappear.

IN our last issue we published the Report of our Special Commission on Sanitation in relation to the Law and Practice of House-letting. This report makes evident an important fact: that the principal house agents are fully alive to the need of some better system than now exists, by which persons taking houses can be protected against injury from faulty drainage. The fact has to be reckoned with that only in comparatively recent years has the importance of house drainage come to be understood, and only during this time have local sanitary authorities been in a position to require house drains to be properly constructed. Hence the majority of houses have been erected under conditions which have allowed the builders to neglect to make drains air-tight or water-tight or to provide any means for aerially disconnecting the house drain from the sewer or cesspool or for its sufficient ventilation. As a result, in many cases the drainage of existing houses has to be reconstructed and this often at great expense. The cost of the reconstruction of drains of houses which are let on lease falls on the leaseholder, who often has not many years' interest in the house. In the case of houses let on a three years' agreement or annual tenancy the cost properly falls on the owner of the house.

But the question arises as to who should be responsible for ascertaining that the drainage is reasonably perfect. In the letting of a furnished house there is an implied guarantee that the house is in a proper sanitary condition, and the Housing of the Working Classes Act extends the application of this principle to unfurnished houses or parts of houses of very small rental and occupied by working people. The unwholesomeness of the house, however, only comes to be considered when a court of law is satisfied that some injury to health has resulted from its condition. Nevertheless, the fact that the landlord is liable to an action for damages when this has occurred has had a useful effect in leading to the reconstruction of house drainage in many instances. In the letting of unfurnished houses above this small rental there is no implied guarantee and only the principle of *caveat emptor* obtains. The intending house occupier

must take care of his own interests and must himself obtain such aid as is necessary to ascertain the condition of the house before he becomes a tenant.

The position of the sanitary authority deserves careful consideration. Obviously it is the duty of this authority to prepare by-laws which shall determine the principles upon which house drains shall be reconstructed and to make such inspections and examinations as will ensure that the work has been properly carried out. If this be honestly and carefully done in all cases in which houses are newly erected or in which house drains are reconstructed, in course of time the faults which exist in many houses will disappear, but the process must be slow; and again, however perfectly the work may be done, it will not last for all time, so that there can be no absolute certainty that drains which have been constructed under these conditions are always in the state which more recent opinion holds to be necessary. Some other system is therefore required; particularly to safeguard the individual who takes a house for a short period, or who merely wants lodgings, and who therefore ought not to have the burden thrown upon him of examining for himself the actual condition of underground drainage or the perfection of soil-pipes.

Our Commission has expressed the opinion that the system which is in force at Eastbourne is that which is the most convenient and which affords at the same time the greatest amount of security. In this town, and also, as we are now informed, in Folkestone, the sanitary authority keeps a register of houses which it has examined and found to be in a satisfactory state. There is no obligation on the house-owner to apply for his house to be entered on this list, but it is obvious that the fact that the sanitary authority is prepared to vouch for its condition is a distinct advantage to the owner if he desires to let any part of it, and is a considerable encouragement to him to incur the expense necessary to raise it to the required standard.

In an able leading article in *The Times* on the report of our Commission it is very properly pointed out that the desire to maintain the reputation of a fashionable watering-place like Eastbourne would not operate with sufficient force in districts in which the sanitary standard is pretty sure to be mischievously low. This is undoubtedly true, and we must anticipate that a number of years must still pass before the public sentiment is sufficiently aroused to bring about the changes which are necessary. But, as *The Times* shows, we may rely on the example of more advanced districts, and eventually it may be hoped that the demand for improved conditions will not be limited to those who are influenced by consideration for the reputation of their town.

In districts occupied by poor persons who are less keenly alive to the disadvantage of living in badly drained houses the responsibility thrown upon the sanitary authorities is obviously greater, for the reason that persons of this class are less able to protect their own interests. In these localities it is more incumbent upon the authority to ascertain that the house drain does not constitute a condition dangerous to health, and there need be no fear of opposition to any authority which makes it the practice to examine and test drains in its district. No doubt in some districts the authority is too largely represented by those who are themselves the owners or builders of houses which are faulty in this respect;

but there has been during recent years a definite advance of opinion on this subject which must eventually influence the constitution of boards appointed to safeguard the public health.

Our Commission has shown that the law contains very ample provisions empowering sanitary authorities to require that house drainage must in the future be properly constructed; but, as we have already stated, there are in existence many houses which are faulty, and no one proposing to take a house must rely on the official machinery unless, as in Eastbourne and Folkestone, some special system is adopted. But even in these towns it must be recollected that only a proportion of the total number of houses is affected by this system, and for the rest, as elsewhere, the tenant must depend upon his own investigation or that of those whom he employs. We believe a large amount of the difficulty which now occurs is due to the fact that the public is entirely ignorant of the position of the law and is too much disposed to believe that any house a person may happen to take is in proper sanitary condition. It would no doubt be impossible at the present time to impose by law upon everyone letting a house the responsibility of guaranteeing its sanitary condition; but we think there would be a definite gain if some steps were taken which would make it clear to everyone whether or not the lessee was entitled to expect that the house he was taking was in this state. This would impose no hardship on either party to the contract; it would simply require the fact to be stated in every agreement or lease that the lessor did or did not guarantee the sanitary condition of the house, and it is not probable that Parliament would raise any objection to so simple a requirement. It would remove all doubts from the mind of the tenant and it would direct attention to the condition of the house, whatever it might be; and it would then be for the proposed tenant to take any steps in his own interest which he considered to be necessary.

## Annotations.

"Ne quid nimis."

### IMMEDIATE CHOLERA PROSPECTS.

THE sudden and severe outbreak of cholera at Hamburg is an event of great importance in so far as this country is concerned. Happily it had been foreseen. Two weeks ago we announced that certain ports, such as London, Grimsby &c., had been visited by Dr. Theodore Thomson on behalf of the Local Government Board with special reference to the emigration of Russian Jews from Hamburg into this country, and this was speedily followed by an order prohibiting the admission of bedding, disused clothing &c. from a number of ports in the German Ocean and from the Baltic into this country. On the 23rd inst. the Hamburg authorities admitted that cholera was prevailing there, and news followed which went to show that the outbreak was of a very extensive and fatal type. The rapidity with which the disease has managed to travel by means of German railway lines carrying Russian emigrants to the North Sea has brought us face to face with an infection having the full force of the Eastern disease, and from this point of view the occurrence is more serious than if the infection had reached so near a point after longer travel and

by a more distant route. The journey between Hamburg and our ports is so short that we may find apparently healthy people landing on our shores only to sicken after arrival. This is, in fact, what has already happened at Grangemouth, in Scotland, the patient arriving one evening and only falling ill in the early hours of the following morning. But this is what English sanitary authorities have all along been told it was their duty to face and to be prepared for. The circumstances, too, are in most respects like those which we had to meet in 1884, when trains and boats passed uninterruptedly from Paris to London, notwithstanding the existence of hundreds of cases of cholera in the French capital. The present occasion is perhaps more serious by reason of the early stage in the epidemic at which the infection has reached Hamburg, and because there can be but little doubt that a similar danger has to be anticipated from actual cholera at Havre and probable cholera at Rouen. We have already referred to the action taken by the Local Government Board some weeks back. We are also in a position to say that Dr. Parsons, Dr. Barry, Mr. T. W. Thompson and Dr. Theodore Thomson have for some days past been in personal conference with those of our port authorities whose districts are most likely to be affected by cholera at Hamburg and at Havre, and that a number of other measures are in contemplation should the disease extend to this country. But, after all, a central government can do but little in such an emergency to remove the causes by which cholera spreads in our sanitary districts. The main action must, in the end, be taken by our sanitary authorities, who have local knowledge as to their own needs and have ample powers enabling them to deal with defects calling for immediate action. The existence of cholera at Hamburg, and even the importation of a few cases into this country, by no means implies an epidemic; but at the same time we would repeat our recent warning as to the serious responsibility which devolves on sanitary authorities who fail to deal with such obvious conditions of disease as water-supplies liable to pollution, faulty sewers emitting foul emanations, methods of excrement disposal such as the midden privy, by which accumulations of filth are deliberately collected close to dwellings, and the like. In one way or another the warning has often been given, and it has been coupled with the knowledge, to which but few Englishmen can be strangers, that action which succeeds in freeing the water we drink and the air we breathe from the risk of contamination by excreta, is action which gets rid of the principal channel by which cholera can travel, and which in consequence places the populations benefiting from such circumstances in a condition which enables them to view cholera with comparative impunity.

#### THE CLOSING OF HOSPITALS.

SEVERAL complaints of the closing of the London Hospitals during the present period of the year have reached us, and that the idea of injustice or of lack of consideration is not confined to London is evidenced by a long communication in an Edinburgh paper in which similar complaint is made of the closure of several of the Edinburgh dispensaries. The question which it is attempted to raise is a somewhat serious one—viz., Are these institutions carried on for the benefit of the sick poor or of the medical profession? The line of argument appears sufficiently clear, but it is by no means satisfactory. If, it is urged, the hospitals close entirely or in part during the ordinary time of vacation, and are restored to their full efficiency with the commencement of the winter session, the inference of their existence primarily for the good of the schools appears to be conclusive, and hard words can be meted out to the committees and authorities responsible for wanton disregard of the needs of the sick poor. Stated in this bald fashion

the grave charge of blundering and want of foresight seems to be fully warranted; but, on the other hand, it must not be overlooked that hospitals, far more than ordinary habitations, need frequent thorough cleansing and repair, and that though undoubtedly serious inconvenience may be caused if a large number of hospitals are simultaneously closed, it is relatively rare for such simultaneous complete closure to be necessary in many hospitals. When any great structural alteration is essential—when, for example, drains have to be reconstructed—the responsibility attaching to any temporising or half measures would be enormous, and it seems to be a more fortunate accident that the work should be decided upon at a time when in the ordinary course of events the applicants for relief are fewest in number. It must not be forgotten that large numbers of the poor migrate for various reasons at this time of the year. Harvesting, hop-picking, friends in the country, all tend not only to actually reduce the number of the poor in London at this season, but also to send them back so far benefited by the change that need for hospital relief is less imperative. Even in the hospitals which remain fully open during vacation experience does not point to any special strain upon their resources owing to insufficiency of accommodation for urgent cases. From inquiries which we have made we learn that Charing-cross Hospital has been entirely closed since July 17th on account of drainage works, and that it will be reopened on Sept. 5th. It was originally intended that the Middlesex Hospital should be entirely closed for two months to enable extensive alterations and repairs to be effected to bathrooms, floors &c., but on its becoming known that two other large general hospitals in the neighbourhood were also closing at the same time the authorities made arrangements for keeping open about 170 beds. At the Royal Free Hospital and at King's College Hospital the beds in use have been reduced in number for the annual cleaning, whitewashing &c., but the time of closing has been curtailed as much as possible, and only such repairs as were imperatively necessary have been executed. In both of these hospitals the out-patient departments have also been closed for cleaning for a short period; but arrangements were made for attending to all urgent casualty cases and to all special out-patient cases, so as to avoid any neglect where immediate treatment or change of treatment was necessary. Similar statements have been received from St. George's Hospital, St. Bartholomew's Hospital, and the Westminster Hospital, while so far as we have been able to ascertain the only other hospital, in addition to Charing-cross, which is completely closed is University College Hospital, and we are informed that the serious amount of repairs required rendered this course an absolute necessity. Our inquiries have fully satisfied us that every reasonable precaution has been taken by the authorities of the different hospitals to minimise the inconvenience inseparable from alteration of routine and to ensure the sanitary surroundings by necessary repairs. From time to time it unfortunately becomes expedient for nearly every hospital to be thoroughly closed, but it does not appear that in any case at the present time this closure has been effected without due consideration of the conditions in other hospitals.

#### THE DANGERS OF READY-MADE GARMENTS.

IN THE LANCET of Aug. 13th we took notice of the suspicion of uncleanness which we fear must, at all events under present conditions of trade, remain inseparably connected with our clothes, and especially with all bought underwear. So long as it is customary for clothiers to send out, practically at random, their material in the form of piece-work, so long will it be impossible to guarantee either its wholesome or its cleanly condition. Neither can it be denied that the inconvenience and even danger implied in this practice

are much enhanced by the prevalent system of "sweating." While this continues anything like effective cleanliness is hardly to be looked for, and we have in that fact a substantial reason for the repression of this injurious form of forced labour. Were it abandoned the selection and supervision of suitable homes in which piecework might be carried on would at least be much easier than it is at present. The case of public laundries is at once different and similar. Thanks to the nature of the work there is less risk of impurity. We should nevertheless be pleased to see some form of inspection applied to these establishments. As to the needless, haphazard and thoroughly unbusiness-like practice of trying on underclothing forwarded on approval, the sooner this is discontinued the better. In existing circumstances every purchaser of ready-made clothing must understand that he has really no protection against the activities either of contagious germs or of the more evident animalcules save the maxim, *caveat emptor*.

### THE HEAT WAVE AND ITS CONSEQUENCES.

WHILST we have in this country been lately favoured with very enjoyable weather, it has been far otherwise for those living in the large cities of America, in Italy, in Spain, in the greater part of Germany and in large tracts of France. There the heat has been intense, the temperatures registered have been tropical and the suffering and loss of life among men and animals have been of quite an exceptional character. In New York and Chicago, in addition to cases of sunstroke and accounts of men and animals falling down unconscious or dying in the streets from the effects of heat, the infant mortality suddenly ran up, as it so often does under such circumstances, to an alarming figure. At Trieste we read of 110° F. being registered in the shade, while the temperature of the sea water was 90°. There seems to have been a remarkable heat wave passing over the Continent, and the depressing effects of direct solar heat have been much augmented by the presence of sirocco winds. We learn that there were 200 soldiers of the garrison of Tours in the hospitals, and that the time of the military manœuvres there coincided with that of the heat wave; that the temperature ranged from 117° to 127° in the sun, and that the amount of inefficiency from sunstroke and heat exhaustion among some of the troops who took part in those manœuvres was so large and its occurrence so sudden as to be little short of overwhelming. But there is no need to enumerate the various places abroad, concerning which somewhat similar details have appeared in the daily papers. Something of the same kind is a nearly annual recurrence. It is a question of degree, and this year the heat seems to have reached a much higher point than usual and to have been attended with a corresponding amount of sickness and mortality. The ill effects of heat on the body do not always give rise to the same phenomena or manifestations, but they are nevertheless the varied results of one and the same cause and pathologically are allied to one another. The mechanism by which they are brought about is through the nervous system; but the heat is not, in many cases, the only or even the dominating factor present. A man falls down pulseless, or nearly so, from heat exhaustion, as the result of exertion and fatigue in hot weather, with a pallid face and a cool, perspiring skin. If he is placed in the shade, exposed to a current of air in the recumbent posture, and given a stimulant, he soon recovers. An infant or child living in a city suffers from diarrhoea attended with notable prostration. The illness is mainly attributable to the depressing effect of heat and a vitiated atmosphere on the child's nervous system. The best thing is removal to the seaside or country; if children were sent away from the defiled atmosphere of overcrowded towns as soon as the hot weather began they would be spared a large

amount of suffering, sickness and mortality. If this cannot be done, the great thing is to keep them as cool as possible in a well-ventilated room. Sunstroke and heat apoplexy, however, are forms of heat fever of a formidable kind, in which the temperature of the body rises rapidly, attains a high figure and is attended with unconsciousness and danger to life. In sunstroke the solar heat acts directly on the brain and spinal cord, whereas in heat apoplexy the attack may occur at night in crowded tents or houses and is commonly attributable to other causes than heat alone. The best methods of guarding against these effects of heat are the simplest and most obvious—viz., garments light in colour and weight and loose enough to admit of free action of the skin and respiratory movement and the circulation of air currents; the occupation of airy and spacious rooms and temperate living; the avoidance of causes of fatigue and depression and an open-air life, together with abstention from exercise and exposure at those periods of the day which common sense would indicate as the least suitable. The important pathological fact to be considered and dealt with when sunstroke or heat apoplexy actually occurs is the exalted temperature of the body; the reduction of this abnormal temperature is the primary consideration, and its accomplishment by the application of cold to the surface—cold water, ice, and currents of air—is the matter to be at once attended to. Apart from these phenomena, the immediate and remote effects of heat on the nervous system are sometimes very serious. Maniacal delirium may occur at the time of the attack, and the patient be afterwards very liable to suffer from violent neuralgic headaches, sleeplessness and irritability, and to be unable to remain in heated or crowded rooms or expose himself to the heat of the sun.

### REMOVAL OF HUMAN REMAINS FROM THE VAULTS OF A CITY CHURCH.

DR. TRISTRAM, Q.C., Chancellor of the Diocese of London and Judge of the Consistory Court, delivered judgment on the 29th ult. as to the removal of the remains in the vaults of the Church of St. Mary-at-Hill. These comprised a very large number of bodies, the last interment having taken place in 1844. According to the reports of Dr. Sedgwick Saunders, medical officer of health for the City of London, and of Dr. Hoffman, the medical inspector to the Burial Acts Department of the Home Office, and to the evidence of the churchwardens, an unwholesome effluvia permeates the church from these vaults owing to their present condition; and in the opinion of Dr. Saunders such effluvia is injurious and may prove dangerous to the health of the congregation attending the services of the church. These facts having been made known to the Home Secretary, an Order in Council was made, dated May 9th, 1892, upon the churchwardens, or such other person or persons as may have the care of the vaults under the church, to adopt or cause to be adopted the following measures—viz., that all human remains found beneath the floor of the parish church of the united parishes of St. Mary-at-Hill and St. Andrew Hubbard, in the City of London, shall be removed and forthwith reburied in Norwood Cemetery or in some other consecrated burial ground in which interments can legally take place, the work to be carried out under the supervision and to the satisfaction of the medical officer of health for the City of London. This order was served upon the churchwardens of the united parishes, who applied to Dr. Tristram for directions thereon. The propriety of this conduct was lauded by the learned judge, who explained at considerable length that it was only through a faculty granted by the court over which he presided that the churchwardens could have the care of the vaults of the church. It will be remembered that in the case of St. Botolph's Church, Aldgate, last year, a conflict took place between the ecclesiastical and the civic authorities.

It was proposed to re-enter the dead from St. Botolph's churchyard in the crypt under the church, a proceeding which Dr. Tristram sanctioned, forgetting or ignoring the fact that even in the capacity of the Chancellor of the Diocese of London and of Judge of the Consistory Court he could not over-ride the Order in Council which had closed the crypts against any future interments. As was pointed out in THE LANCET at the time, the only proper course was to remove the remains to the nearest convenient extra-mural cemetery, which after some demur was done. In the present case, as will be seen, the Order in Council requires this to be done, and the Chancellor has granted not only the faculty asked for, but also every facility towards carrying it out, due regard being had to the fabric of the church, and every guarantee being given that such portions of the interior as might be removed should be duly replaced. Thus the dead will once more be removed from the vaults of a city church to a suburban cemetery to be properly buried. It is to be feared that there are still some churches within and around the city whose vaults contain a number of human bodies from which an effluvia permeating the church is simply a question of time. Would it not be well to have a church to church inspection by a competent sanitary inspector, so as to ascertain what is the state of the vaults of each. It may be that in some cases any further mischief may be avoided by entombing the remains in concrete; in others speedy removal to an extra-mural cemetery may be imperative. The possibility of inhaling such an atmosphere as the clergy and congregation of St. Mary's have experienced is a more than plausible reason for preferring a distant church to one in the City.

#### CHOLERA AT GRANGEMOUTH.

WE have received from Dr. William Walker, medical officer of health, particulars of the case of cholera which occurred at Grangemouth. Dr. Walker was called at 8 A.M. to see a German seaman reported to be ill on board the Hamburg steamer *Helene Sauber*, which had arrived in dock the previous night. The captain stated that at about 3 A.M. the man had been seized with severe pains in the bowels, accompanied with violent purging and vomiting. After several evacuations he became exhausted and fell upon the deck. He was then carried into his berth and rubbed down to relieve the cramps in the legs, from which he suffered greatly. Nothing further was done until 7 A.M., when the captain administered some cholera drops which he had brought on board from Hamburg. After waiting half an hour, as the man seemed quite exhausted, medical aid was sought. Dr. Walker at once recognised the nature of the disease, having seen similar cases abroad. The skin was cold and moist; no pulse could be felt at the wrist; the feet and hands had assumed a bluish colour, the hands having a shrivelled appearance as if from long soaking in water; the lips were purple, the tongue a leaden hue and sensibly cold to the touch. The eyeballs were small and buried in their orbits, the lower lids drooping. The breath felt "like a cold air stream"; the temperature in the axilla was 92°. The man complained of great heat in the epigastric region. His voice was feeble and whispering. He turned from side to side in a very restless manner. Respiration was embarrassed and great difficulty was experienced in distinguishing the cardiac sounds. On examining the alvine discharges on the bed and in his trousers a thin, pale, turbid fluid was found, the characteristic rice-water stools of cholera morbus. From the above symptoms it will be seen that the algide stage had set in before the patient came under treatment; so that all that could be done was to order stimulants, brisk friction to the limbs, and warmth to the body. The man was promptly removed to the Grangemouth Hospital and,

when there, ammonia and ether were administered. The patient rapidly became worse, the respiration more impeded and the comatose condition more pronounced. Dr. Fraser of Falkirk saw him shortly before his death, which occurred at 2.30 P.M., and entirely agreed with the diagnosis of cholera morbus. The post-mortem examination made by Dr. Proudfoot of Edinburgh clearly pointed to cholera as the cause of death. Although no details of this examination have yet been supplied to us, from Dr. Walker's careful description there can be very little doubt about the true nature of the case.

#### "A DANGEROUS REMEDY."

A CORRESPONDENT of the *Morning Post* of Aug. 17th draws attention to the fact that several fluid preparations are in the market termed "weed killers." It is alleged that on analysis these have proved to contain arsenic. The fluid is intended to be poured on garden paths &c., to destroy and prevent the growth of weeds. No doubt the desired object would be attained by such means, but at the same time we fully endorse the contention that the employment of the fluids in question would be a source of danger to health. On evaporation the arsenic would be left in a pulverulent condition, and thus in a most favourable condition to contaminate the atmosphere in the same way that particles are given off by wall papers. If the sale of the preparations is to be allowed to continue, it ought to be on condition that the ingredients are printed on the labels so that those who employ them may know of the danger they are running. We feel sure that the knowledge so obtained would at once in the majority of instances suffice to put a stop to a practice which we think will be found to be injudicious.

#### OPERATION FOR TRAUMATIC EPILEPSY.

IN the last number of the *Archives de Neurologie* Drs. Manoury and Camuset record at length a case in which trephining was performed for epilepsy, which was subsequent to an injury and a resulting depressed fracture. The case is important on account of the notable failure of the operation to modify the condition in the slightest degree. It must be confessed that from the first it was almost a hopeless case, but it may be useful to describe it as indicating the kind of case in which operation is not likely to be followed by any good result; and as Drs. Manoury and Camuset themselves remark, their observations go to confirm the facts, generally admitted at the present time, that the long duration of attacks and the appearance of dementia should serve as contra-indications of operation. The patient was a young man of twenty-three, with no evidence of neuropathic inheritance except that a paternal grand-uncle had suffered from fits. Except for a convulsion at eight months he was healthy up to the age of fourteen, when he met with a serious accident—a kick from a horse, which fractured his skull anteriorly and laterally. The wound healed rapidly, but three months later he had the first epileptic attack. The attacks recurred and with increasing frequency as he became older. At the age of twenty he suffered from at least one a week, and he was also undergoing a psychological change which had resulted at the time of his admission at the age of twenty-three in a condition of dementia. The attacks which were observed were general, without any aura or motor symptoms indicating local damage to the brain on one or the other side. There was a well-marked cicatrix ten centimetres long over the upper part of the right frontal and parietal bones. At the operation it was found that the bony surface was rough and presented irregular depressions. Similar depressions and prominences were also visible on the inner surface, but there were no adhesions between the dura mater and the bone. The dura mater apparently was not

opened, and consequently the condition of the cortex was not examined. Briefly, the result of the operation was at first to increase the number of fits, but soon the former level was reached. Thus in the first month after the operation there were thirty-six fits, while in the second there were only seven-teen, and in the third the same number—a condition which did not materially differ from that which was present before operation. There was no change in the psychical condition, so that the operation may be said to have been absolutely without any beneficial effect on the patient. When the severe character of the original injury is considered and the length of time which elapsed before the operation was undertaken, it is not to be wondered at that the cortex had become so changed that a simple trephining had no appreciable effect on the condition.

#### SMALL-POX AND INSANITY IN HALIFAX: EMBARRASSMENT OF AUTHORITIES.

It is difficult to say whether acute insanity in a hospital or small-pox in a lunatic asylum is worse placed. But this is the choice of evils at present before the authorities of Halifax, or rather before the unfortunate patients who are affected respectively with these dire maladies. There are said to be over twenty small-pox patients in the borough hospital, which is already over-full. It contains, among other cases, twelve acute cases of insanity. Some of these have been certified and sent to one or other of the asylums of the West Riding. But the authorities of the asylum have refused to receive them in consequence of the existence of small-pox in the hospital. It would be interesting to know how far they are acting legally in refusing admission to duly certified cases on this ground. One remedy is obvious—the free revaccination of exposed patients and attendants. This, with an isolation ward for any doubtful cases, would remove all difficulty.

#### THE RETURN OF HYDROPHOBIA.

NEARLY two years have elapsed since the discontinuance of the muzzling order within the metropolitan district in favour of a system of registration. During this period no fresh outbreak of hydrophobia has occurred to suggest the necessity of returning to the former method of prevention. Quite recently, however, a fatal case occurred in Twickenham. Two others have been reported from Saltash, and have naturally given rise to some uneasiness in that district. It is satisfactory to note that the local authorities have acted in this instance with commendable wisdom and energy, and that muzzling has been enforced throughout a considerable area. We may therefore hope that the disease will spread no further. At the same time we must not forget that this desirable result can only be looked for if the sole preventive method of proved efficiency, the use of the muzzle, be maintained for some weeks at least in full operation. The experience of Saltash, moreover, is instructive, inasmuch as it reminds us how hydrophobia, even when it has been apparently stamped out, is apt to reassert its vitality by appearing in an outlying district which was previously as free from taint as from preventive supervision. The implied warning should not be lost on local authorities elsewhere, who may be disposed to trust in an imaginary immunity, and it cannot be doubted that if the use of the muzzle were generally insisted on we should practically abolish a disease which is the essential counterpart of canine vagrancy. While according a due preference however to such obvious measures of prevention, we have also to remember that the principle which underlies them has now, thanks to M. Pasteur, a very real importance in relation to curative treatment. Not one of the fatal cases already mentioned appears to have attracted notice till near its termination. We would therefore the more earnestly impress upon any persons, and

especially upon practitioners who may be called upon to deal with injuries of this kind, the necessity of obtaining at the earliest moment, and if needful through local authorities, the opportunity of inoculation. According to a recent report by Dr. Dujardin-Beaumetz, which will be found in our Paris correspondence, the death-rate from rabies, which at one time was 15 per cent., has by the Pasteur process been reduced to 0.88 per cent.

#### OFFICIAL ACTION AS TO CHOLERA.

WE understand that Mr. Fowler, President of the Local Government Board, on being apprised of the attack of cholera at Hamburg and other western ports of Europe, immediately returned to London, and at a late hour on Wednesday evening conferred at Whitehall with Sir Hugh Owen, K.C.B., Dr. Thorne Thorne, C.B., and Dr. Bridges on the measures which were being adopted and which should be set on foot in the metropolis and at our eastern ports. In 1884 the Metropolitan Asylums Board undertook to make the first provision for isolating cholera in London, and they probably will, as on that occasion, again arrange with the managers of hospitals, workhouse infirmaries and similar institutions so as to meet any emergency that may arise.

#### GEOLOGY AND DISEASE.

THE conference of scientific societies at Inverness a few days ago seems to have met with a large measure of success. Nine societies were represented at this gathering, and various communications, more than one of them of considerable value, were brought under the notice of the assembled representatives. Some of the papers were of an antiquarian nature, and therefore not of special interest to medical readers; others, again, dealt with geological and botanical subjects. But the paper of most value from our point of view was that of Mr. Alfred Haviland on the "Influence of the Geology and Configuration of a Country on Health and Disease." This paper, which we regret our space will not allow us to notice more at length, was illustrated by large coloured maps to show the regions where certain diseases chiefly prevailed. The subject is of undoubted importance, and though it has not been lost sight of by other medical writers, yet it has received special attention at the hands of Mr. Haviland, whose researches on the peculiarities of diverse parts of the earth's surface, and the atmospheric conditions incident to particular localities, have been of good service.

#### THE DANGER OF FLATS.

ONE of the difficulties connected with our big cities is the price of land, and the consequence of this is that we are crowding together a number of houses and dwellings on a very limited area of ground. In addition to this it is a "fashion" of the present day to occupy flats in some one or other of the big mansions that have been erected in various parts, in imitation of the monster hotels of London and other large towns. This life in community is considered cheaper and more independent; fewer servants are required, and the flat or suite of rooms can be locked up and the key deposited with the porter from time to time during the temporary absence of the occupants whenever they may desire to be away. Still this system is not without its disadvantages, hygienic and otherwise, as well as its inconveniences, to say nothing of its possible dangers. In the first place, in many of these flats everything is sacrificed to their so-called reception rooms. There is a dining room large enough for twelve or twenty guests, with a kitchen and scullery accommodation that would not suffice to cook and prepare the food for half a dozen. Then the servants' accommodation is frequently of such a cramped and unsatisfactory character that it is a wonder that servants—whose tastes and

requirements nowadays are often fastidious and somewhat exacting—are willing to live in the apartments appropriated to their use. They are generally dark and placed at the back, without any look-out beyond a blank wall, another block of flats, or the gable end of some building. But from a hygienic point of view, can anything be worse than a mansion of flats where each floor ventilates into those above and below, and the lifts, or, as the Americans call them, the elevators, pump the air from one floor to the other as they go up and down just as if they were designed for the purpose? The separate families living on the different flats form a community under one and the same roof, with a common atmosphere and a common funnel for the circulation of that atmosphere, without any renewal from without, from one flat to the other. A recent catastrophe has demonstrated the danger of this state of things in the case of fire, and it has served at the same time to indicate what might very possibly happen in case of an outbreak of infectious disease. This might spread, like a fire, from one tier to the other by means of the lift, with the same facility as a visitor would make a call, or a portmanteau be transported from the first to the fifteenth floor, by that channel of intercommunication—the lift!

#### SEATS FOR EMPLOYÉS.

No less rational in our opinion than it is just and humane is a practice which is happily gaining favour with employers—namely, that of providing seats for those of their assistants not actually engaged in serving the public. Some shops are blessed with this privilege, and so also of late have been the vehicles of the Road Car Company. We have always maintained the cause of the employed in both cases. It is easy, of course, to understand the objections which might be urged by its opponents against this course. They would say that there are either no such intermissions of work as would permit of sitting down, or that there ought to be none if the employé were sufficiently alert in seeking and using opportunities of service. It must, however, be apparent to everyone that intermissions, though they may be short, do occur, and that frequently. Besides, a conductor may be so placed that he can easily command a view of the whole thoroughfare beside and behind his car. A revolving seat would afford him all needful rest in his momentary intervals of quiet, while affording also every facility for vigilance. The same argument applies with greater force to shop labour. Here women are largely employed. Some relief from the constant strain of standing or walking to and fro is a mere physical necessity, especially during women's occasional periods of malaise. We fail to see therefore why a reasonable concession to this obvious necessity should not rather help than hinder the success of their efforts.

#### MISSED BIRTH IN ANIMALS.

At a recent meeting of the Yorkshire Veterinary Medical Association a case of missed birth in a mare was introduced by one of the members, the history of which is interesting, as the animal had been under observation during the whole time the fœtus was retained, and the period of retention could therefore be fixed. Six years ago the mare was in foal, but owing to having eaten too much rye (which might have had a toxic effect on the fœtus) she had a serious attack of indigestion, for which she required medical treatment. This was near her time for foaling, and the fœtus was then alive, as its movements were noticed externally for three days, when they ceased. She was unwell for some months and lost condition; but at no time were there any indications of approaching parturition. Eventually she recovered and was put to work, at which she continued

until last June, when she succumbed to strangulation of the intestines. On examination of the uterus the walls of this organ were found to be fully two inches thick, and in its cavity were the remains of the fœtus in a mummified condition, all the soft tissues having disappeared except some portions of the skin and its appendages, hair and hoofs and tendons. At the meeting much astonishment was expressed at the description of the case, as well as doubt, and the term "marvellous" was applied to it. But instances of missed birth are not so very rare in the domesticated animals, and they have been even recorded as occurring in those which are not domesticated. Had the members referred to Fleming's "Veterinary Obstetrics," a work specially dealing with the subject of gestation and parturition in the domesticated mammals, they would have found ample reference to this subject as well as a number of illustrative cases. We propose to deal more fully with the relations of this case to human obstetrics in an early issue.

#### PUBLIC VACCINATION AND SMALL-POX.

THE question raised by Mr. Horder in our issue of August 6th is one of the greatest importance. In reference to this matter we have received a communication from a gentleman who is one of the most determined opponents of vaccination, and it would be easy to apply to him and his followers the deprecating phrase in which he refers to people talking on vaccination as they wish to find the facts. His argument may be summarised as follows: (1) Small-pox mostly prevails among the poor; (2) the poor are mostly vaccinated by public vaccinators; therefore (3) there is more small-pox amongst those who undergo the operation at vaccination stations than at the hands of the private practitioner. May we venture to present him with another syllogism. (1) Small-pox prevails least among the "better-off" classes; (2) revaccinations are more common among these classes; therefore (3) the paucity of small-pox cases depends on the greater protection afforded by revaccination. When consideration is given to the greater facility existing for the spread of the disease in crowded dwellings we cannot be surprised at its extension amongst the class who live under the "worst conditions." Finally, as regards the alleged superiority of "public" vaccination over "private" vaccination, it may be stated in general terms that the regulations under which the public vaccinator acts are such as to produce that degree of vaccination (as regards quality and character) which has been proved to be most protective against or, if that phrase be objected to, most efficient in mitigating the severity of small-pox. Whereas the private practitioner not being controlled by such rules may certify as "successful" a single insertion followed by a vesicle. Of course there are numbers of practitioners who carry out vaccination in private practice as efficiently as it is done at the vaccination stations; but we venture to think that much of the discredit of vaccination and many of its accidents are due to irregular and careless practice.

#### TRAUMATIC TETANUS AND ZINC SALTS.

A CASE of some interest is published in a recent number of the *Australasian Medical Gazette* by Dr. J. Sidney Hunt of Queensland. The case was one of traumatic tetanus, arising after amputation of a foot on account of a compound comminuted fracture of the fibula, which, owing to the long time which elapsed between the accident and the time of admission, had given rise to a putrid and very offensive condition at the seat of injury. The first symptom of anything serious occurred on the fifth day after the accident, when the patient complained that his teeth were tender—a condition which he ascribed to his clenching them too tightly during

sleep. Two days later there was manifest rigidity of the muscles of the jaw, and this was quickly followed by very severe general tetanus. The treatment of the case is the most interesting part of it. Dr. Hunt has had favourable experience of the usefulness of zinc salts in chorea, which he believes to be due to some morbid condition in the basal ganglia. Similarly, he suggests that tetanus may be due to a paralysis of a moto-inhibitory mechanism in the same ganglia and he conceived that similar treatment might be efficacious. Accordingly, sulphate of zinc was administered in steadily increasing doses, until as much as two scruples were being given every six hours. There was no vomiting or other inconvenience and nothing unusual was noticed except a certain amount of anemia. Opium was also used very freely by the mouth. Under this treatment the patient recovered, but it should be mentioned that antiseptic dressings and irrigation were assiduously used to the stump in which the mischief started. The case is very interesting and we congratulate Dr. Hunt on the result. Whether its favourable result was due to the zinc or the opium or the attention which was given to the stump it is difficult to say, and Dr. Hunt is not dogmatic on the subject. It is not easy to apportion to each means its share in the result, but it is at least significant that the zinc salt, even in the large doses in which it was given, failed to produce the nauseating effects which are usually expected from it, and its apparent efficacy in one case of a grave and usually fatal condition should not be lost sight of in the treatment of similar cases in the future.

#### THE SPECIAL TRAINING OF NURSES FOR CHOLERA.

THERE can be no doubt that, whether we in England do or do not escape from a visitation of cholera during the present epidemic, we must leave nothing undone to ensure our being ready to meet and to deal with the disease should it invade our shores. Of hospital accommodation, so far, at all events, as the London district is concerned, we shall probably have enough for the pressing needs of the population which would quickly follow upon an outbreak of cholera in the metropolis. However, it is not improbable that unless we at once set to work to prevent such an event we may suddenly find ourselves with cholera in our midst and a pressing want of nurses properly trained to meet the emergency. Were this to happen we should only have ourselves to blame, for both the nurses and the teachers required to train them are to be had in sufficient numbers if only pressure is applied in the right way and in the right quarters. It does not appear reasonable to pause in a time of danger, to consider seriously whether cholera spreads by means of human intercourse. It is practically admitted on all hands that it is chiefly by this means that cholera is now spreading over Europe and Asia. Without, however, going into matters controversial in nature, we desire to point out the urgent need there is for the prompt and thorough training of nurses in sufficient numbers to meet any emergency which might be caused by a sudden outburst of this plague in England. It is not necessary for us to point out that it is in dealing with sporadic cases of cholera that the greatest care is required; and it is not unreasonable to teach that by proper attention to the first victims of the disease an outbreak of it in epidemic form might be altogether prevented. It is absolutely certain that efficient medical men and trained nurses are both necessary for this purpose. We are strongly of opinion that classes should at once be opened for the teaching of nurses already trained in ordinary work for the special work which they would be called upon to do were cholera to come upon us. This special training of nurses should be confined to men who have themselves had practical experience of cholera, and who have shown by their published

work that they have given thought to what should be done to prevent, if possible, the spread of that disease in a community, and in any event to limit to the utmost its ravages. If full benefit is to be secured from the provision we have suggested, it cannot be too earnestly insisted on that the plan must be carried out immediately. Should we happily, as was our good fortune during the last European epidemic, escape a visitation of cholera, no harm will have been done by our taking all necessary steps to meet any emergency.

#### "CURES" FOR INEBRIETY.

IT may interest our readers to know that Dr. Keesley has issued a writ against the Editors of THE LANCET, claiming damages for libel. Our solicitors have of course accepted service of the process.

#### EARTHWORMS AS CARRIERS OF INFECTIVE GERMS.

TUBERCULOSIS may be diffused in many ways, as bacteriological research is constantly reminding us. Its bacilli may be stored and spread by subsoil worms, according to a series of experimental studies lately completed by MM. Lortet and Despeignes. These worms, for several months and in various parts of their organism, can preserve the bacilli in question and reconvey them to the surface of the ground. Early in their researches MM. Lortet and Despeignes were confronted with the objection that in garden soils, in which worms abound, the bacilli of septicæmia, great in number and in activity, are also met with—bacilli which, on experiment by inoculation, are capable of developing fatal disease, prior to the tuberculous process. This objection, however, they were able to dispose of by having recourse to a dry, silicious earth passed through a fine sieve, in which bacilli are not to be found; while their next step was to place the tuberculous substance at the bottom of vases filled with this earth, on the surface of which they sprinkled a layer of white and very pure sand; and finally, they covered everything with a sheet of paper. After a few days the worms which were concealed in the earth at the bottom of these vases came up and deposited their intestinal evacuations on the sand—evacuations which MM. Lortet and Despeignes succeeded in collecting without risk of contamination, and in finally inoculating in a number of guinea-pigs. In consequence of these inoculations there was developed in the guinea-pigs a generally diffused, very distinctly marked tuberculosis. The experiment, far from a complex one, was successful in demonstrating that earthworms can reconvey to the surface of the soil not only the products of their digestion, but also together with these, the bacilli of tuberculosis in full possession of their infective virulence. A similar fact, it will be remembered, was established by M. Pasteur in his bacteriological studies on charbon. For this latter disease, therefore, and in no less degree for that of tuberculosis, it is conclusively indicated that their infective débris should not be consigned to the subsoil without complete destruction of their germs. Unless this destroying process has been practised such débris may be seized upon by earthworms stored in their organisms and reconveyed to the surface, to become again the source of a new contagion.

#### FOREIGN UNIVERSITY INTELLIGENCE.

*Chicago (Rush Medical College).*—Dr. A. C. Cotton has been appointed to the Professorship of the Diseases of Children.

*Florence.*—Professor P. Grocco of Pisa has been appointed Professor of Clinical Medicine.

*Gratz.*—Dr. Carl von Rokitansky of Vienna has been appointed to the chair of Midwifery and Gynecology.

*Königsberg.*—Dr. Kuhnt of Jena has been appointed to the chair of Ophthalmology.

*Lille.*—Dr. Doumer has been appointed to the chair of Physics.

*Munich.*—Dr. H. Rieder has been recognised as *Privat-docent* in Medicine.

#### DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Dr. Bechet, Honorary Professor in the Nancy Faculty of Medicine.—Dr. Dahnhardt, *Privat-docent* in Neurology in the University of Kiel.—Dr. B. W. MacCreedy, Professor of Therapeutics in the Bellevue Hospital Medical College, New York.

THE danger attending the indiscriminate and immoderate use of ice-creams was illustrated a day or two ago in the case of a boy whose death formed the subject of an inquest held at the Islington Coroner's Court. The medical evidence showed conclusively that the cause of death was peritonitis, and the coroner, in his comments on this case, suggested that some systematic inspection should be made of the places where ice-creams are manufactured. This subject, we may remind our readers, has not been overlooked by us in the reports on various articles of food which have appeared from time to time in our columns; and it may be well therefore to draw attention to the report on this particular article of diet as published in THE LANCET of Oct. 18th, 1879, and some remarks on the same subject to be found on Sept. 1st, 1888.

Mrs. MARGARET ANNE NEVE was born on May 18th, 1792, and was married in 1823 at Rouge Huis, Guernsey, to Mr. John Neve of Tenterden, Kent, who died in 1849. She has travelled much, having visited every country in Europe save Portugal. She is now in good health, hears well, and sees well even without glasses; she has neither ache nor pain, and walks to church and to market. Her mother lived ninety-eight years and a half, showing the element of heredity as so many long livers do. Mrs. Neve's habits have been always simple and temperate, but not those of total abstinence.

THE QUEEN has been pleased to confer on the Right Hon. Sir Lyon Playfair, K.C.B., the dignity of a Baron of the United Kingdom. The son and brother of medical men, and occupying for many years a prominent position as a teacher of one of the collateral sciences of medicine, Baron Playfair has our sincere congratulations on receiving such a mark of honour.

THE members of the medical profession will receive with lively satisfaction the announcement of the appointment to a seat in the Privy Council of Professor Huxley. Such a recognition of the claims of medicine is the more acceptable as the opportunity of recording such an appointment is comparatively rare.

AT an extraordinary general meeting of the British Medical Association, held on the 24th inst. at the offices of the Association, the resolution passed by the general meeting at Nottingham altering the by-law and admitting women to be members of the Association was confirmed by a large majority.

AT a meeting of the Court of Examiners of the Society of Apothecaries of London, held at the Hall on Thursday, Aug. 18th, Dr. Thorowgood in the chair, a presentation of plate was made to Dr. J. Sherwood Stocker on his resignation of the chairmanship of the court

THE advent to St. Petersburg of Professor Virchow, who has arrived from Moscow to attend the Anthropological Congress, elicited marked manifestation of enthusiasm on the part of *savants* at the Russian capital. A large number of physicians and members of scientific societies greeted his arrival and made elaborate preparations to secure the comfort of their illustrious guest, in whose honour it is proposed to give a banquet at an early opportunity.

THE medical department of the Privy Council has issued an order to registrars of death requiring them before registration to make special inquiry as to whether the person who attended the deceased before death was qualified or not.

#### BRITISH INSTITUTE OF PUBLIC HEALTH: MEETING AT DUBLIN.

ON Wednesday, the 17th inst., the proceedings of the Sanitary Congress commenced at the College of Surgeons under the presidency of Sir C. Cameron. Dr. Haughton, Sir John Banks, K.C.B., Dr. Grimshaw (Registrar-General for Ireland), the Right Hon. the Earl of Meath and Sir F. Maccabe were elected honorary Fellows of the Institute. Professor A. Roche was made a member, and Mr. O'Meara (medical officer of health, Carlow), Mr. T. W. Berry, C.E. (Kingstown) and Mr. W. R. Graves (Dublin) were admitted associates. At half-past ten Sir Charles Cameron held a reception, and at eleven o'clock the proceedings of the Congress were entered upon.

Sir CHARLES CAMERON, in his opening address, said his first duty was to introduce the British Institute to the city of Dublin, and in doing so it would be necessary to give a short biographical sketch of both. During the few years that the society, under various names, had been in existence he ventured to claim for it that it had done good and substantial work. To a great extent it was mainly through the instrumentality and the exertions of the society that the qualifications in public health and in sanitary science were made registrable qualifications, for which diplomas or degrees were issued by the various universities and medical corporations. Lengthened correspondence and interviews had taken place between the persons connected with the introduction of the last Medical Act and the institute, and the result was that the qualification in public health and state medicine now shared with those of the great departments of the healing art the honour of being the subject of special registrable qualifications. It was also to a large extent due to the exertions of this society that a rule had been made by which during this year and the succeeding years no one could be a health officer of any town of 50,000 inhabitants or upwards who was not possessed of a registrable qualification in public health. He thought that they in Dublin ought to be proud that the first qualification of this kind made before it was a registrable one was due to the University of that city, one of whose greatest ornaments—Dr. Haughton—he was sure they were all glad to see amongst them that day. He might also claim for the institution in whose building they were assembled that it was the first in Europe to establish a chair of Hygiene. However, although the institute had done much good work in the past, it had still some important work before it, and he was happy to say it was steadily increasing the number of its members. There was a general idea that Dublin was situated under peculiarly happy circumstances in reference to health. No doubt the environs of the city could hardly be surpassed by any other, but the city itself was not so happily circumstanced. Dublin had been well described on one occasion by Dr. Haughton as "a waterlogged city situated in a mud valley," and he thought it a very accurate description. The average death-rate in the Dublin metropolitan area in the period 1876 to 1880 was 31.76 per 1000—an enormous rate. In the city the rate was 34.11 per 1000 and in the suburbs 23.39. During the period 1881 to 1885 the death-rate in the whole registration area was 27.32, in the city 30.34 and in the suburbs 19.68. In the period 1886 to 1890 the death-rate in the whole area was 26.3; in the city, 28.86;

and in the suburbs, 19.86. The effects of sanitary improvements were not immediate. It took a long time to undo the influence of over-crowded dwellings, want of proper drainage and other insanitary conditions in the health of towns. In the period 1876 to 1880 the death-rate from the principal zymotic diseases in the whole registration area was 5.29 per 1000—the rate in the city being 5.83, and in the suburbs 3.27. In the next period, 1881 to 1886, the rate in the whole area was 3.06, in the city 3.42, and in the suburbs 2.16. In the period 1886 to 1890 the death-rate in the whole area was 2.87—in the city 3.2, and in the suburbs 2.02. Last year was registered the lowest death-rate for zymotic diseases in the city. It was only 1.7, and when it was considered that in 1879-80 and in 1881 it was 7 or 8 per 1000, he thought it might fairly be claimed that Dublin had made progress with regard to preventable diseases. The subject of typhoid fever was of great interest to Dublin on account of the fact that while all other zymotic diseases had been steadily decreasing typhoid fever had not only not decreased, but had actually increased. It was found, however, that this was not the case with regard to most of the towns of the United Kingdom. Sir Charles Cameron had put himself in communication with fifty of the medical officers of health of the principal towns in England, and he had found that the mean annual death-rate in those fifty towns for the last five years from typhoid fever was 3.2 per 10,000. The rate in the different towns varied considerably—from 0.7 per 10,000 to 5.2 per 10,000. Why did typhoid fever exist so much in Dublin and increase instead of decrease? Was it because the water system was bad or the drains and sanitary accommodation worse than in other towns? He really did not think it was. He knew it was a fashionable thing when a typhoid fever case occurred to attribute it to polluted water or defective drainage; but the history of typhoid fever in Dublin showed there must be other causes at work. The sanitary accommodation of the houses might be defective, but it was defective everywhere, and that was not sufficient, he thought, to account for the fact that the death-rate from typhoid fever was seven or eight times as great as it was in many of the English towns, which he knew from his own personal experience could not compare in point of public sanitation with the city of Dublin. There must be some other cause, and his theory was that it depended on the sewage-saturated condition of the soil itself. He had come to the conclusion, after carefully thinking over the matter, that at all events in investigating the phenomena of typhoid fever in Dublin it must be agreed that it was of a miasmatic character—that it was malarious and that the germs rise out of the soil. There were some very poor places situate on the gravel soil that had very little typhoid fever no doubt, but there was the geological fact that the chances were 50 per cent. greater of getting typhoid fever on the gravel soils than on the clay, and the cause of that was that it was easier to dry up the superficial layers of clay on the gravels. He did not think it was possible to eliminate the germs from a perfectly wet surface, because they would not go out of the water save under very exceptional circumstances. Therefore, in those clay places the micro-organisms could not be disengaged, but there were terrific currents of underground air which must come up, and often with great force; and when the soil was sufficiently dry to enable these micro-organisms to be disengaged or detached they came up into the atmosphere, and his conviction was that in the very streets of Dublin it was quite possible to get typhoid fever. The soil of Dublin had been polluted by a system of storing up human excreta for centuries, the result of which was that in the low-lying soil, badly drained as it was, enormous accumulations of animal matter of an organic character had occurred. In the great cities of America malaria was disappearing with the advance of population, but it was rapidly being replaced by typhoid fever; and as the ground was being saturated with organic matter of the animal kingdom it was found that typhoid fever prevailed and had become one of the dangers of the population of the United States.

#### *Discussion on the Etiology of Typhoid Fever.*

Mr. GRAVES dealt with the principal media of conveyance of typhoid fever in Dublin—defiled water, air polluted by exhalation from foul and unventilated sewers, ground air from a silt-saturated soil, contaminated milk, food and bed-linen. He thought that the introduction of the Varty water ruined the drainage of Dublin, for simultaneously with the turning on of the water the inhabitants and manufacturers ceased to pump the water out of the ground. The three prin-

cipal factors in keeping up the death-rate from typhoid fever in Dublin were, he believed, defective and leaking drains in sewers, and stagnant and unused polluted wells, whence high-level polluted subsoil water, the result of the two first named causes.

Dr. F. J. ALLAN believed that Sir Charles Cameron's theory was one which should be looked upon as correct. He was surprised that the suburbs did not coöperate with the city in regard to the main drainage.

Dr. MAGENNIS said they should insist, as far as lay in their power, on the sterilisation of milk. It was a very frequent source of conveying contagion.

#### *Bacillus Typhosus.*

Dr. McWEENEY read a paper on this subject and discussed the view put forward by Professor Arloing that there is no special microbe of typhoid fever, but that certain organisms inhabiting the body are capable of assuming disease-producing properties and may cause typhoid fever. Dr. McWeeney drew attention to the fact that exposure to strong sunlight was not fatal to all kinds of bacilli, and that this fact was of great importance in its application.

#### *Cholera.*

Dr. HAUGHTON submitted that cholera patients ought to be admitted to the general hospitals instead of being placed in special cholera hospitals.

Dr. LITTLEJOHN was of opinion that there would be a general stampede from the general hospitals if cholera patients were taken there.

Dr. POTTER (Indian Army) said that his experience in India showed that cases of cholera ought invariably to be isolated, and every arrangement ought to be made to protect the medical officers and the attendants from the disease.

Dr. MAJOR GREENWOOD said that there was a considerable agitation at present in London with regard to a better water-supply. The present was a good time for pressing the matter forward. In London the water-supply was worse than that of Edinburgh, and if cholera came to-morrow it would cause great ravages.

Professor SMITH said that from his own knowledge he was sure that the sanitary arrangements of the metropolitan area of London were thoroughly efficient; attention was now being directed to the water-supply, and so far it had been found that the case against it was exceedingly weak; he did not think that the people of London had really anything to fear from their water-supply in the case of an invasion of cholera.

Sir CHARLES CAMERON, in closing the discussion, said the death-rate of England had remained stationary until the passing of the Public Health Act of 1866, which was followed by the vastly more important Act of 1875, in which the change of the word "may" into "shall" was followed by the most beneficial results. It was far better to use the staffs of the different great hospitals of the city. Dublin was the most hospitalised—and he hoped the most hospitable—city in the world, containing 40 per cent. of the hospital beds of the country, and it would be far better to use these hospitals than to put up sheds. If there were no objection to admitting cases of typhoid fever to the infectious wards of hospitals, there could be no objection to admitting cholera cases. In response to a circular which he had sent round to the hospitals, he had ascertained that if cholera came on the morrow hospital accommodation could be provided for between 400 and 500 patients, and there was a ship near the mouth of the river in excellent order, with accommodation for twelve patients, which could be used for cases on board boats entering the harbour.

#### *Registration of Plumbers.*

Dr. LITTLEJOHN moved a resolution approving of the national registration of plumbers, and in the course of his remarks said that plumbing in Scotland was superior to that in England, and one result of national registration would be to raise the standard of plumbing in the latter country.

Dr. ALLAN seconded the resolution, which was carried.

#### *Influenza of Sewage on Milk Cows.*

Mr. J. BYRNE POWER read a paper on this subject, in which he contended that cows, like human beings, might become diseased by drinking impure water, and, being diseased, might be capable of disseminating it through their milk.

THURSDAY, AUG. 18TH.

*Sanitary Legislation.*

Dr. MAJOR GREENWOOD read a paper on this subject. He traced the progress of sanitary legislation from the time of James I., and said that one great mistake of sanitary legislation was that too frequently the powers for carrying out the provisions of the Act were placed in the wrong hands; the enforcers of the law were those most interested in maintaining the abuses of the law which it was intended to redress. In many cases action could only be taken by the local sanitary authority, and when it was considered that the authority was not infrequently made up of those to whom the enforcement of the law would mean a considerable pecuniary loss, they could hardly be surprised at the lack of energy so frequently shown in administering those laws, or at the unpopularity incurred by a too active medical officer of health who allowed his zeal to outrun his discretion.

Dr. LITTLEJOHN (Edinburgh) moved the following resolution:—"That, as the outcome of these admirable papers, this institute should desire to express their unanimous opinion that the time has now arrived when a responsible minister of public health should be appointed, and that the General Health Acts of the country should be consolidated and administered by a responsible central authority; and finally, that a thorough sanitary survey of the kingdom should be instituted."

Professor SMITH seconded the resolution, which was adopted.

*The Notification of Infectious Diseases.*

At 2.30 the Congress reassembled.

Professor SMITH (London) opened a discussion on this subject. He observed that Parliamentary legislation of recent years on this subject was remarkable. The Act of 1889 made it compulsory on all medical practitioners and heads of families to notify the occurrence of all infectious cases coming within their knowledge. No one would dispute the importance of that Act. At present the responsibility of the notification rested with the head of the family and the medical practitioner, but he was of opinion that the Act would require amendment, inasmuch as in some cases the parents did not consider it necessary to call in a doctor in cases of measles, and in those cases it should be made compulsory to notify the occurrence of the disease.

A resolution in favour of including measles in the list of diseases to be compulsorily notified was adopted.

Dr. C. R. TICHBORN read a paper on the Sulphite of Zinc as a general Antiseptic in Typhoid Fever. Some years ago, he said, he introduced sulphite of zinc as an antiseptic for general use, and a few years since he and Dr. F. Heuston had applied this salt to fabrics for antiseptic dressings with marked success, as it could be deposited in the fibre of the material in a semi-insoluble condition. Its action on wounds was marked, as possessing both the germicide action of zinc salts and the antiseptic action of the sulphites combined with the healing properties of oxide of zinc.

Sir CHARLES CAMERON read a paper, which was illustrated by experiments, on the Use of Carbonic Acid Snow as an Antiseptic.

Mr. R. HAMMOND addressed the Congress on the sanitary advantages of the Electric Light, and after a vote of thanks to various bodies the proceedings terminated.

---

## THE ETIOLOGY OF TETANUS.

A CASE of traumatic tetanus which has recently occurred at Blackmore, in Essex, and has been made the subject of a coroner's inquest, presents features of considerable professional interest and importance. On Monday, July 4th, a lad named W. H. Thomas, nine years of age, whilst at work on a farm, had his right foot trodden on by a horse. There was a slit in the boot across the toes at the time of the accident, which resulted in avulsion of the nail of the great toe and some little effusion of blood. After the housekeeper of the farmer for whom the lad was working had dressed the foot he walked home. For a few days the toe was dressed with Friar's balsam and subsequently with some "healing ointment" made by a woman in the village. The lad was at school on Sunday, the 10th, on Monday, the 11th, and on Wednesday and Thursday, the 13th and 14th. At half-past

seven on the morning of Thursday, the 14th, he complained of feeling ill. He had a very stiff neck, a strange look and said that he was sore and ached about his shoulders, face and head. He attributed his illness to a beating which he said he had received from the schoolmaster on the Wednesday because his father had kept him away from school. On this matter and on the reason for the caning there was a conflict of testimony. The lad's brother and one or two other boys stated that on the Wednesday the lad was caned by the schoolmaster, who also took hold of his chin and hit his head on the desk, whilst two other boys deposed that the thrashing took place on Thursday. On the other hand, the assistant mistress, who was present during the whole day, the schoolmaster himself and several pupils averred that the boy had never been caned at all. The mother never examined her son's back or asked the doctor to look at it, and no one during life saw any mark either upon the head or the chin. On the evening of the 14th Mrs. Thomas took her son in a cart to see Dr. White of Kelvedon Hatch. The toe had then nearly healed. Dr. White said the boy was suffering from lockjaw, which might be dangerous, prescribed for him, and directed him to be taken home and kept in bed. He attended him until his death, which took place on Sunday, July 31st. During his illness the boy complained frequently of pain in the right leg and found considerable relief when the leg was rubbed. The inquest was opened by Mr. J. C. Lewis, the coroner, at the "Leather Bottle Inn," Blackmore, on Wednesday, Aug. 3rd, and was adjourned till the following day when by the coroner's order Dr. White made a post-mortem examination. Externally the only mark found by Dr. White was a severe bruise running across the chin for three or four inches, and this bruise was seen subsequently by the jury. A new nail was partially formed on the big toe of the right foot, but some discolouration remained. The organs generally were healthy, including the brain, but there was a considerable amount of venous congestion, with serous effusion on the surface and base of the brain. When asked at the adjourned inquest his opinion as to the cause of the tetanus Dr. White said: "Taking the bruise on the jaw into consideration, and assuming there was injury to the side of the head caused by a blow, he could see no other way to account for the tetanus than to say that that was the cause of death, and in his opinion the injury to the toe had nothing to do with the tetanus." At this stage in the inquiry the coroner adjourned the inquest to the 22nd instant, with the express purpose of having the medical evidence fully weighed and considered, and the solicitor, Mr. H. W. Gibson, of Ongar, who appeared on behalf of the schoolmaster, acting on instructions from the National Teachers' Union, asked Mr. Rivington and Mr. Bland Sutton to give evidence when the inquest was resumed, a full report of the evidence having been placed in their hands. Mr. Rivington said that in his opinion the cause of the tetanus was the injury to the right toe caused by the horse treading upon it on July 4th. With the exception of one or two cases of tetanus arising without any evident cause, or idiopathic cases, in all the cases of tetanus which he had seen there had been a wound. He had never seen tetanus arise after a simple bruise or a simple fracture, or from a fall or a blow. A few cases of the kind were recorded in medical works, some being cases reported a good many years back. But he regarded these cases with a good deal of doubt. Very slight wounds might be followed by tetanus—slight scratches, if made with a dirty stick, rusty nails running into the foot, &c.—but a wound of some kind was generally a necessary condition. Tetanus often arose from earth getting into wounds or from wounds in a foul condition. In the present instance the interval between the injury to the toe and the onset of the symptoms was about the average interval for the onset of traumatic tetanus—nine or ten days. It might come on in three or four days, or after as many weeks. A splinter might enter the soft parts and remain imbedded for some weeks before tetanus supervened. He considered it in the highest degree improbable that tetanus could come on within twenty-four hours after an injury; and therefore, assuming that the schoolmaster had caned the boy and hit him on the head or struck his chin upon the desk, these injuries would not account for the tetanus. From the evidence it seemed to him that the tetanus had commenced before the alleged caning; and as no one, not even the medical attendant, had seen the large bruise on the chin during life, it was probably due to post-mortem staining from some cause acting after death. A bruise would not come out after death more than a fortnight subsequently to the infliction of an injury, no sign of the

injury having appeared during life. The cause of tetanus had now been demonstrated to be a poison produced through the agency of a micro-organism or microbe—a bacillus common both to man and the horse—and it took some days for the generation of the poison. This evidence was fully corroborated by Mr. Bland Sutton, who expressed his belief that it was impossible for a mere bruise to occasion tetanus. Mr. Lewis, the coroner, who gave careful attention to the medical aspects of the case, summed up the evidence in a very able and lucid manner, and the jury returned a verdict that the deceased had died from tetanus caused by the injury to the toe. Owing to the strong local feeling which had been aroused they were a good while deliberating. Had they attributed the tetanus to the blows said to have been inflicted by the schoolmaster, the coroner would have been obliged to commit the schoolmaster for manslaughter. This result would have been equally deplorable and oppressive; for as the injury to the toe was quite sufficient in itself to cause tetanus and the tetanus supervened after the regular average interval, and in accordance with the surgical experience available at the inquest, it would have been altogether wrong to have attributed it to injuries, not in themselves established, which have only here and there been set down by medical authorities as the sufficient cause of tetanus.

## CYCLING AND VITALITY.

### II.—ACCIDENTS.

It was not to be expected that our opening article on "Cycling and Vitality" would pass without challenge, and we were quite prepared to read the argument which every partisan invariably advances, whether he have evidence of its truth or not, that we were wanting in what is called practical knowledge of the art of cycling and the ways of cyclists. For the sake of cycling and of cyclists we wish it were the fact that our knowledge were not practical. Unfortunately it is founded on nothing but the practical. We know what cycling means in its outside working, but this is little compared with what we professionally know of it from those sufferers from the practice who do not tell always their most intimate friends the whole story of their cycling experience. Men who enter on cycling exercise find for a short time that it seems to give them a new kind of life. They have been confined to the counting-house, the place of business, or the study; they have, so to say, grown old in their pursuits, and parts of their nervous and muscular system are wearied with the monotony. This new exercise comes to them and all is changed. They discover, without understanding the reason, that they have muscular and nervous powers which have hitherto been concealed. They can cover as much ground in a week on the machine as they could previously cover in a year by their own muscular powers. Their eyes fall on new pastures, and their intellect is awakened to lessons read without books of which they have hitherto had no knowledge except at second hand, and then imperfectly. In addition, by reason of their fresh acquisition, they are brought into a new social life; they meet associates to them entirely new, some younger, some older than themselves, but all "full of cycling"; they learn from these new comrades the names and works of great riders—of one who has broken his own record by so many seconds in a race of over four hundred miles in twenty-four hours; of another, perhaps a lady, who has ridden a hundred and fifty miles between sunrise and sunset. These persons they find exalted into heroes and heroines of the wheel, and there is enkindled a spirit of competition oftentimes stronger than the intellectual spirit itself. Then comes the competitive effort. A book is obtained and kept, in which each day's work is recorded from the beginning of the year to the end. A man utterly unknown out of his own little circle suddenly becomes a man of mark to a new and wide circle. He has ridden, say, some thousands of miles in one year, or won a race, or made a great excursion; he is a man to know in the wide and ever-widening cycling world. Here are the inducements to hard cycling, new exercise of body, new exercise of mind and new competitive ambition. Far be it from us to say a word against any of these good things. We enter into them all, even in THE LANCET; we aim to make THE LANCET as varied as it

can be in its sphere, and we are ambitious that in its sphere it shall have no successful rival. We are therefore the last to find fault with work and competitive work even of a severe kind.

But what we find happens to the cyclist, and what we warn him against, is that he is apt to let the mere competitive effort take the place of everything else, so that at last he puts pace before peace and strives to conquer the element of time, against which the whole human family is struggling, with unequal odds. In every effort, intellectual or physical, the man who tries to conquer time, to do more within a given period than he has the natural capacity to perform, is beaten from the first, and in cycling that is the fatal strife. As a contemporary said a few weeks ago *à propos* of these remarks—"One can understand the insidious strength of the temptation to indulge overmuch in this fascinating form of exercise. But the greater the temptation the greater the need of prudence and self-restraint." We who look on as well as practise the exercise see the necessity for this advice with increasing evidence each month and year; it is day by day becoming more obvious, on the road, on the track, in the streets of the metropolis and other cities, that cycling is breaking its own record in evidence before the coroner, before the physician and surgeon, before the magistrate, before the world at large, cycling circles alone excepted.

We pointed out in our last article certain physical catastrophes from extreme competitive riding. We turn to-day, for a moment, to the great increase of accidents immediately occurring and often immediately fatal during the very act of riding. These increase daily, not from faults of the machines ridden—for, thanks to the skill, care and competency of the industry that turns out cycles, there is the most admirable safety work in this direction that ever was produced—but from the fault of the riders themselves; chiefly the fault of competition against other riders and against all sorts and conditions of travellers—travellers on horseback, in carriages, by omnibus, and on foot. Lookers-on say there is marvellous precision in riding in the crowded streets. They may well marvel; but in this regard success itself in meeting and evading obstacles does not mean winning; it means wear and tear of the constitution. Beyond anything that can be accredited when it is carefully observed. We have ourselves ridden under these trials, and we know the effects. During the feat the most active of the senses are strained to the utmost: the ear is strained to catch every voice and sound; the eye is strained to meet every danger as well as to avoid being a cause of danger to others; the sense of touch is equally strained; the mind and the body are at full strain and the muscular sense at its highest mark. So long as the tissues are young and elastic this feat is for a time possible, but it is doomed even in the young to early failure and it makes the young prematurely old. To the middle-aged, nay to those who are but just matured, the feat is dangerous, though a collision may never take place. There is the internal and the external strain; there is the after lassitude from what Dr. Kolb has ably described as "the nervous insufficiency" of fatigue; and there is the after waste of the nervous fever which follows the effort. Under these strains it is little wonder that riders die whilst riding without actual collision; little wonder that the papers should report how a well-known cyclist was found dead by the roadside with his machine beside him. Framed in a manner not calculated to bear these strains, though they be less severe than riding daily through a London thoroughfare, this gentleman, from nervous insufficiency, failed and succumbed under an exercise too too enthusiastic partisans of which say we have no right to criticise, albeit it is fatal to their best of comrades.

These are accidents without collision. To them must be added accidents with or during collision—accidents of two kinds when correctly defined. Some of them are purely accidental and unavoidable, such accidents as no skill and no presence of mind can meet. There are others due to the temporary absence of skill or presence of mind of the rider—failure, in fact, arising from the nervous exhaustion or nervous insufficiency referred to above. The best of riders may be placed *hors de combat* from this last-named cause; at a critical moment some movement he brings skillfully into play under ordinary circumstances fails of its purpose; a little water on the roadway makes his wheel skid—a lamentable and fatal instance of this sort occurred only last week in Kensington—or some similar mishap takes place; his skill is baffled, there is no time to rectify the mischance and all is over.

From such modes of accident, fatalities and injuries are largely on the increase. Our table is becoming crowded with reports of cycling calamities. In London the number of accidents from cycling, amounting to 36 in 1881, ran up to 360 in 1891. But from 1891 up to the present time the number has increased out of all previous proportion, and is so steadily increasing that there is no help for it but new legislation of a preventive character for the equal protection of the public and of cyclists themselves.

We have endeavoured to ascertain whether in cycling accidents the danger is greatest to the rider or to those with whom he comes in contact. On this question there is, we think, but one answer: the danger is chiefly to the cyclist—a fact which has been the real cause of delay in legislation. The cyclist, accepting all risks, does not ask to be protected by law. He pays the penalty severely enough, for, as a rule, they are no commonplace injuries to which he is subjected. A broken limb is a puny penalty. The rider once off his balance is indeed in a plight. His governing power is lost; if he be riding fast his reduction of speed, assuming that the break is under his control, must be effected in the most careful manner; in collision he has usually to meet a structure more massive and steadily resistant than his machine, while he, a part of the machine virtually, goes crash with it. The shock is general, and therefore so frequently fatal. It is of all shocks, save the crash of a railway collision, that in which the rider is most helpless as well as most imperilled.

## BURIAL AND CREMATION.

THE contest between earth and fire as the better mode of disposal of the dead still continues. Whilst it is very satisfactory to see public attention concentrated on what is one of the most important questions of the day, it is to be lamented that so much bitterness should be imported into the controversy, since the advocates of either mode have made out a very strong case. Those in favour of cremation maintain that by means of the furnace an adult human body can be reduced to ashes in the space of little more than one hour without the slightest offence to the living. They urge, moreover, that by their rules, in addition to the ordinary medical certificate of the cause of death and the registration thereof, they have an independent medical inquiry which so far has effectually safeguarded them from consigning to the crematorium the body of any victim of foul play. In addition to this rapid disposal of the dead body by fire and this safeguard from its possible abuse, they point with both force and reason to the comparative economy with which their mode may be adopted compared with that of burial. The crematorium does not occupy a large space and may be located in any existing cemetery. No purchase is required by the ratepayers of large portions of land at an enormous cost, nor is there any possibility of poisoning the adjacent water-supply. The value of these negative advantages cannot be overlooked, and it is not surprising that from their standpoint Sir Henry Thompson, Sir Spencer Wells and other advocates of cremation should regard with impatience the objections urged against it by the advocates of burial. The most formidable of these is the medico-legal one. In a recent case, still *sub judice*, the body of a female was exhumed some months after burial and strychnine was detected in the stomach and other viscera. The opponents of cremation naturally say that incineration would have destroyed all means of discovering the poison, and so would have tended to defeat the ends of justice. But the supporters of cremation might very fairly urge that in this case their independent inquiry might and most likely would have revealed the fact that the death took place under circumstances demanding an inquest, and that cremation would have been deferred till the coroner's order had been obtained. And while refraining from comment on a case which has still to be tried, it may be stated with perfect propriety that under the circumstances the case should have been reported to the coroner. Burial possesses the claims of greater antiquity, being so easy, so natural, so simple as almost to suggest itself, and it is a well-known fact that some of the lower animals and even insects have been observed to bury their dead with great care. Burial in the earth was termed by the heathens, being "restored to our mother's lap," or "covered with her skirt." To leave unburied the dead, even of

enemies on the battle-field, was considered dishonouring to the victors. Coming to the present times, our cemeteries are generally made attractive as recreation grounds, and as such constitute a great boon to the dwellers in large towns and cities. But only so if burial be what it ought to be—the restoration of the body to the earth whence it came, and the total abolition of all entombment in strong coffins, vaults, catacombs or walled graves. The truth is that Sir Henry Thompson and Mr. Seymour Haden are each of them, both personally and as the respective representatives of cremation and burial reform, very much in advance of the time. It is certainly better to be so than to be behind the time, but the former has the disadvantage of causing a distrust in the minds of those many persons who dislike violent changes from the old beaten track. Still both may take courage. Many persons of light and leading have expressed during life a wish that after death their bodies should be cremated, and this has been done, the number of cremations showing an annual increase, but still forming a very small proportion of the total number of deaths. On the other hand, burial reform advances slowly, but let us hope surely. The body of the late Lord Sherbrooke was buried in one of the perishable coffins of the kind variously termed "hardened" or "compressed" pulp, "earth to earth," or papier mâché. We have been informed (though we do not know if our information be correct) that the patent for these has lapsed and that they may be procured at a much lower cost. We hope that undertakers will also show themselves abreast of the times if not in advance of them, and afford the public every facility for burying their dead in these perishable coffins, leaving wood to be utilised by the living, it being useful to them and unsuitable for burial purposes. As has been previously suggested in these columns, burial and cremation may well be tried side by side for the present; their various advantages and drawbacks may be carefully studied, and a decision as to which is the better mode of disposal of the body may be given after a sufficient interval has elapsed. We see that his Holiness the Pope is about to publish an encyclical prohibiting to the faithful "that manner of burial which consists in burning the body." But there are many foreigners and others in this country to whom cremation is a matter of religion and sentiment as much as burial is to others. And as Englishmen have reasonable facilities afforded them in foreign countries for the burial of their dead, it is only right that we should afford the same facilities for the disposal of the body by burning to those who prefer it to burial. Everything in connexion with this subject points to the importance of simplicity in the matter of burial if the latter is to continue as the more general mode of disposal of the dead in this country. Medical practitioners know better than any other persons what occurs after death, and how important it is that the body should be really and truly buried out of sight. To pamper the body during life is foolish, but to attempt to preserve it after death deserves a much stronger expression. Why is it that the body should be so offensive after death? Surely to remind us of our mortality and to induce us to act rationally.

## IMPROVED FACILITIES FOR CONTINENTAL TRAVELLING.

### THE HARWICH ROUTE.

BELGIUM, Holland, the Rhine, Northern Germany and even Russia attract tourists, holiday folks and the invalid in search of health. Though the majority travel southwards to France, the Riviera, Spain, Italy, the Mediterranean and the East, still—and especially in the summer months—there are thousands who prefer or who select as a change more northern latitudes. Thus it is that the Harwich route has yearly become more and more frequented. The accommodation afforded to passengers is therefore a matter of public interest. This fact is eloquently set forth by the figures we have obtained concerning the increased traffic. The number of passengers conveyed by the Harwich route between that port, Antwerp and Rotterdam amounted to 50,582 in 1882, 53,803 in 1883, 55,590 in 1884, 68,807 in 1885, 68,111 in 1886, 70,400 in 1887, 75,723 in 1888, 79,421 in 1889, 84,740 in 1890 and 85,189 in 1891. Thus, in the

course of the last ten years, 692,366 persons have travelled by this route and the traffic has increased at the rate of more than one-third in the decade. This is but a just reward of the intelligent care taken of the comfort and safety of the passengers. A great deal had to be done to render this route attractive, for there is the insurmountable disadvantage of a long sea journey. Most persons prefer a somewhat longer journey by land if this ensures a much shorter sea passage. By Calais the passage can be effected in an hour and ten minutes, by Dover and Ostend in less than four hours, whereas the sea journey from Harwich to Antwerp takes at least seven hours. But the Great Eastern Railway Company has sought to overcome this disadvantage by supplying larger steamers and charging much cheaper rates. The journey by first class throughout, from London to Antwerp or Rotterdam, costs only £1 6s., and there is a service every day except Sundays. The train leaves Liverpool-street at 8 P.M. and reaches Parkeston Quay at 9.50 P.M. The time occupied in putting the luggage on board and the journey down the Stour, permit an opportunity for supper before reaching the open sea. Unlike the channel service, there is no difficulty about the insufficiency of water. Ships of any size may be employed, and thus can be used twin-screw steamers taking fifteen feet of water, whereas the screw steamer *Seine*, built for the Dieppe and Newhaven line, must not take more than nine feet of water and therefore cannot be steady at sea. From the very first, the company were able to build large and powerful vessels for the Harwich route. Their smallest ship, the *Peterboro'*, is 822 tons, and there are four paddle steamers varying in tonnage from 922 to 1049 tons. These are, however, the elder ships of the fleet; comfortable and well appointed, but not to be compared with the new twin-screw steamships, the *Norwich* and the *Ipswich*, of 1036 tons each, and the *Cambridge* and the *Colchester* of 1159 tons each. These latter mentioned ships are fitted up like Atlantic steamers. The first-class cabins are in the central portion of the ship, where the motion is least felt and where the vibration caused by the engines is not so considerable. The sailors' quarters are fore and the second class aft. There is an upper promenade deck and a few deck cabins, and there are smoking, dining and ladies' saloons. In fact, there is a sense of space and roominess which tends greatly to mitigate the terrors of a sea journey. A sense of security and comfort is engendered, and the timid traveller feels that in so big and splendid a ship he need not fear the waves and the sea. Then there are numerous small cabins containing two to four berths each, where comfortable bedding invites repose. There is time enough—the journey is long enough—to make it worth while to dress, and thus the passengers may sleep through the worst part of the voyage.

A natural dread is felt of an overcrowded and badly ventilated cabin, especially during a rough night; but the first-class sleeping cabins cannot be overcrowded and care has been taken to supply good ventilation. The ship is lighted throughout by electricity and every cabin has its own light, which can be switched on or off as each passenger may desire. Thus the lighting does not increase the heat of the cabins. Then in various parts of the ceiling above the berths there are apertures which communicate with a shaft abutting in the engine room. Here a part of the steam power is employed to set in motion a fan placed inside this exhaust shaft. By this means a powerful current is artificially produced which draws off the foul air from the cabins. The ventilation is therefore effected independently of temperature or weather. This is most important, for all systems of ventilation that depend on variations of temperature are unreliable and uneven in their results. No special measures are taken to provide air inlets, but these exist nevertheless; apart from the fact that fresh air can always come down the gangway there are what is known as goose-neck ventilators. These consist of metallic pipes three inches in diameter which descend from the sides of the deck into the cabins. The pipe, when it reaches the deck, is bent over like a goose's neck, with its mouth downwards, so that the water cannot enter the pipe. The air, however, easily travels round the curve and descends into the cabins below. These goose-neck ventilators serve either for outlet or for inlet. When the exhaust fan is not working they probably act as outlets, but when the engines are in motion and the fan revolves then they would become inlets, especially if the gangway was closed. To this arrangement we would suggest an easily effected improvement, which could at least be applied to the new steamer now in course of con-

struction, and which, it is claimed, will be larger and faster than any now on the line. We would urge that some at least of these goose-neck ventilators should be prolonged to the floor of the cabins. At present both inlet and outlet ventilators are all in the ceiling of the cabins. Air travels in a straight line from inlet to outlet. It does, by suction, draw away some of the air that is outside of the direct line of current; but we know full well that whereas the draught from an open door to an open window may be very strong, there are corners of the room that remain untouched. Thus, in these ships, the upper berths receive an unfair share of the ventilation. Of course the heat of the foul air makes it rise, and it thus gets caught up in the current. But we should like to see this current as active on the floor as on the ceiling of the cabins, and this result could be secured by prolonging some of the goose-neck ventilators to the level of the floor.

There is another point which we were not able to investigate, as the weather was too warm—namely, the heating of the cabins. This is secured by hot coils which are charged with steam. The question arises whether the inlets ought not to open near these hot coils, so that something of the sharpness of the cold wintry air may be mitigated. In winter more especially is the problem of ventilation most difficult. But it is encouraging to find that the subject has received considerable attention at the hands of the Great Eastern Railway Company; and though there may still be room for some improvement, we heard on all sides expressions of satisfaction at the airiness and coolness of the cabins. On the other hand, we noted with much regret that the air shaft communicating with the mechanical exhaust fan was not introduced in the second-class cabins. We would earnestly urge that in such a question no difference ought to be made between first and second class passengers. On the contrary, as the second-class cabins, if every berth was occupied, would be very crowded, greater care and greater energy in ventilating is necessary. The cost of prolonging the exhaust shaft from the ventilating fan to the second-class cabins would not be very great, and in any case, if this mechanical means of ventilation cannot be provided at both ends of the ship, then the preference should be given to the second class, where it is much more needed. We should say exactly the same thing of a Transatlantic steamer, where we maintain that the ventilation of the steerage is much more necessary and important than that of the saloons. We feel convinced that a company which has so lavishly provided for the comfort of its passengers and has spared no outlay to secure the latest improvements in the building of its ships, will take this criticism in good part, and will understand that, as the champions of public health, we can neither tolerate nor make any difference in classes of people or of passengers. All have equal need and an equal right to breathe as much pure air as it is practical to procure.

To return to the voyage. It has been seen that the passenger can enjoy a quiet supper before reaching the open sea; then a comfortable berth in a well-aired cabin affords him the means of repose and sleep while crossing the sea. This—for the distance to the mouth of the Scheldt is a journey of 90 miles—is performed in favourable weather in seven hours. For Rotterdam, the mouth of the Maas is reached in eight hours, the distance being 101 miles. This is a long journey as compared with the crossing of the Channel; but, on the other hand, those small, choppy waves which are so difficult to endure in the Channel are avoided. The ships being so much larger the motion is not so readily felt, and in any case it is slower, less jerky and irregular, and there are not a few persons who, though bad sailors, prefer a longer journey when the ship is larger and the motion easier to endure. On reaching the mouth of the Maas or of the Scheldt there is a long pleasant journey up these rivers. There the water is perfectly smooth; the passenger has some four hours before him to recover from any indisposition he may have experienced; then he can dress without hurry, wash at the excellent lavatories provided, and, refreshed and rested, he can take his breakfast at ease. Thus, when he finally lands at Antwerp or Rotterdam, he is not exhausted, but on the contrary, quite ready for a good day's business or pleasure. For the return journey the steamers by leaving Antwerp at 5.45 P.M. and Rotterdam at 6.15 P.M. are so timed that meals are taken in smooth water, and most of the passengers are in bed before the ship is on the sea. At Parkeston Quay next morning there are very comfortable and well-appointed lavatories, waiting-rooms and a restaurant, so that passengers can breakfast on land before the London and provincial trains leave. The boats

themselves go out in all weathers. Delays are only occasioned by exceptionally thick fogs.

To conclude, the Harwich route may be recommended for its comfort and cheapness. The ships are so large and well appointed that this to a considerable extent compensates for the greater length of the sea journey; and finally, if the traveller is overtaken by a storm or a gale, there is the company's hotel on the quay, where for a moderate cost he can wait for better weather.

## VITAL STATISTICS.

### HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 6190 births and 3511 deaths were registered during the week ending Aug. 20th. The annual rate of mortality in these towns, which had increased from 17.3 to 18.0 per 1000 in the preceding three weeks, was again 18.0 per 1000 during last week. In London the rate was 17.2 per 1000, while in the thirty-two provincial towns it averaged 18.5 per 1000. The lowest rates in these towns were 11.6 in Nottingham, 12.0 in Hull, 12.3 in Croydon and 12.9 in Gateshead; the highest rates were 21.9 in West Ham, 22.1 in Sheffield, 23.2 in Liverpool, 26.2 in Salford and 28.2 in Preston. The 3511 deaths included 680 which were referred to the principal zymotic diseases, against numbers increasing from 585 to 681 in the preceding three weeks; of these, 386 resulted from diarrhoea, 93 from measles, 62 from scarlet fever, 55 from whooping-cough, 49 from diphtheria, 34 from "fever" (principally enteric) and one from small-pox. No fatal case of any of these diseases was recorded last week in Newcastle-upon-Tyne; in the other towns they caused the lowest rates in Halifax, Swansea, Derby and Huddersfield, and the highest rates in Preston, West Ham, Salford and Sheffield. Measles caused the highest proportional fatality in Sheffield, Brighton, Salford, West Ham and Oldham; scarlet fever in Preston; whooping-cough in Portsmouth, Bradford, Burnley and Preston; "fever" in Preston; and diarrhoea in Brighton, Leicester, Bolton, Leeds, Portsmouth and Cardiff. The 49 deaths from diphtheria included 37 in London, 3 in Manchester and 2 in Salford. One fatal case of small-pox was recorded in Plymouth, but not one in any other of the 33 large towns. Nine cases of this disease were under treatment in the Metropolitan Asylum Hospitals and 4 in the Highgate Small-pox Hospital on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 3052, against numbers increasing from 1226 to 3088 on the preceding twenty-one Saturdays; 367 new cases were admitted during the week, against 346 and 376 in the preceding two weeks. The deaths referred to diseases of the respiratory organs in London, which had been 143 and 174 in the preceding two weeks, fell to 139 last week, and were 43 below the corrected average. The causes of 85, or 2.4 per cent., of the deaths in the thirty-three towns were not certified, either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Leeds, Nottingham, Portsmouth and Hull, and in eight other smaller towns; the largest proportions of uncertified deaths were registered in Gateshead, Birmingham, Leicester and Brighton.

### HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 18.5 and 17.0 per 1000 in the preceding two weeks, rose to 17.2 per 1000 during the week ending Aug. 20th, and was 0.8 per 1000 below the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 10.4 in Leith and 13.2 in Greenock to 22.3 in Perth and 23.0 in Paisley. The 480 deaths in these towns included 27 which were referred to diarrhoea, 15 to measles, 14 to scarlet fever, 11 to whooping-cough, 7 to diphtheria and 7 to "fever." In all, 81 deaths resulted from these principal zymotic diseases, against 83 and 93 in the preceding two weeks. These 81 deaths were equal to an annual rate of 2.9 per 1000, which was 0.6 per 1000 below the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of diarrhoea, which had been 31 and 32 in the preceding two weeks,

declined last week to 27, of which 16 occurred in Glasgow, 3 in Dundee and 3 in Paisley. The deaths referred to measles, which had been 23 and 19 in the previous two weeks, fell last week to 15, and 11 of these occurred in Glasgow and the other 4 in Edinburgh. The 14 deaths from scarlet fever showed an increase of one upon the number in the previous week, and included 12 in Glasgow and 2 in Edinburgh. The deaths from whooping-cough, which had been 11 and 16 in the preceding two weeks, declined again to 11 last week, and included 6 in Glasgow. The deaths from diphtheria, which had been 7 and 6 in the previous two weeks, were again 7 last week, and included 4 in Glasgow and 2 in Aberdeen. The deaths referred to diseases of the respiratory organs, which had been 77 and 74 in the preceding two weeks, rose last week to 76, and exceeded by 13 the number in the corresponding week of last year. The causes of 51, or nearly 11 per cent., of the deaths in the eight towns last week were not certified.

### HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 21.5 and 21. per 1000 in the preceding two weeks, declined to 19.5 during the week ending Aug. 20th. During the first seven weeks of the current quarter the death-rate in the city averaged 22.4 per 1000, against 17.8 in London and 16.2 in Edinburgh. The 131 deaths in Dublin during the week under notice showed a decline of 14 from the number in the preceding week, and included 12 which were referred to diarrhoea, 3 to measles, 2 to "fever" and one each to scarlet fever, diphtheria and whooping-cough, and not one to small-pox. In all, 20 deaths resulted from these principal zymotic diseases, equal to an annual rate of 3.0 per 1000, the zymotic death-rate during the same period being 3.4 in London and 1.8 in Edinburgh. The fatal cases of diarrhoea, which had been 5 and 6 in the preceding two weeks, rose to 12 last week. The deaths from measles, which had been 6 and 5 in the preceding two weeks, declined to 3 last week. The 131 deaths in Dublin last week included 23 of infants under one year of age and 24 of persons aged over sixty years; the deaths of infants showed a decrease of 6 and those of aged persons a decrease of 8 from the numbers in the previous week. Six inquests were held and 6 deaths from violence were registered; and 47, or nearly 36 per cent., of the deaths occurred in public institutions. The causes of 7, or rather more than 5 per cent., of the deaths in the city last week were not certified.

### VITAL STATISTICS OF CALCUTTA.

According to the weekly return, ending Saturday, July 23rd last, published by Dr. W. J. Simpson, the health officer of Calcutta, the total number of deaths registered in that city during the week was 181, against 207 and 193 in the preceding two weeks, and higher than the corresponding week of last year by 34. There were 5 deaths from cholera, against 23 and 19 for the preceding two weeks; the number is lower than the average of the past quinquennium by 6. No deaths occurred from small-pox, but there were 12 from tetanus, and the mortality from fevers and bowel complaints amounted to 65 and 23 respectively. The general death-rate of the week was 20.2 per 1000, which is the mean of the last five years. In the amalgamated area of suburbs the total number of deaths registered during the week was 121, higher than the corresponding week of last year by 14. There were 11 deaths from cholera, against 20 and 12 in the preceding two weeks; the number is higher than the average of the past three years by 6. No deaths occurred from small-pox, but there were 9 from tetanus, and the mortality from fevers and bowel complaints amounted to 47 and 24 respectively. The general death-rate of the week was 29.3 per 1000 per annum, against 28.1, the mean of the last three years. The general death-rate of the combined area is equal to 23.1.

## THE SERVICES.

### ARMY MEDICAL STAFF.

SURGEON-MAJOR-GENERAL ROBERT WYATT MEADOWS is placed on retired pay; Surgeon-Colonel Robert Lewer to be Surgeon-Major-General, vice R. W. Meadows; Surgeon-Colonel Charles H. Y. Godwin, from the Seconded List (having resigned his post of Professor of Clinical and Military

Surgery at the Army Medical School, Netley), to be Surgeon-Colonel, vice R. Lower (all dated Aug. 10th, 1892).

#### MOVEMENTS OF THE MEDICAL STAFF.

Surgeon-Captain Russell has been struck off the strength of the Cambridge Hospital, Aldershot. Surgeon-Captain Dixon is attached for temporary duty to the N.W. district. Surgeon-Captain Blackwell has rejoined at Woolwich from leave of absence. Surgeon-Captain Harris proceeds from Station Hospital, Devonport, to Okehampton for duty. Surgeon-Captains Reid and Duncan have returned to the Royal Victoria Hospital, Netley, from leave. Surgeon-Captain Begbie proceeds from Station Hospital, Portsmouth, to Aldershot, for a course of instruction. Brigade-Surgeon Gillespie, R.P., has assumed charge of the Station Hospital, Hamilton. Surgeon-Captain Daly has proceeded to the Curragh from Dublin for duty. Surgeon-Captain Burrows has proceeded to Cork from Longford for duty. Surgeon-Captain Browning proceeds from Templemore to Limerick for duty. Surgeon-Major Peyton has assumed charge of the Station Hospital, Enniskillen, from leave of absence.

The following is the list of successful candidates for commissions in the Medical Staff of Her Majesty's Army at the recent examination in London:—

Marks.		Marks.	
Pollock, C. E. . . . .	2815	Farmer, J. H. . . . .	2365
Mangan, F. M. . . . .	2470	Buswell, F. R. . . . .	2310
Rivers, J. H. . . . .	2470	Berrymen, H. A. . . . .	2295
Taylor, W. J. . . . .	2450	Symons, F. A. . . . .	2285
Longhurst, B. W. . . . .	2385	Samman, C. J. . . . .	2235

#### INDIAN MEDICAL SERVICE.

The following is the list of the candidates for Her Majesty's Indian Medical Service who were successful at the Competitive Examination held at Burlington House on Aug. 8th and following days (29 candidates competed for 17 appointments, of whom 21 were reported qualified):—

Marks.		Marks.	
Drake-Brockman, V. G. . . . .	2850	Langston, T. A. O. . . . .	2490
Milne, C. . . . .	2745	Ogilvie, W. H. . . . .	2490
Prall, C. B. . . . .	2720	Heard, R. . . . .	2405
Hunter, G. Y. C. . . . .	2640	Bourke, J. J. . . . .	2385
Young, W. . . . .	2620	Biddle, G. . . . .	2305
Macleod, J. N. . . . .	2615	Orr, W. H. . . . .	2230
Chatterton, F. R. . . . .	2600	More, P. St. C. . . . .	2200
Williams, C. E. . . . .	2580	Parry, E. R. . . . .	2195
		Morton, J. P. . . . .	2185

Surgeon-Major T. F. MacNece has been appointed to perform the Medical duties of the Lawrence School and Civil Establishment, Mount Abu, from June 2nd, 1892. Surgeon-Lieutenant-Colonel E. Mulvany, Civil Surgeon, Muzaffarnagar, has been permitted by the Secretary of State for India to retire from the service subject to Her Majesty's approval. Surgeon-Major C. H. Bennett has been appointed to be Civil Surgeon of Toung-hoo in addition to his military duties, vice Surgeon-Captain T. W. Stewart. Surgeon-Captain J. J. Pratt, Civil Surgeon, Gondal, has been transferred to the Civil Medical Charge of Fyzabad during the absence on leave of Surgeon-Major W. H. Cadge. Surgeon-Colonel J. Richardson, M.B., Inspector-General of Civil Hospitals, N. W. P. and Oudh, has been appointed to officiate as Surgeon-General and Sanitary Commissioner with the Government of India during the absence on privilege leave of Surgeon-Major-General W. R. Rice.

#### THE DISTINGUISHED SERVICE PENSION.

As we have already announced, a Distinguished Service Reward of £100 per annum held by the late Surgeon-General Hassard, C.B., has been conferred upon Surgeon-Major-General Reade, C.B. This officer joined the Army in March, 1854, served in the 2nd Battalion Rifle Brigade in the Eastern campaign of 1854-55, was present at the battles of Alma and Inkermann and siege of Sebastopol, and was wounded in November, 1855, at the explosion of the French siege train (medal with clasp and Turkish medal); he served with the battalion throughout the Indian Mutiny, and during the actions at Cawnpore, the capture of Lucknow, and the Oude campaign (medal with clasp).

The Secretary of State has notified that good-service pensions which may hereafter be conferred upon officers appointed to the Staff Corps after July 1st, 1891, shall be relinquished on retirement. The same rule applies to medical officers.

#### THE PROFESSORSHIP OF MILITARY SURGERY AT NETLEY.

We understand that Surgeon-Lieutenant-Colonel W. F. Stevenson, Army Medical Staff, is to succeed to the Pro-

fessorship of Military Surgery, rendered vacant by the resignation of Surgeon-Colonel Godwin.

#### HOSPITAL BUILDINGS.

In future the opinions of the Surgeon-General and the Sanitary Commissioner, Madras, are to be obtained by the Sanitary Engineer before he approves of any estimates for hospital buildings submitted to him.

#### THE CHOLERA.

The Government of India have recommended that Dr. Cunningham, Professor of Physiology in the Medical College, Calcutta, should be given two years more in which to complete his scientific observations on the subject of the origin of cholera.

#### VOLUNTEER CORPS.

*Artillery*: Surgeon-Major W. Hunter to be Surgeon-Lieutenant-Colonel (dated Aug. 20th, 1892).

#### THE REPORT OF THE ARMY VETERINARY DEPARTMENT FOR 1892.

Owing to the influenza epidemic, which seems to have attacked the horses rather seriously at home, but not in India, the average sickness was increased, but the proportion of deaths remained the same as in the previous year, 2.04. The average age of horses now serving is eight years and eight months. There are 426 horses of sixteen years and upwards. The Army Vaccine Institute appears to be doing good work. Since the opening of the institute in January, 1889, lymph has been prepared for no less than 121,044 people.

#### NAVAL MEDICAL SERVICE.

The following appointments have been made:—Fleet Surgeon John Tyndall to the *Crocodile* and Staff Surgeon John A. M'Adam to the *Camperdown* (both dated Aug. 22nd, 1892). Surgeons: Harold F. D. Stephens, M.B., to the *Camperdown*, Frederick W. Stericker, M.B., B.A., to the *Mistletoe*, and William J. Colborne to Haslar Hospital (all dated Aug. 22nd, 1892). Surgeon and Agent: David J. Lawson, M.D., at Portland (dated Aug. 24th, 1892).

#### MILITARY MANŒUVRES AND THE HEAT.

We have been more fortunate in this country with our autumn military manœuvres than our continental neighbours. The recent hot weather with them has been characterised by temperatures of a tropical kind and attended with a great many fatal results, an almost unprecedented amount of sunstroke and sudden attacks of heat exhaustion. From Trieste we learn that the troops manœuvring in the Karst hills, near Senosce, Camiola, have suffered greatly, no less than 200 cases of sunstroke having occurred among the men, with eleven deaths. From Vienna reports continue to be received of the almost unbearable heat that has prevailed and of the suffering of the troops in consequence. It is computed that at least one-third of the force composing the 71st Brigade recently engaged in an evolutionary march at Agram fell out of the ranks overcome by the heat. The officers suffered equally with the men, and one at least died on the roadside. The total number of deaths directly attributable to it amounted to 14. From France we learn that so many soldiers have been overcome by the heat, owing to marches not having been countermanded, that M. de Freycinet has issued a circular calling for reports on all such cases, so as to fix the responsibility on those who are to blame for their culpable want of foresight. The foregoing may be taken as samples merely of what the heat has been and of its disastrous effects on military forces marching or manœuvring; and reports from various other sources are all to a similar effect. Letters that have reached us from English people travelling in Germany speak of the heat as intolerable. As far as this country and our own army is concerned we have been, as we have said, far more fortunate. The heat has no doubt been great, but not at all comparable with what it has been elsewhere. On the 22nd inst. the brigade of Foot Guards, with a detachment of the Army Service Corps, marched by stages from Ash to Chobham after the Aldershot manœuvres—a distance of ten miles—and thence by Hounslow Heath to London. The Plymouth flying column marched from Okehampton to Dartmouth and reached Roborough, undertaking some manœuvres *en route*, which together may be reckoned as equal to twenty miles, and did it well. On the 20th inst. three officers of the King's Own Scottish Borderers, fully equipped, marched forty miles from Okehampton in sixteen hours, a good evidence of their training and physical form.

## CASUALTIES AMONG BRITISH SOLDIERS IN THE BOMBAY COMMAND.

In consequence of reports that had appeared as to the alleged excessive mortality amongst the drafts sent out to join British corps in India, Sir George Greaves, the Commander-in-Chief, Bombay, recently called upon the principal medical officer of that Presidency to furnish him with a detailed statement upon the subject, which Surgeon-General Webb has accordingly done. It appears that our contemporary, the *Pioneer*, in May last called attention to the subject in commenting upon the report of the Inspector-General of Recruiting. It will be remembered also that a question was put to Mr. Stanhope in the House of Commons regarding a part of the evidence of the late Commander-in-Chief at Bombay before Lord Wantage's Committee, and that the then War Minister stated his grounds for considering that the Duke of Connaught's impressions had been founded upon incorrect data. The report of the Principal Medical Officer, Bombay, goes very fully into the subject, and a Government resolution has been issued upon it to the effect that the complaints of excessive mortality and invaliding among young soldiers do not, at any rate, apply to British regiments quartered in the Bombay Presidency in the years 1889, 1890 and 1891. Still, anyone carefully reading the report itself will arrive at the conclusion that if the facts and figures fail to justify or substantiate the statements as to the excessive waste of young soldiers by death and invaliding as regards the Bombay command, they nevertheless do show that in proportion to their strength the rates of mortality are higher in soldiers young in years and Indian service than in other classes; and it would be very strange were it otherwise, considering that, for one thing, they have all to undergo the change from a temperate to a hot climate of which, and of all that this implies, they have had no previous experience. As to the loss among young soldiers from invaliding, the rates among them are not as high as in those of medium age; the inefficiency from sickness is probably greater; the total waste from death and invaliding is about the same at all ages up to twenty-five years and lessens considerably after that. It is—as we have said repeatedly, and as has, we think, been proved by experience—the soldier's liability to suffer from enteric fever and climatic diseases during the first and second years of his service in India that is the difficulty that has to be overcome. How is that to be effected? That is the point for Anglo-Indian sanitarians to take up. The first year of Indian service is the trying one for soldiers and it is then that the greatest care has to be taken in regard to them. After five years' service in India the climate begins again to tell on the constitution and the death-rate increases, and it and the invaliding-rate go on increasing. It is not, perhaps, so much that the soldier is young when he lands in India, according to all the statistical data furnished from that country, as that he must serve a year or two before his increased susceptibility to typhoid fever is surmounted,

## THE RELATIVE FREQUENCY OF ABSCESS OF THE LIVER AMONG EUROPEAN AND NATIVE TROOPS IN INDIA.

On comparing the statistics of the native with those of the European army for the year 1890 it will be found, according to the Report of the Sanitary Commissioner with the Government of India, that the death-ratio of Europeans from hepatic abscess was about thirty-five times higher than that of the natives of India, it having been twenty-five times higher in the two preceding years. Hepatic abscess contributed 7.6 per cent. of all the deaths of European soldiers and only 0.2 per cent. of the deaths of native soldiers.

## DYSENTERY AMONG EUROPEAN AND NATIVE TROOPS IN INDIA.

The highest admission rates for dysentery in India during 1890 were those of Burma, Quetta and Bengal Proper and Assam; the highest death-rates were those of Burma, Bengal Proper and Assam and Quetta. The death-rate of native troops from dysentery was to that of Europeans as 1.5:1; dysentery caused 7 per cent. of all the deaths of native soldiers, whereas it only caused 5 per cent. of the deaths of European soldiers, and this difference was the same as in the preceding year.

## THE MESSING OF THE SOLDIER.

We would call attention to a pamphlet, which may be obtained at the cost of sixpence, on the messing of the soldier, including schedules illustrative of the new system of

military cooking, issued by direction of Lieut.-General Sir Evelyn Wood, V.C., G.C.B., commanding the Aldershot Division. It contains information as to the best and most economical cooking and disposal of the soldier's rations and groceries, revised up to the date of the present month, likely to prove useful to medical officers and others whom it may concern.

## "THE LANCET COMMISSION ON SANITATION IN RELATION TO THE LAW AND PRACTICE OF HOUSE-LETTING."

To the Editors of THE LANCET.

SIRS,—I notice an article in *The Times* of Saturday referring to an inquiry made by you and as to the granting of certificates by the sanitary inspector of a town after a thorough examination of the premises, specially mentioning the town of Eastbourne. I beg to inform you we have issued these certificates for some time past, and they have been largely applied for by the inhabitants. They are only granted after a most searching examination by our inspector. I should be glad to send you a copy of the certificate should you care to see one.—I am, Sirs, yours, faithfully,

S. PENFORD,

Mayor of Folkestone.

Folkestone, Aug. 22nd, 1892.

To the Editors of THE LANCET.

SIRS,—Your report on sanitation in relation to the law and practice of house-letting is instructive and interesting reading. Dr. Farquharson's Sanitary Registration of Buildings Bill, introduced into the late Parliament, has evidently not been without effect, as from your report it appears that in part its proposals have been adopted by the sanitary authority at Eastbourne. Dr. Farquharson's Bill, to quote the leading article of *The Times* on the occasion of its second introduction (Feb. 23rd, 1887) proposed "to impose compulsory sanitary inspection and registration upon every building intended to be used as a school, college, hospital, asylum, hotel, or lodging-house, and to give opportunities for voluntary inspection and registration in the case of all other buildings; whatever." Interesting as the report from Eastbourne is: too general to be accepted as conclusive, and I would venture to suggest that the authorities at Eastbourne might with advantage contribute to your columns some statistics illustrating the extent to which the sanitary registration of buildings has been carried out by them.

The total number of houses in Eastbourne should be given and the number registered as in a satisfactory sanitary condition, together with some indication of the standard of excellence insisted on before certificates are given. Whether the services of public officers are given gratuitously and, if so, whether to the extent of advising upon the necessary work to secure the certificates.

I am, Sirs, yours faithfully,

EDWARD T. BLAKE, M.D., M.R.C.S.,

Life Assoc., Sanitary Institute, Great Britain; Corresp. Memb.,

Amer. Inst.; Memb. of French Hygienic Soc.; &c.

Berkeley Mansions, Aug. 24th, 1892.

## "ON ACTINOMYCOSIS OF THE FOOT, COMMONLY KNOWN AS MADURA FOOT."

To the Editors of THE LANCET.

SIRS,—On returning from my holiday my attention was drawn to Mr. Kanthack's letter criticising my paper under the above title, which appeared in *THE LANCET* of July 2nd, 1892. Mr. Kanthack says he "found it necessary to defend himself from a criticism based on a mere report." I criticised Mr. Kanthack on one point only, and gave him all the credit I could. In the latter part of his letter Mr. Kanthack seems to imply that the statements which I attributed to him were obtained elsewhere than from the printed reports of the meeting. Such is not the case, all those statements appeared in the reports of the meeting of the Pathological Society, published in *THE LANCET* and *British Medical Journal*. As

Mr. Kanthack allowed the reports to pass uncorrected I naturally concluded that they represented his views. Mr. Kanthack, however, need not make a misstatement. I did not assert that in "all" cases of actinomycosis bovis Gram's method, with or without preliminary treatment, gives brilliant results. The word "all" does not appear in my paper in this context. For the great majority of cases my statement is true. It is a fact that a few specialists have for some time recognised the identity of actinomycosis bovis and actinomycosis hominis, but it is only within the last three or four years that this identity has been "fully" and "generally" recognised. As late as 1887 Israel himself and Koch failed to identify Dr. Acland's case as one of actinomycosis.<sup>1</sup> Mr. Kanthack asserts 'as far as my experience goes—and this is the usual experience—in cattle the clubs are absent as frequently as in man.' The clubs are generally, and probably at one stage or another always, present in both actinomycosis hominis and actinomycosis bovis; in the former they are not usually stained by Gram's method, in the latter they are almost invariably deeply stained.

Mr. Kanthack next makes the extraordinary assertion that "in actinomycosis, whether in man or in cattle, the central mycelial zone, the true and typical fungus elements always stain with Gram's method, but the *hyaline clubs* never do; in fact, they refuse any nuclear stain." This is the rule with regard to actinomycosis hominis, but in actinomycosis bovis the clubs generally stain deeply with Gram's method,<sup>2</sup> while the bovine cases in which a central mycelial zone is stained are even now so rare as to be worthy of being recorded when they occur. Mr. Kanthack says "it is now acknowledged by all competent mycologists that the hyaline rays are of no morphological or biological importance, and are probably due to some degenerative changes." Some competent mycologists undoubtedly hold this view, but others, equally competent, consider that the club-shaped bodies may be important structures, and play a part in the development or reproduction of the organism. With regard to Mr. Kanthack's statement that "the extraordinary differences in the staining reactions of the human form from those of the bovine are certainly new and require confirmation," I may say that attention was drawn to them by Dr. Acland and Professor Crookshank five years ago, and I regret that, as is evidently the case, Mr. Kanthack should have written on actinomycosis without having studied Professor Crookshank's exhaustive reports on this subject. Mr. Kanthack next quotes me unfairly. I quite agree with him that in madura disease the clubs are "gigantic," and they were so in my specimen. What I said, or certainly implied, in my paper was that the clubs did not stain with Gram's method, and hence were apparently absent. A line or two further on I distinctly stated that the clubs were present.

I take this opportunity of correcting an error which appears in my paper. The reference to Baumgarten (ref. 4) should be Baumgarten's Jahresber. u. Path. Mikroorg. iv., 1888, p. 300, note.

I fear I have already occupied much space, and I will therefore conclude by referring Mr. Kanthack to the historical and pathological researches on actinomycosis by Professor Crookshank published in the report to the Agricultural Department for 1888. This report is now about four years old; in it many of the points alluded to here are dealt with most fully.—I am, Sirs, yours faithfully,

King's College, Aug. 18th, 1892.

R. T. HEWLETT.

## DANUBE FEVER.

To the Editors of THE LANCET.

SIRS,—Dr. Oliver's paper in your issue of August 13th calling attention to the occasional admission into English hospitals of cases of Danube fever and febrile diseases allied thereto leads me to mention the case of a Russian sailor received into the Liverpool Fever Hospital last autumn. O. S.—, aged twenty-five, sailed on the return voyage from Galatz to Rotterdam, the voyage occupying from sixteen to seventeen days, and of a crew of twenty-five hands thirteen suffered either before leaving the Danube river or at various times on the voyage from illness referred by them to the ailment locally known familiarly as "Danube fever." The crew were paid off at Rotterdam, several of them, including

O. S.—, being still ill. The latter was admitted ten days later into the Liverpool Fever Hospital, South. his case having been notified as one of enteric fever. Death ensued three days subsequently to admission, on Sept. 25th. Clinically, the case ran during the three to four days under observation at the hospital a course entirely distinct from typhoid fever: fever, remittent in type, presenting a diurnal range from the normal to 104°, on one occasion with rigor, and at time of death reaching 106°, was associated with symptoms pointing to uræmia, death resulting from coma. The urine contained blood in large proportion; the skin, bathed in profuse sweat, was of yellow tint, this deepening before death noticeably; pulse 80, full, regular, quickening towards the end to 120 and failing; twitching of face and hands, nystagmus with apparent paralysis of upper extremities, on day preceding death; stools loose and orange-yellow in colour, the patient lying inert and motionless, becoming unconscious on second day after admission. The principal points noted post mortem were extreme congestion of internal organs, splenic enlargement to weight of nineteen ounces, and inflammation of membranes of brain and heart, meningitis and endocarditis being present; no enteric lesion. The illness was attributed to drinking Danube water by the patient and other members of the crew, and ran, as far as I could gather from accounts obtainable, a somewhat relapsing course in the various cases, including that of my patient. The fatality in other cases could not be ascertained.

I am, Sirs, yours faithfully,

C. KNOX BOND,

Aug. 23rd, 1892. Medical Superintendent, Bradford Fever Hospital.

## "PROSECUTION FOR FALSE CERTIFICATE OF DEATH."

To the Editors of THE LANCET.

SIRS,—The brief account in THE LANCET of August 20th of the "false" death certificate given by me omits an important fact: and as the press has prominently reported the case with extraordinary distortion and scandalous imputations, I trust you will do me the justice to give my version of the affair. Thus—I learnt in the daily papers that I kept a dispensary and swindled the poor of their money and lives, though I conduct a middle-class practice at a private residence; that the patient had been visited twice by an unqualified man was given great importance to; that I had sent a registered practitioner to see the case and that he was quite willing to give the certificate was not mentioned. These are the facts: On July 25th a patient sent a message to my surgery requesting a visit. My unqualified assistant went. There were then no serious symptoms. He went again next day and found her much worse. He sent for me. I was engaged with a bad midwifery case and knew I could not leave for hours. I have a grave constitutional defect. I cannot be in two places at once; but I did the best I could under the circumstances. I sent a message to my colleague Mr. Herring of Sussex-road, N., to see the patient for me. He has been paid by me for going and was therefore my agent. He agreed with the diagnosis and treatment and has since written to the Registrar General to say he would have been quite willing to give a certificate. I arrived on the scene a few minutes after death and never saw the patient alive. I have been much blamed for not giving Mr. Herring's certificate to the friends. But I did not take the trouble, for the following reason. It is an actual fact that if language is taken in its ordinary sense, it is possible to truthfully fill up a death certificate as at present worded without having seen the patient till after death. This is an astonishing statement and has probably occurred to no one before. But it is beyond all dispute. I could in this case truthfully give the cause of death "to the best of my knowledge and belief." I could truthfully state when I had "last seen" him or her. But could I logically and truthfully say I had attended the deceased? A little reflection showed me I could. It is first necessary to understand the meaning of the word "attend," as used on a death certificate. Like many other words in the English language it has two meanings as different as night from day. In the phrases "attending an auction," "attending court," "attending a funeral" it means simply "going to" and nothing more. But there is overwhelming evidence that on a death certificate it means nothing of the kind. Medical attendance means "attending to" patients, it means treating them. I can attend patients at my own house. But could I truthfully and logically say I had treated a patient

<sup>1</sup> Brit. Med. Jour. vol. ii., 1887, p. 97.

<sup>2</sup> With coloured plates in Professor Crookshank's Report to the Board of Agriculture on Actinomycosis.

whom I had never seen? A thousand parallel examples showed me I could. Would not an engineer naturally say that he had built a bridge, though he had done it entirely by proxy? And when he had said it, who would be so insane as to accuse him of lying? If a registrar's tailor met him in the street and asked him (the registrar) for some money, because he had made him a suit of clothes, the registrar would carefully inquire whether the tailor had really made them himself. Finding he had neither seen nor touched the cloth, he would call him a wilful perverter of the truth and pass on. I could multiply these instances *ad infinitum*. Therefore if the statements just quoted can be truthfully made, I could truthfully say I had attended the deceased on the certificate for which I was fined. For the crime of using language in its ordinary sense I have had to pay nearly twenty pounds, and I was pelted with mud while my hands were tied. The real person to blame is the stupid individual who worded death certificate forms. They ought to read thus: "I certify that I *personally* attended to.....during h... last illness and that I last saw h... *alive*." There is no ambiguity about this. It was unfortunate for me that my solicitor did not point out to the magistrate the real meaning of "attend" as used by medical men. If he had done so, the summons must logically have been dismissed.

I am, Sirs, yours obediently,

Seven Sisters-road, Aug. 20th, 1892. STEPHEN SMITH, L.S.A.

\*\* We publish our correspondent's letter, although we certainly do not think that his arguments greatly amend his position.—ED. L.

#### "ANNUAL REPORT OF THE SANITARY COMMISSIONER WITH THE GOVERNMENT OF INDIA FOR 1890."

To the Editors of THE LANCET.

SIRS,—In reviewing the above report in your issue of Aug. 20th, you dwell at some length on the mortality and sickness caused by enteric fever among the British troops in India. That it is a subject of great importance to the army nobody can deny. Not only many lives are lost both among the men and officers, but the State also suffers a great pecuniary loss by the sickness and invaliding caused by it. With your permission I shall attempt to say a few words on the subject from the little experience I have had both among the British and native troops in India. You ask the question whether enteric fever is or is not prevalent among the native population in India? I have no hesitation in saying that natives of India do not suffer from it to the extent the Europeans do in India. There is no doubt that the enteric fever is essentially the same in pathology in India both among the Europeans and Indians, as the corresponding fever in Europe. If that is the case the question arises, How is it that it is not so prevalent among the latter as among the former? It is more puzzling when one thinks of the sanitary surroundings of both the classes. He must be a bold man who can put his finger on any sanitary defect anywhere to be found in the barracks of the British soldiers in India. As you rightly observe, there are no imperfect drains and sewer air to account for the cause of the disease. It cannot be put down to the water-supply, as not only is it good, but is nowhere better looked after than in the barracks in India. If that is the case where should we look for the cause? Is it due to milk? I think not. The admirable paper by Sir Charles A. Cameron in the Cavendish lecture on "Some Points in the Etiology of Typhoid Fever" seems to remove the difficulty on that point. He says: "I must deprecate the common practice of referring every case of disease to polluted water, defective sanitary accommodation, or leaking sewers. The fact is undoubted that an improved water-supply in Dublin has not been followed by a diminution of typhoid fever." The theory of Rondet and Roux appears more acceptable. If that theory is correct, there is no doubt that bacilli coli communis are in abundance in cantonment bazaars in India, which are not only frequently visited by the British soldiers, but at some stations they are in close proximity to the barracks. Granting that it is the case, the question again faces us, Why should Europeans suffer more than the natives? I think the activity of the lymphatic system in the former has a great deal to do with the conversion of the harmless bacillus into the virulent form of bacillus of Eberth.—I am, Sirs, yours truly,

Aug. 23rd.

P. J. DAMANIA, D.P.H.

## THE CHOLERA IN BELGIUM.

(FROM OUR SPECIAL CORRESPONDENT.)

Brussels, August 23rd.

ALL matters relating to public health in Belgium come under the jurisdiction of the Ministry of Agriculture and Commerce. Thither I went this morning to seek for information concerning the supposed outbreak of cholera in Belgium. I found that a Council had been hastily summoned. The Minister and other persons concerned were gathered together to discuss this question of cholera and to take measures. The consultation was of course held with closed doors, and I do not pretend to have penetrated Ministerial secrets. Nevertheless I can say this much that the strongest indignation was expressed against the attitude of the press. For the sake of publishing sensational news an alarm had been raised which was likely to gravely compromise the commercial relations of Belgium. Yet no one present was able to deny that deaths had occurred at Antwerp and at Jumet. The Government lays stress on the mussels which the sailors of the *St. Paul* had eaten; the press, on its side, insists rather on the fact that three out of the four sailors attacked died and that their symptoms were those of cholera. The Government complains that the press is more eager to give bad news than good news, and raises unnecessary alarm, which is likely to damage the trade of the country. To this each newspaper replies that if it abstains from giving the news other newspapers will be less scrupulous and that, therefore, secrecy is impossible. For my part I cannot help thinking that the press on one side and the Government on the other are both in the wrong, or indeed I might, with equal justice, say that they are both in the right. Certainly there is no cholera epidemic in Belgium as yet, but it is equally certain that the events of the last few days justify the fear as to the possibility of such an epidemic breaking out. The Government is quite right in saying that there is no immediate cause of alarm; the press has only done its duty in recording what has happened and in putting the public on its guard.

About a fortnight ago, in Brussels, an old woman of dissipated habits, a drunkard, was seized with violent cramps, vomiting, diarrhoea, and died. This woman was an inhabitant of Brussels. She had not been in contact with foreigners. There was no reason to believe that this was a case of imported cholera. Such cases occur every year without epidemics ensuing. Brussels has a very efficient sanitary administration. There is no need to alarm the public in Brussels so as to enforce sanitary measures which otherwise would not be accepted. Therefore the sanitary authority quietly took all the measures which would have been taken had this been a genuine case of Asiatic cholera and nothing was said about it. A fortnight has now elapsed and there has been no other such case in Brussels. But what has occurred at Jumet is altogether different. There are three great centres of population in Belgium—namely, the neighbourhoods of Brussels, Liège and Charleroi. The mining town of Jumet has a population of 24,000 inhabitants, while the historical town of Charleroi, which is some five miles distant, has only 21,000 inhabitants. Both towns may be considered healthy. The mortality at Jumet during the first quarter of this year was equal to 18.5 per 1000, and during the second quarter to 18.1. At Charleroi the mortality was, during the first quarter of this year, 18.5 per 1000, identically the same as at Jumet, and during the second quarter considerably less, namely, 15.3. It would seem therefore that the public health is fairly good, though the great majority of the population consists of coal miners, glass-blowers, metal workers and others who labour hard for their living, and often only obtain very meagre wages. During the great cholera epidemic of 1866 the mining population of Jumet suffered extensively, especially the inhabitants of the mining villages of Agasse and Quirelles and within the last fortnight or three weeks there have been a great number of cases of violent diarrhoea or cholera in this district. On the Wednesday of last week a Belgian miner named Van Esbecq, aged forty-two, felt somewhat indisposed. Though a native of Jumet, he had gone to Paris and was working in some brickfields near Paris. There he probably drank some of the contaminated Seine water. In any case he determined to go home and on reaching his house, at Jumet-

Gohyssart, he became much worse and died on the Friday, the symptoms being similar to those of cholera. A child two years old, named Henri Hayel, living in the next house died the next day, apparently from the same cause. Then another child was seized by the same complaint, and in all, I believe, nine cases occurred in rapid succession, though some of the victims lived at a distance of several hundred yards from the first case. To-day there have been, as yet, no new cases reported from Jumet, but it is stated that at the hospital of Charleroi there are three patients suffering from cholera nostras.

What gives exceptional gravity to the news from Jumet is the fact that the first case was that of a man who had just arrived from the suburbs of Paris, where we know there has been a considerable amount of genuine cholera. Then the sanitary conditions of a district like that of Jumet are apt to facilitate the spread of the disease. A correspondent, writing from the spot to the *Brussels Gazette*, relates that the inhabitants of the district of Jumet are particularly fond of fishing. In 1866, when an official inquiry was instituted in consequence of the prevalence of cholera, it was found that many miners kept in their houses dead animals so as to breed maggots, which they used as bait for fishing. Thus in a bedroom, where several persons slept together, a dead horse's head covered with maggots was found. The inhabitants failed to understand that there was any harm in sleeping side by side with the decomposing flesh of animals. In other cases it was ascertained that to avoid the trouble of going out in the yard at night the inhabitants went into their coal cellars, and thus a quantity of fecal matter was mixed with the coal used for domestic purposes. How far the spread of education has improved the present generation still remains to be seen, but the recollection of these facts does not tend to inspire a sense of security.

The Sanitary Commission of the Hainaut, which comprises the Charleroi and Jumet districts, has been convoked in hot haste. Eminent and well qualified hygienists and medical men belong to this Commission; but will they possess the legal powers to act as the emergency demands? The police, we are told, are distributing disinfectants gratuitously; but do the persons to whom they give these substances know how to use them?

While the cholera was thus menacing the populations some thirty miles south of Brussels, some twenty-seven miles north of that city, at Antwerp, the French steamer *St. Paul* arrived from Havre and began to unload at the west quay of the Kettendyck Dock, near to a steamer called the *St. Marc*, on which a boiler explosion recently occurred. The ship was undergoing repairs. On the 16th of this month one of the crew of the *St. Paul* was seized with violent cramps and conveyed to the Stayvenberg Hospital, where he died. On the 17th, Alexis Bian and Jean Collin, suffering in the same way, were also taken to the same hospital, and on the 20th they were followed by another member of their crew named Jean Rolland. Of these four men three are now dead. It is said that they ate a large quantity of mussels, and it is hoped that the mussels and not the cholera are the cause of their death. But two members of the crew of the *St. Marc*, which is anchored next to the *St. Paul*, had received slight burns from the boiler explosion, and they were undergoing treatment, also at the Stayvenberg Hospital. Whether it be the effects of fear and imagination or a mere coincidence or the effects of contagion, there is as yet no evidence to show, but one of these men, François Breydel, while undergoing treatment for his burns was seized with choleric symptoms on the 18th inst. and died. To-day more significant news is to hand. The barge *Jeune Adèle* came to the Kettendyck dock, where the *St. Paul* is unloading. The wife of the skipper, Jeanne Van Keer, was seized with violent cramps, and her child, aged four years, suffered in the same manner. The woman was conveyed to the hospital and died on Sunday. No one says that this woman, or her child, or the sailor François Breydel from the ship *St. Marc* had eaten mussels; but both this ship and the barge were in the same dock and near to the *St. Paul*.

Nevertheless the Belgian Government blamed the Belgian press for causing mischievous alarm by publishing some of the above details. Undoubtedly it is wrong to unnecessarily alarm people and to pretend that there is a cholera epidemic in Belgium at the present moment as the state of public health, notably at Brussels, is exceptionally good in spite of the great heat. But, on the other hand, the press would be singularly remiss in its duties if, in the face of the above facts, it did not pronounce an energetic warning. The good that such warning does is illustrated this

morning at the Sanitary Bureau of Brussels, where a great number of letters have been received from various householders who imagine that their drains are not in order. No such letters had been sent for a long while, and if they have come to-day in such numbers it is because the population is awaking to the necessity of taking proper precautions. This is just what should be done. The death-rate at Brussels for the week ending August 13th was 20 per 1000 and the sanitary condition of the town is good. The Sanitary Bureau, since its creation in 1874, has overhauled, altered and improved the drainage &c. of 11,000 to 12,000 houses out of the 18,000 houses which compose the town of Brussels. The result has shown itself in a very great reduction of mortality. Brussels is well prepared to face an epidemic. I only wish the same could be said of the neighbourhood of that city and of the rest of Belgium.

Our correspondent, writing on Wednesday, Aug. 24th, says:—The *Moniteur Belge*, the official gazette of the Belgian Government, publishes this morning a circular addressed by the Minister of Agriculture to all the governors &c. of the various provinces of the kingdom. The circular commences with the assertion that "epidemic cholera has not as yet manifested itself in any locality of the country, and the general sanitary condition remains excellent. But the extension of Asiatic cholera in certain foreign countries should excite the watchfulness of the public powers." Then follow very lengthy and revised instructions as to the measures and precautions which should be taken against cholera. It will be noted that the Government circular does not deny the existence of cases of cholera; it only maintains that "as yet" there is no epidemic. This is rigorously correct and confirms what I attempted yesterday to explain.

The *Patriot* of to-day publishes an interview with Dr. Masoin of Louvain, Professor at the University and member of the Belgian Academy of Medicine. Dr. Masoin states that he believes there have been cases of real cholera in Belgium, because the patients had come from France; where real cholera undoubtedly exists.

At Brussels Dr. Janssens, chief of the sanitary bureau, has summoned all the police who volunteered to act as a reserve-force for the service of disinfection &c. These men have all been trained, and it is only necessary now to see that they have not forgotten any of the lessons given in the past and are still ready to act if necessity should arise for calling out these reserves. The town authorities are thus quite ready for any emergency, though the public health continues excellent.

## MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

### *The Manchester Royal Infirmary.*

THE trustees of the Royal Infirmary have decided that no extension on the present site of that building shall take place. The ballot papers, which were opened on last Monday week, showed a majority of 140 against the proposal of the board of management; but whether from a lack of interest on their part or from a feeling of their inability to decide so momentous a question, only a little over half of those authorised to vote recorded their voices. The consequence of this decision is that the infirmary will be carried on in the accustomed way. Whether or no another attempt will be made by the Owens College authorities to induce the infirmary board to build upon the college land remains to be seen. The consent of the infirmary to such a proposal would undoubtedly be the easiest relief from the difficulties of the college authorities, who, in case of an adverse decision, would probably themselves commence the building of a general hospital on their estate. The funds necessary for this purpose, together with an income sufficient to maintain the hospital would, however, first have to be provided and would no doubt take time to collect. In connexion with this it is worthy of note that the majority of memorialists by whose exertions the proposal of the infirmary board was the other day rejected disclaim any idea of working for the benefit of the college and have fought their battle solely upon the "open space," "value of surrounding property" platform. They profess to retain their approval of the infirmary in its present state and management; nevertheless, whatever their motives may be, their action has considerably strengthened the hands of the Council of the Owens College, and has very much weakened those of the infirmary board.

Manchester, Aug 24th.

## NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

*The British Medical Association Meeting at Newcastle, 1893.*

A PRELIMINARY meeting to promote the objects of this meeting at Newcastle in 1893 was held last Thursday at the College of Medicine, Dr. Philipson, president-elect, in the chair.

*Berwick.*

A very successful bazaar has been held at Berwick to promote improvements at its suburb Spittal, including a sea-wall and a promenade on its splendid beach. Earl Percy opened the proceedings.

*The Thompson Bequest to the Poor of Byker, Newcastle.*

The ceremony of laying a wreath over the tomb of the late Mr. Thomas Thompson of Jesmond was duly observed last week at Jesmond Cemetery. A few years ago a Mr. Louis Thompson of Byker, Newcastle, left the handsome amount of £15,000 to the poor of Byker on condition that a wreath should be placed on his father's tomb annually by the guardians of the poor of the district; should the ceremony, however, be omitted for three years the amount is to be paid over to the national exchequer. The interest of this large sum has been duly paid to the Poor-law guardians of the district, and is a great relief to the rates.

*Small-pox in the North of England.*

A good deal of concern is expressed as to the continuance of small-pox in the north of England from Leeds to Stockton and Middlesbrough. At the last place there were fourteen cases in the hospital, twelve being from Middlesbrough and two from Stockton. So far Newcastle and the Tyneside continue clear; indeed, the general health of the district is excellent.

*North-Eastern Convalescent Home.*

The half-yearly meeting of the North-Eastern Friendly Societies' Convalescent Home at Grange-over-Sands was held last week at Sunderland, and the report was very satisfactory. After doing a very useful amount of work, there remains a balance in hand, so that this institution is a good example of the coöperative system applied to medical purposes. The Home was built for working men, being managed and supported by them.

*Ambulance Work in the North.*

Mr. Galbraith, surgeon, of Gosforth, near Newcastle, having delivered a course of ambulance lectures and given instructions to a class of thirty students during the session 1891-92, an examination took place by Dr. Mears with highly satisfactory results. Last week the students were presented with their medals and certificates, Mr. Galbraith receiving at the same time an address and presentation in appreciation of his services.

*Death of Mr. John Currie Steele, J.F.P.S. Glas.*

Mr. John Currie Steele, surgeon, of Willington Quay, died last week at the early age of forty-eight, much regretted. He was one of the first surgeons of the district to give systematic ambulance instruction to the numerous workmen of mid-Tyne, where his services were much appreciated, and he was the recipient of numerous public testimonials in recognition of his worth.

*The Accident to Dr. Cook of Gateshead.*

Further news of the late severe accident in Norway to Dr. Cook of Gateshead has been received in Newcastle. Mrs. Cook is now with her husband where he is laid up but doing well at a private hospital in Bergen. It appears that when the horse bolted the vehicle was overthrown by coming in contact with the wall of a bridge, below which, at a distance of forty feet, rolled a turbulent stream over granite boulders. Dr. Cook had his sternum fractured as well as several ribs. He first received attention from Mr. Taylor of Braintree, Essex, and Dr. Burton of Huddersfield. The Norwegian surgeons, Drs. Christie Sandberg and Middlefast, under whose care Dr. Cook is now, have been most kind and attentive. He will of course have to remain in Norway for some time, as the North Sea is no respecter of fractured sternum and ribs.

A beautiful stained glass window has been placed in Blyth Parish Church by Mr. Gilbert Ward of Blyth in memory of his son Dr. Henry Debord Ward.

Newcastle-on-Tyne, Aug. 23rd.

## IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

*Queen's College, Cork: Annual Report.*

DURING the session 1891-2 the students on the books of the College were 255, of whom 251 were matriculated and 4 non-matriculated. Of these 255 students 199 were enrolled in the Faculty of Medicine. Among the pressing wants of the College that of a new chemical laboratory stands foremost. The professor reports that not half the requisite number of working benches was available for the students who attended lectures in the practical branch of his subject. The arrangements for ventilation and for storage of apparatus are also defective. The rooms occupied by this department are required for a physical laboratory and for an engineering and technical museum. The need of the former is shown by the fact that the professor of Natural Philosophy is obliged, by the smallness of his lecture-room, to divide his class in Practical Physics into several sections. An excellent site for building may be had in the Materia Medica garden. The President points out that a new chemical laboratory, fully provided with the most recent appliances and apparatus, is approaching completion in Queen's College, Belfast, and he therefore hopes that a similar boon, so often applied for, will no longer be withheld from Queen's College, Cork.

*Lurgan Waterworks.*

It has been determined to supply Lurgan with water from Lough Neagh, and the Government have promised to advance a sum of £21,000 to carry out the necessary works. A special meeting of the Town Commissioners was held last Saturday to consider tenders for the carrying out a contract for the construction and erection of reservoirs, filter beds, machinery houses &c. A tender for £10,650 was accepted.

*Deaths of Centenarians.*

Daniel Lyons died at Castleisland last week aged 103 years. Lyons fought in the Peninsular War, and had been a pensioner for the last sixty-eight years. James Lynch died at Ballycumber, King's County, also aged 103. He retained his mental faculties to the last, and attended to his work until a few minutes before his death. He dropped down dead while out walking.

*Military Infirmary, Phoenix Park.*

The military authorities, acting on the suggestion of the principal medical officers, have determined to close the Royal Infirmary to the admission of patients in consequence of the insanitary condition of the grounds. It is stated that the patients at present in the infirmary and the attendants will be accommodated in a portion of Steevens' Hospital.

*Death of Mr. Gregory Sala.*

I record with regret the death of this gentleman—highly esteemed in the locality in which he practised—which occurred on Sunday last, at his residence, Newpark House, Kilmegaw, co. Kildare, after a tedious illness from the effects of influenza; he was forty-seven years of age. He was naturally of a somewhat delicate constitution, and suffered of late a good deal from rheumatism. The complications of influenza which he suffered from were prostatic abscess and neuritis of the arm. The latter caused such intolerable agony that he required very large doses of opiates several times repeated to produce any sleep. Suffering such intense torture, and with an already enfeebled constitution, it is not surprising that he succumbed after several months' suffering. He leaves a widow and a daughter to mourn their loss.

*Health of Dublin for 1891.*

The report of Sir Charles Cameron, medical officer of health for the past year, has just been issued. The births in Dublin Registration District numbered for the year 9850, or 29 per 1000; while the deaths amounted to 9195, or 25.5 per 1000. Zymotic diseases caused 865 deaths, or 390 below the average number for the past ten years. It is gratifying to note that the mortality among children has of late fallen considerably. There was not a single death from small-pox in Dublin during 1891, only 2 deaths from measles, and 3 from typhus fever; while whooping-cough caused 134 deaths. But, although typhus fever may be said to have disappeared, typhoid fever shows no decrease. During 1891 the deaths from typhoid fever numbered 172, or in the ratio of 52 per 100,000, and as to the cause of this increase of

typhoid fever cases and consequent mortality it is difficult to conjecture, especially as last year the disease was more prevalent than in former years. Defects in house drains and sewage matters in the soil are supposed to have some bearing on the matter, and no doubt the house drains in a large proportion of Dublin houses are to a great extent defective, and it has been suggested that the subsoil is saturated with water which has been allowed to accumulate, rendering the site damp and unhealthy, and that this is the most likely cause. Sir Charles Cameron says that no accurate scientific explanation of the cause of the undue prevalence of typhoid fever in Dublin has yet been published. The most probable hypotheses are those which indicate polluted soil, and defective sewers and house drains as the principal causes. As to soil pollution, there is no doubt that it prevails largely, and the greater part of Dublin is literally built upon a "water-logged site." For the greater part of the twenty-four houses the mouths of the main sewers which open on the River Liffey are closed by valvular tidal gates; it is only when the tide is low that the sewage of Dublin flows into its outlet (the Liffey), and it is only when the tide is out that the subsoils are drained. For a large portion of the day, therefore, drainage is suspended in the soils, and they acquire that damp and (in summer) warm condition so favourable to the development of low organisms.

#### Pharmacy Prosecutions.

Two members of a most respectable firm of chemists in Dublin were prosecuted at the instance of the Pharmaceutical Society this week on the charge that last month medical prescriptions were compounded by them contrary to the Pharmacy Act 38 and 39 Vic., cap. 7, sec. 30. Fines were inflicted in two of the cases of £5 each and three guineas costs. Prosecutions for breaches of the Pharmacy Act are no doubt right and proper, but if the society were to investigate as to whether some of their licentiates are not busily engaged in counter prescribing, probably they would be disagreeably surprised.

#### The Belfast Royal Hospital.

On Monday, Aug. 22nd, the quarterly meeting was held and from the report presented I learn that during the previous three months there were 690 intern patients and 5371 extern cases. All accounts against the hospital up to the end of July are paid, this result being due to the centenary bazaar, but, compared with last year, there is a falling-off in general subscriptions and in church collections; while, on the other hand, there is an increase in the contributions of the working-classes. Dr. T. K. Wheeler was re-elected surgeon and Dr. J. A. Lindsay physician, and Mr. Davidson was appointed house physician in place of Dr. Mitchell, resigned.

#### A Wealthy Pauper.

At the usual meeting of the Board of Guardians, held on Aug. 23rd, the master reported that a man who was admitted on the previous day had in his possession a number of Ulster Bank notes and American bonds representing a sum of £1335. It was decided to make inquiries whether there were any friends who would take charge of him.

On the recommendation of the Duke of Abercorn the Lord Chancellor has appointed Mr. A. W. Flood, R.N., F.R.C.S. Eng., of Bundoran, county Donegal, to the Commission of the Peace for the county of Donegal.

Mr. Thomas Collins has been re-elected representative of the Apothecaries' Hall on the General Medical Council.

Mr. William Henry Digges, L.R.C.P. Edin., of Sackville-street and Accourt Lodge, Merrion, has been placed on the Commission of the Peace for the city of Dublin.

The death is reported at Santos, South America, from yellow fever, of Mr. Matthew J. McDonogh, L.R.C.S.I. &c., eldest son of Mr. F. J. McDonogh, J.P., of Willmount House, Portumna. August 23rd.

## PARIS.

(FROM OUR OWN CORRESPONDENT.)

#### Ménière's Disease a Symptom of Chronic Bright's Disease.

PROFESSOR DIEULAFOY was, I believe, the first to call attention to the frequency of auditory troubles in the course of chronic interstitial nephritis. That clinician indeed regards

them as more frequent than troubles affecting the organ of vision. The ear complications take the form of generally incomplete deafness, accompanied or unaccompanied by noises, and sometimes associated with sharp pains in the ear or in the face. Dr. Bonnier has recently conducted some inquiries on this subject and he finds that "auricular Brightism," as he denominates this condition, may manifest its presence, not only by the above symptoms, which are referable to cochlear changes, but by others dependent upon morbid modifications of the labyrinth. These latter remind one pretty accurately of the condition first described by Ménière, consisting as they do of vertigo, nausea, vomiting, syncope and apoplectiform phenomena; gyratory movements, unsteadiness of gait and irresistible falls in a given direction. This form of Ménière's disease, according to Dr. Bonnier, paroxysmal in character, and it is generally due to vaso-motor troubles, such as congestions, hæmorrhage or œdema of the internal ear determined by uræmia. It may be an early indication of kidney disease or appear late in its course. Quinine, which is so successful in the ordinary form of Ménière's disease, is useless here, the only efficient means of combating it being: recourse to an exclusive milk diet. Under the influence of this simple means of treatment it speedily gives way. This observation of Dr. Bonnier once more emphasises the importance of examining the urine in the presence of any symptoms of which the origin appears obscure.

#### Hydrophobia in Paris and in the Department of the Seine.

From a report just compiled by Dr. Dujardin-Beaumetz for the Sanitary Board of the Seine Department it appears that in the period comprised between Jan. 1st, 1881, and Dec. 31st, 1891, 101 persons died of hydrophobia in the capital and in the Department in which it is situated. Of these, 74 were males and 27 females. The prevalence of the disease was most marked in 1881 (21 cases), 1885 (22 cases) and 1888 (19 cases). The attention of the police authorities having been drawn to the evils of canine vagrancy at each of these dates, the malady became quickly more rare. The statistics of the Institut Pasteur are worth transcribing, as they go to prove irrefutably the efficacy of the inoculations therein practised. The figures run thus:—

	Persons treated.	Deaths.	Mortality.
1887 ... ..	306	3	0.97 per cent.
1888 ... ..	386	5	1.29 " "
1889 ... ..	236	3	1.27 " "
1890 ... ..	95	0	0.00 " "
1891 ... ..	201	0	0.00 " "

From 1886 to 1892, 11,029 persons suffering from dog-bites were treated at the institute. Of these patients 98 succumbed despite the treatment, making a mortality of .88 per cent.

#### The Health of Paris.

In my last letter but one I was able to announce an encouraging improvement in the health of this metropolis, particularly with regard to the endemic of cholera, which has been our unwelcome guest of late. The report for the first fortnight of the present month of the Permanent Vigilance Committee of the Conseil d'Hygiène de la Seine has recently been issued, and it is, on the whole, reassuring reading. From it we gather that from July 20th to Aug. 3rd there died in the suburbs, of *diarrhée cholériforme*, seventy-two persons. For the period elapsing between Aug. 4th and 17th the fatal cases had fallen to thirty-three. In Paris itself, the deaths during the first and the second periods respectively were thirty-four and sixteen. This latter figure coincides pretty exactly with that usually found during the hot season of the year. It is only surprising that the exceptionally intense heat (10°C. above the usual summer temperature) that prevailed for so long a time should not have had the effect of further increasing this very moderate mortality from diarrhœa. Sixteen deaths in a population of over two and a-half millions is nothing very alarming. Notwithstanding that the authorities are not relaxing in their efforts toward off the threatening foe, and 20,000 sanitary leaflets are to be forthwith distributed amongst the people through the agency of the Prefecture of Police. I regret to say, however, that an increase of typhoid fever cases is announced, there having been reported to the Bureau des Epidémies ninety-three cases for the first fortnight of the present month, as against seventy-seven for the last fortnight of July.

Paris, Aug. 24th.

## BERLIN.

(FROM OUR OWN CORRESPONDENT.)

*Cholera Nostras in Germany.*

On the 21st inst. twenty-two persons fell ill of so-called cholera nostras in Hamburg, and seven of them have died. Two deaths from the same disease are also reported from the Governmental circle of Namslan in Silesia.

*Professor Virchow.*

Professor Virchow arrived at Warsaw on the 11th inst., was received with all due honour by a deputation of the medical men of that city, visited all the hospitals and museums, and left on the 12th for the Congress of Anthropologists and Archæologists at Moscow, accompanied by his son, Professor Hans Virchow, and a young Russian savant, Dr. Popov. From Moscow the dauntless old man intended to proceed to the interior of Russia to study the cholera epidemic. A portrait of him by Hans Pechner, which was exhibited at this year's exhibition of the Berlin Academy of Art, has been bought by a citizen of Berlin and presented to the Children's Hospital, founded by the Emperor and Empress Frederick, energetically assisted by Professor Virchow and others, where it is hung in the pavilion for external diseases.

*The Foot-and-mouth Disease in Saxony.*

The foot-and-mouth disease has been spreading alarmingly in Saxony during the last few weeks. No fewer than 393 agricultural establishments were declared infected between the 31st July and the 14th inst. In very many cases the infection is stated to have been carried by human beings.

*"A Wise Woman."*

A boy near Berlin sprained his foot in the first week of this month. His mother fetched a so-called "wise woman" (Kluge Frau) who had acquired a reputation for miraculous cures. She resolved to cure the boy by "sympathy." She pulled and squeezed the foot, repeating formulas the while, till the poor lad fainted with pain. To enhance the effect she scratched the skin of the swollen foot at several places and rubbed ointment into the wounds. Next morning the whole leg was swollen and extravasated with blood. A doctor was sent for and declared the boy to be suffering from blood-poisoning, which rendered it necessary to amputate the leg. The operation was performed in the Charité, and the "wise woman" is to be, or has been, prosecuted.

*Tramway Hygiene.*

The following letter from a medical man to one of the Berlin daily newspapers is likely to interest many of your readers: "A strong young man can certainly bear standing for hours together without feeling any special inconvenience; nay, perhaps, for a while, though wind and weather are rough enough upon him in his almost unprotected place, he hardly feels the hardship to be one at all. But the fact is that the human body is not adapted by nature for such uninterrupted effort; it needs the alternation of work and rest, and the interval of a minute or two at the end of the drive can hardly be regarded as deserving the latter designation. The consequence is—to single out the main evil only—that disturbances of the circulation set in, followed, above all, by varicose veins, which look very harmless at first, but which in course of time, and especially on the approach of old age, may become a terrible plague and prepare the way for those incurable ulcerations which render those who suffer from them unfit for work of any kind. Two little seats, one in front and one behind, so constructed that they can be folded down at will, would suffice considerably to improve the situation of tramway officials, without narrowing the room for passengers or diminishing the efficiency of the service."

Berlin, Aug. 28rd.

**PURIFICATION OF SEWAGE AT PUDSEY.**—The Pudsey Local Board has instructed Mr. W. Spinks, civil engineer of Manchester, to prepare a plan for the erection of sewage works on ten acres of land at Hough Side. The cost is estimated at £3000, and about three and a half acres will be thus utilised. The system to be adopted will be that of precipitation with prepared filters. The consent of the Local Government Board is the only preliminary to the carrying out of the proposed plan.

## Medical News.

UNIVERSITY OF EDINBURGH.—The following candidates have received the degree of Doctor of Medicine:—

- \*Allison, B. Dunlop Reid, M.B., C.M., Scotland (with Second-class Honours).
- †Beaton, Gilbert Taylor, M.B., C.M., Scotland.
- †Brock, George Sandison, M.B., C.M., Scotland (with Second-class Honours).
- †Campbell, Alfred Walter, M.B., C.M., Australia.
- †Chasseaud, Henry Maurice, M.B., C.M., Asia Minor.
- †Clark, Henry Martyn, M.B., C.M., India.
- †Clarke, Edmund Wearne, B.Sc., M.B., C.M., England.
- †Clemow, F. Gerard, M.B., C.M., Eng. (with Second-class Honours).
- †Closs, Joseph Osborne, M.B., C.M., Scotland.
- †Cullen, George Matheson, M.B., C.M., Scotland.
- †Dick, James Adam, B.A., M.B., C.M., Australia.
- †Dole, William, M.B., C.M., Scotland.
- †Ezard, Edward Henry, M.B., C.M., England.
- †Fox, Richard John, M.B., C.M., India.
- †Gibson, Edmund Valentine, M.B., C.M., England.
- \*Gillespie, Alexander Lockhart, M.D., C.M., Scotland.
- †Hall, William Winslow, M.B., C.M., India.
- †Hall, Arthur Herbert, M.B., C.M., England.
- †Havelock, John George, M.B., C.M., England.
- †Keay, Joseph Hay, M.A., M.B., C.M., Scotland.
- †Kitchin, James Tyson, M.B., C.M., England.
- †Leslie, George, M.B., C.M., Scotland (with Second-class Honours).
- †Lockwood, William, M.B., C.M., England.
- †MacGregor, Alexander James, M.B., C.M., Scotland.
- †McKie, Norman James, M.B., C.M., England.
- †Magrath, Chas. William Stanford, M.B., C.M., England.
- †Mansel, Charles John Linskill, M.B., C.M., England.
- †Maynard, Edward Forster, M.B., C.M., England.
- †Meadows, Robert Thornton, M.B., C.M., Canada.
- †Mitchell, William Gordon, M.A., M.B., C.M., Scotland.
- †Morison, Basil Gordon, M.B., C.M., India (with First-class Honours).
- †Munro, Andrew Watson, M.B., C.M., Scotland.
- †Murray, William, M.B., C.M., Scotland.
- †Northcote, Augustus Beauchamp, M.B., C.M., England.
- †Pare, John William, M.B., C.M., England.
- †Parham, William Maskelyne, M.B., C.M., England.
- †Playfair, John, M.B., Scotland.
- †Poole, Thomas Dobson, M.B., C.M., England.
- †Pope, Roland James, B.A., M.B., C.M., Australia.
- †Russell, James, M.A., M.B., C.M., Scotland.
- †Savory, Charles Butler Beck, M.B., C.M., England.
- †Simpson, James Bertie, M.A., M.B., C.M., Scotland.
- †Someren, George Arbuthnot van, M.B., C.M., Scotland.
- †Symonds, George Henry Hamilton, M.B., C.M., England.
- †Thomas, William Evans, M.B., C.M., Wales.
- †Thompson, Isaac, M.B., C.M., England (with Second-class Honours).
- †Thomson, J. Christopher, M.A., M.B., C.M., Scotland (with Second-class Honours).
- †Thornton, George, M.B., C.M., England.
- †Turner, Alfred, M.B., C.M., England.
- \*Turner, W. Aldren, M.B., C.M., Scotland (with First-class Honours).
- †Walcot, Thomas, M.B., C.M., England.
- †Walker, Edward, M.B., C.M., England (with First-class Honours).
- †Ward, T. Hamilton, M.B., C.M., England (with First-class Honours).
- †Watson, William Muir Crawford, M.B., C.M., Scotland.
- †Webb, Sidney Roberts, M.B., C.M., England.
- †Weston, William Henry, M.B., C.M., England.
- \*Whiting, Arthur John, M.B., C.M., England.
- \*Wilson, Theodore Stacey, B.Sc., M.B., C.M., England (with Second-class Honours).
- †Winder, Arthur Benjamin, M.B., C.M., England.
- †Wise, Robert, M.B., C.M., Scotland.

\* Received Gold Medals for their Dissertations.

† Deemed worthy of competing for the Dissertation Gold Medals.

‡ Commended for their Dissertations.

The following candidates have received the degrees of Bachelor of Medicine and Master in Surgery:—

- Adamson, R. Edward, England.
- Allan, James, Scotland.
- Ancrum, G. Wayland, England.
- Anderson, James Shirras, M.A., Scotland.
- Armstrong, R. Henry, England.
- Bagram, Geo. Joakim, Armenia.
- Barber, Thaddeus B., West Coast of Africa.
- Barnardo, G. Fleming, England.
- Bassano, T. Matthias, England.
- Beddle, Lewis B., M.A., Scotland.
- Bell, George, England.
- Benson, H. P. D'Arcy, Australia.
- Beveridge, J. J., M.A., Scotland.
- Bill, George, Australia.
- Bond, Chas. Hubert, England.
- Bremner, Dugald C., Scotland.
- Brown, J. Chalmers, Scotland.
- Brown, T. M'Lachlan, Scotland.
- Browne, Hablot J. M., England.
- \*Brownlie, Alexander, Scotland.
- Brunton, W. M'Queen, Scotland.
- Burn, David Haily, Scotland.
- Butler, F. Sydney, Cape Colony.
- Butters, George, Scotland.
- Campbell, D. Graham, Scotland.
- Campbell, W. Sibbald, Scotland.
- Carruthers, John F., Scotland.
- Christie, J. G., M.A., Scotland.
- Cillers, Pieter G., Cape Colony.
- Clayton, F. H. Aylon, England.
- Cock, Geo. Herbert, England.
- Coles, Herbert Davis, England.
- Coope, Anthony B. J., England.
- Corson, R. Atchison, Scotland.
- Davidson, S. G., M.A., Scotland.
- Davies, Richard, England.
- Dick, John Lawson, Scotland.
- Dickson, George, Scotland.
- Dobie, Edward Cyril, England.
- Donald, Chas. Wm., Scotland.
- †Douglas, Alex., M.A., England.
- Dubourg, Wm. Ernest, Scotland.
- \*Easterbrook, C. Cromhall, M.A., England.
- †Edgington, Daniel Chas., Scotland.
- Ehrke, Frank Leigh, England.
- †Evans, John James, Wales.
- Evans, Rufus Easson, England.

\* Received First-class honours.

† Received Second-class honours.

Fellows, F. Macfarlane, England.  
 +Fells, Arthur, England.  
 Fentem, Thomas, England.  
 Fletcher, William, England.  
 Fortane, Ernest Geo., Scotland.  
 +Fowler, Jas. Stewart, Scotland.  
 Foye, Martin Hugh, Ireland.  
 Fullarton, J. A., B.A., New Zeal.  
 Gardard, Edward, Blako, England.  
 Gibb, Wm. Scott, Scotland.  
 Gordon, William, England.  
 Gow, William Baxter, Scotland.

Sutcliffe, Thomas Taylor, H. W. Vaughan Williams, J. G. Walker, J. W. T. Walker, E. E. Waters, J. M. Wishart, J. J. H. Wood, R. J. T. Wright, M.A.

\* Passed with distinction.

SOCIETY OF APOTHECARIES OF LONDON.—The following candidates have passed in the respective subjects:—

*Surgery*—W. D. Akers, St. Mary's Hospital; D. Berne, Royal Free Hospital; F. G. Doroy, Yorkshire College, Leeds; E. G. Firth, Yorkshire College, Leeds; W. Fowler, Durham; E. E. Francis, St. Bartholomew's Hospital; W. Handcock, Yorkshire College, Leeds; B. H. F. Leumann, St. Bartholomew's Hospital; W. S. Mercer, Charing-cross Hospital; W. H. F. Noble, London Hospital; A. V. Poatling, St. Thomas's Hospital; B. Saul, Charing-cross Hospital; D. L. Thomas, London Hospital; W. Thomas, Yorkshire College, Leeds; A. E. Wilson, St. Mary's Hospital.

*Medicine, Forensic Medicine and Midwifery*—R. S. Bernard, King's College; F. Dove, London Hospital; E. G. Firth, Yorkshire College, Leeds; V. P. Foote, Charing-cross Hospital; E. E. Francis, St. Bartholomew's Hospital; R. T. Gilmour, St. Mary's Hospital; J. L. Iredale, Yorkshire College, Leeds; J. Joule, London Hospital; H. L. A. Keller, St. Thomas's Hospital; M. C. Langford, London Hospital; B. H. F. Leumann, St. Bartholomew's Hospital; R. E. Nichols, St. Mary's Hospital; P. J. P. Smith, St. Thomas's Hospital; S. Smith, Middlesex Hospital.

*Medicine and Forensic Medicine*—J. E. Balloy, University College; W. Handcock, Yorkshire College, Leeds; J. J. Powell, St. Thomas's and Cambridge; D. F. Roberts, Guy's Hospital; J. D. Willis, Owens College, Manchester.

*Forensic Medicine and Midwifery*—F. Howgate, Yorkshire College, Leeds; W. S. Newton, London Hospital; J. W. Roberts, Liverpool; W. H. Waddington, Owens College, Manchester.

*Forensic Medicine*—J. B. Bate, Bristol; A. A. Macfarlane, St. Bartholomew's Hospital; A. W. Taylor, London Hospital; J. Wood, St. Thomas's Hospital.

To Messrs. Akers, Bernard, Dove, Firth, Francis, Gilmour, Keller, Langford, Leumann, Macfarlane, Nichols, Noble, F. J. P. Smith, Thomas, and Waddington was granted the diploma of the Society entitling them to practise Medicine, Surgery and Midwifery.

FALL OF A GRAND STAND AT BUXTON.—At Buxton, on Friday last, during the progress of the annual Horse Show, the grand stand, containing some 700 persons, suddenly collapsed. Among the injured was Dr. Allan of Whaley Bridge, whose left leg was broken.

\* Received First-class Honours.  
 † Received Second-class Honours.

The following awards have been made:—

*Estles Scholarship*.—Robert Murray Leslie, M.A., B.Sc., M.B., C.M.  
*Beauey Prize in Anatomy and Surgery*.—Alexander Brownlie, M.B., C.M.  
*Stark Scholarship in Clinical Medicine*.—Robert Murray Leslie, M.A., B.Sc., M.B., C.M.  
*Freeland Barbour Fellowship in Anatomy, Physiology, and Pathology*.—George Home, M.B., C.M.  
*Goodsir Memorial Prize*.—George Neil Stewart, D.Sc., M.D., and Arthur John Whiting, M.D.

*Gunning Victoria Jubilee Allison Prize in Public Health and Medical Jurisprudence*.—Alexander Houston, M.D.  
*Buchanan Scholarship in Gynecology*.—John Lawson Dick, M.B., C.M.  
*James Scott Scholarship in Midwifery*.—Charles Cromhall Easterbrook, M.A., M.B., C.M.  
*Wrightman Prize in Clinical Medicine*.—D. A. Welsh, MA.

The following are the official lists of candidates who passed the First and Second Professional Examinations at the University during last month:—

*First Professional Examination*.—C. W. Anderson, D. N. Anderson, Frederick Anderson, J. W. Anderson, John Ballantyno, N. D.

**LITERARY INTELLIGENCE.**—We are informed that the "History of Guy's Hospital," a book on which Dr. Wilks has, with the assistance of the late Mr. G. T. Bettany, been some time engaged, will be ready for publication in the course of a few weeks.

**PUBLIC DISPENSARY, LEEDS.**—This institution, in the sixty-eighth year of its existence, maintains its enlarged usefulness and efficient working. An increase upon the year 1891 of 1500 patients were treated during the past twelve months, 3023 patients had been visited at their own homes, and 15,997 visits paid; the number of operations performed was almost double that of the previous year.

**THE MANCHESTER CREMATORIUM.**—This crematorium, which adjoins the north-west corner of Withington Cemetery, was on Monday last used for the first time. The doors screening the furnace were draped in black, before which the coffin was placed in position, and upon releasing a spring the doors opened and the coffin, which rested upon wheels, ran into the furnace.

**THE INFIRMARY, NORTH DEVON.**—From the annual report for the past year, just issued, it appears that during the long career of the institution it was never before in so efficient a working order or in a more satisfactory sanitary condition. 655 in-patients and 2317 out-patients respectively received the benefits of the hospital in the twelve months. The Convalescent Home at Morthoe, built and endowed by Mr. Rock and his sister, Mrs. Payne, has been a great boon to patients from the infirmary and to others recommended by the medical men of the neighbourhood. The balance-sheet shows a small balance at the bankers', with £200 on deposit note.

**PRESENTATIONS.**—Dr. J. J. Hood of Wollongong, New South Wales, on leaving that district for Maclean was presented in May last by the inhabitants with a handsomely illuminated address and a purse of sovereigns.—On the 22nd inst. Dr. G. W. Moseley was presented by the members of the Quorn classes of the St. John Ambulance Association with a handsome dressing-case. In March last Dr. Moseley was the recipient of a richly-mounted walking-stick from the members of the Barrow-on-Soar classes. All the members of the above classes with one exception were successful in passing the examination in first aid.—Dr. T. J. Burroughs of Crondall, Hants, has been the recipient of a testimonial from his patients and friends consisting of an illuminated address and a purse of 125 sovereigns.

**THE METROPOLITAN ASYLUMS BOARD.**—The Report of the Metropolitan Asylums Board showing the number of patients in the several Metropolitan fever hospitals states that up to August 23rd there were in the Eastern Hospital 387 cases of scarlet fever, 81 cases of diphtheria, 2 cases of typhus and 39 cases of enteric fever. The North-Western Hospital had 383 cases of scarlet fever, 83 of diphtheria and 21 of enteric fever. The Western Hospital showed 247 cases of scarlet fever, 36 of diphtheria and 7 of enteric fever. In the South-Western Hospital there were 295 cases of scarlet fever, 64 of diphtheria and 15 of enteric fever. The South-Eastern Hospital contained 358 cases of scarlet fever, 22 of diphtheria, one of typhus fever and 6 of enteric fever. The Northern Hospital had 657 beds occupied by scarlet fever patients and only 20 by patients suffering from diphtheria; whilst the Gore Farm Hospital showed the highest number of scarlet fever patients—namely, 720.

**THE SPREAD OF GLANDERS.**—A meeting of cab proprietors and other owners of horses in the north of London was held at Beale's Restaurant, Holloway-road, on Monday last, to "petition Government to compensate for horses slaughtered and to enforce stringent measures to prevent glanders from spreading." Mr. W. Pierson, who occupied the chair, pointed out that small owners could not afford to employ a veterinary surgeon, the consequence being that glanders was allowed to spread. He submitted that the only chance of successfully combating the disease was to get the Government to compensate all owners who slaughtered their horses. Mr. Marcus Stevenson, veterinary surgeon, stated that medicine in this disease was of little avail. The disease, he said, was propagated by allowing animals to drink out of water-troughs and by feeding them out of nose-bags which had been used for glandered horses. He hoped that now water-troughs were closed they would never be opened again.

**MEDICAL MAGISTRATE.**—Mr. Henry W. Coleman, L.R.C.P. Edin., M.R.C.S., has been placed on the commission of the peace for the borough of Leeds.

**ST. ANNE'S-ON-THE-SEA DRAINAGE SCHEME.**—The ceremony of cutting the first sod in connexion with this scheme took place on the 18th inst. The plans were prepared by Mr. Bancroft, engineer, of Manchester, and the estimated cost will be about £9000.

**SUPERANNUATION.**—Dr. Barnes, the medical officer of the Ewell district, Surrey, has been granted a superannuation allowance of £35 and a further sum of £15, conditional on the consent of the Local Government Board.

**NEED OF MORTUARY ACCOMMODATION.**—In the course of a coroner's inquiry, held at the Queen Victoria inn, Stratford, into the circumstances attending the death of a man who was killed last week on the South-Eastern Railway, the coroner made some pointed and highly necessary remarks on the need of mortuary accommodation. The parochial committee had, it appears, expressed their readiness to contribute to the cost of the building, but the rural authority had not shown any favour to the proposal. In the case in question the body had to be taken charge of by the station master. Doubtless the observations of the coroner in this instance will apply to many districts all over the country.

**REQUESTS AND DONATIONS TO HOSPITALS.**—Mr. Frank Clarke Hill, of Peshurst, bequeathed £1000 to the British Home for Incurables, Wanstead, and £200 to the Metropolitan Convalescent Institution. Ex-Provost Duncan bequeathed £2000 to the Brechin Infirmary. Mr. Edmund Crawley, late of Cullum-street, London, bequeathed £200 each to the London Hospital, Guy's Hospital and the Royal Hospital for Incurables, Putney, and £100 to the City of London Truss Society. Mr. Thos. Green, late of the Smithfield Ironworks, Leeds, bequeathed £250 to the Leeds Infirmary, £100 each to the Leeds Dispensary and Cookridge Convalescent Hospital, and £50 to the Eye and Ear Hospital. The Grocers' Livery Company has voted £100 to the Royal Sea Bathing Infirmary, Margate. The trustees of the late Mr. Alex. McNab, of Middleton, Kerse, Menstrie, have allocated £500 to the Alloa Hospital. The late Mr. Greswolde Williams bequeathed £1000 to the Worcester Infirmary. A donation of £60 13s. 4d., the result of the Friendly Societies' hospital demonstration, has been forwarded to the Hartlepool Hospital. A native of Blandford bequeathed £1000 to the Blandford Cottage Hospital. A sum of £75 has been handed to the treasurer of the Children's Hospital, Great Ormond-street, being the result of the sixth annual demonstration and church parade in aid of that institution.

## Appointments.

 HARPER.—On Aug. 17th, at Rosary-gardens, South Kensington, the wife of James Harper, M.D., of a daughter.  
 HEDDY.—On Aug. 20th, at 46, Redcliffe-gardens, S.W., the wife of William Jackson Heddy, M.R.C.S. Eng., of a daughter.  
 HOLMES.—On Aug. 20th, at 14, Old Burlington-street, W., the wife of Dr. W. Reid Holmes, of a son.  
 MESSITER.—On Aug. 14th, at Charlton House, Dudley, Worcestershire, the wife of M. Arden Messiter, M.R.C.S., of a son.  
 ROGERS-TILLSTONE.—On Aug. 22nd, the wife of H. Rogers-Tillstone, M.D., of a daughter.  
 SEWILL.—On Aug. 22nd, at Wimpole-street, the wife of Henry Sewill, M.R.C.S., L.D.S. Eng., of a son.  
 STURGES.—On Aug. 19th, at Mirzapore, Beckenham, Kent, the wife of Frank Sturges, L.R.C.P. Lond., of a daughter.  
 WELLS.—On Aug. 19th, at Beckenham, Kent, the wife of A. Primrose Wells, L.R.C.P., L.R.C.S. Edin., M.A., of a daughter.

### MARRIAGES.

DENMAN-SHARMAN.—On Aug. 17th, at St. Peter's Church, Bournemouth, Robert Denman, L.R.C.P., L.S.A., of Selborne, Bournemouth, to Hilda, second daughter of the late Eric Rudd Sharman, of Liverpool.  
 EDWARDS-HOOPER.—On Aug. 17th, at St. Mary's, Bexley, George F. Edwards, M.D., of Bridge House, Bexley, to Constance Eliza nee h. eldest surviving daughter of Alfred T. Hooper, of Alderley, Bexley.  
 FITCH-WILLIS.—On Aug. 16th, at St. Cassyion's Church, Chaddeley Corbett, Worcestershire, Charles Dennis Fitch, M.R.C.S., third son of F. Fitch, Esq., M.D., of Chaddeley Corbett, to Beatrice Mary, elder daughter of H. R. Willis, Esq., of Brockencote Hall, Chaddeley Corbett, and of Kidderminster.  
 HILL-COX.—On Aug. 16th, at St. Pancras Church, Euston-road, William Henry Hill, M.B., of Church Fields, Basford, to Fanny, elder daughter of Charles James Cox, of Basford, Nottingham.  
 PURVES-COOK.—On Aug. 23rd, at St. Peter's, Rock Ferry, by the Rev. E. Owon, Llangedog, assisted by the Rev. Paige-Cook, vicar of the parish, and the Rev. D. L. Clarke, Scot Purves, M.D., Alnwick, son of the late T. Purves, Esq., J.P., of Kibthail, Sutherlandshire, to Isabel Cicely, daughter of E. Cook, Esq., of Alnwick.  
 STEEL-MITCHELL.—On Aug. 17th, at Myrtle Bank, Carriage Hill Paisley, by the Rev. A. Fife Burns, St. George's Parish, assisted by the Rev. W. H. Killock, of Kilmaurs, Robert Steel, Physician and Surgeon, of Kilmaurs, to Jeannie, youngest daughter of Andrew Mitchell, Esq.

### DEATHS.

ABERCROMBIE.—On Aug. 20th, at Harrow, John Abercrombie, M.D., F.R.C.P., of Upper Wimpole-street (formerly of Cheltenham) aged 76.  
 CROOKES.—On Aug. 16th, at Augusta-gardens, Folkestone, John Farrar Crookes, F.R.C.S., in his 82nd year.  
 DRYSDALE.—On Aug. 20th, at Beach Lawn, Waterloo, near Liverpool, John James Drysdale, M.D., of Rodney-street, Liverpool, and Pittouchar, Fifo, N.B., aged 76.  
 FORBES.—On Aug. 17th, at Redcliffe, Exmouth, S. Devon, David Forbes, M.D., formerly of Rock Ferry, Cheshire, in the 62nd year of his age.  
 LANGLEY.—On July 13th, on board s.s. *Saladin*, off the Coast of Western Australia, John Geoffrey Langley, M.B., M.R.C.S., L.S.A., aged 40.  
 PEARL.—On Aug. 18th, at his residence, Sylvan-road, Upper Norwood, Edward Pearl, M.R.C.S., aged 65.  
 POLLOCK.—On Aug. 16th, at his residence, Oak Lodge, Wimbledon-park, Robt. Jas. Pollock, F.R.C.S., aged 87.  
 WAYMAN.—On Aug. 18th, at Foulsham, Norfolk, suddenly, C. P. Scott Wayman, Surgeon.  
 WOODCOCK.—On Aug. 17th, at Springfield Hall, Wigan, Robert Fraser Woodcock, L.R.C.P. Lond., M.R.C.S. Eng., aged 33.

N.B.—A fee of 5s. is charged for the Insertion of Notices of Births, Marriages, and Deaths.

## Medical Diary for the ensuing Week.

## Monday, August 29.

- ST. BARTHOLOMEW'S HOSPITAL.—Operations, 1.30 P.M., and on Tuesday, Wednesday, Friday, and Saturday at the same hour.
- ROYAL LONDON OPHTHALMIC HOSPITAL, MOORFIELDS.—Operations daily at 10 A.M.
- ROYAL WESTMINSTER OPHTHALMIC HOSPITAL.—Operations, 1.30 P.M. and each day at the same hour.
- CHELSEA HOSPITAL FOR WOMEN.—Operations, 2.30 P.M.; Thursday, 2.30.
- HOSPITAL FOR WOMEN, SOHO-SQUARE.—Operations, 2 P.M., and on Thursday at the same hour.
- METROPOLITAN FREE HOSPITAL.—Operations, 2 P.M.
- ROYAL ORTHOPÆDIC HOSPITAL.—Operations, 2 P.M.
- CENTRAL LONDON OPHTHALMIC HOSPITAL.—Operations, 2 P.M., and each day in the week at the same hour.
- UNIVERSITY COLLEGE HOSPITAL.—Ear and Throat Department, 9 A.M.; Thursday, 9 A.M.

## Tuesday, August 30.

- KING'S COLLEGE HOSPITAL.—Operations, 2 P.M.; Fridays and Saturdays at the same hour.
- GUY'S HOSPITAL.—Operations, 1.30 P.M., and on Friday at the same hour. Ophthalmic Operations on Monday at 1.30 and Thursday at 2 P.M.
- ST. THOMAS'S HOSPITAL.—Ophthalmic Operations, 4 P.M.; Friday, 2 P.M.
- ST. MARK'S HOSPITAL.—Operations, 2 P.M.
- CANCER HOSPITAL, BROMPTON.—Operations, 2 P.M.; Saturday, 2 P.M.
- WESTMINSTER HOSPITAL.—Operations, 2 P.M.
- WEST LONDON HOSPITAL.—Operations, 2.30 P.M.
- ST. MARY'S HOSPITAL.—Operations, 1.30 P.M. Consultations, Monday, 2.30 P.M. Skin Department, Monday and Thursday, 9.30 A.M. Throat Department, Tuesdays and Fridays, 1.30 P.M. Electrotherapeutics, same day, 2 P.M.

## Wednesday, August 31.

- NATIONAL ORTHOPÆDIC HOSPITAL.—Operations, 10 A.M.
- MIDDLESEX HOSPITAL.—Operations, 1.30 P.M.; Saturdays, 2 P.M. Obstetrical Operations, Thursdays, 2 P.M.
- CHARING-CROSS HOSPITAL.—Operations, 8 P.M., and on Thursday and Friday at the same hour.
- ST. THOMAS'S HOSPITAL.—Operations, 1.30 P.M.; Saturday, same hour.
- LONDON HOSPITAL.—Operations, 2 P.M.; Thursday & Saturday, same hour.
- ST. PETER'S HOSPITAL, COVENT-GARDEN.—Operations, 2 P.M.
- SAMARITAN FREE HOSPITAL FOR WOMEN AND CHILDREN.—Operations 2.30 P.M.
- GREAT NORTHERN CENTRAL HOSPITAL.—Operations, 2 P.M.
- UNIVERSITY COLLEGE HOSPITAL.—Operations, 1.30 P.M.; Skin Department, 1.45 P.M.; Saturday, 9.15 A.M.
- ROYAL FREE HOSPITAL.—Operations, 2 P.M., and on Saturday.
- CHILDREN'S HOSPITAL, GREAT ORMOND-STREET.—Operations, 9.30 A.M. Surgical Visits on Wednesday and Saturday at 9.15 A.M.

## Thursday, September 1.

- ST. GEORGE'S HOSPITAL.—Operations, 1 P.M. Surgical Consultations, Wednesday, 1.30 P.M. Ophthalmic Operations, Friday, 1.30 P.M.
- UNIVERSITY COLLEGE HOSPITAL.—Operations, 2 P.M.; Ear and Throat Department, 9 A.M.

## Friday, September 2.

- ROYAL SOUTH LONDON OPHTHALMIC HOSPITAL.—Operations, 2 P.M.

## Saturday, September 3.

- UNIVERSITY COLLEGE HOSPITAL.—Operations, 2 P.M.; and Skin Department, 9.15 A.M.

## Notes, Short Comments &amp; Answers to Correspondents.

*It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.*

*All communications relating to the editorial business of the journal must be addressed "To the Editors."*

*Lectures, original articles, and reports should be written on one side only of the paper.*

*Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.*

*We cannot prescribe or recommend practitioners.*

*Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."*

*Letters relating to the publication, sale, and advertising departments of THE LANCET to be addressed "To the Publisher."*

*We cannot undertake to return MSS. not used.*

## THE STUDENTS' NUMBER.

WE beg to direct the attention of those Deans of Medical Schools and Secretaries of Hospitals who have not yet furnished us with the necessary information for our Students' Number to the announcement that the date of publication is September 3rd. It will be essential for particulars intended for publication in the Students' Number to reach THE LANCET Office not later than Tuesday, the 30th inst. Communications should be addressed to the Sub-editor, THE LANCET Office, Strand.

## A NEW SOURCE OF TITLES.

TITLES have generally proceeded from sovereigns, popes, universities, or other distinguished quarters; but some of our brethren in Victoria are impatient with the limitations and restrictions with which titles from such quarters are granted. The *Sydney Morning Herald* reports that at a meeting of the Victoria branch of the British Medical Association a motion was proposed that "as the title 'Dr.' by the custom of the people had become the recognised title of legally qualified practitioners in the colony of Victoria, the members of this branch consider it should be officially allowed to such practitioners." This resolution—the debate on which was adjourned—is scarcely worthy of the Victoria branch. The title "Dr." is applied to many other persons than medical practitioners. As far as it rests on the mere custom of the people as applied to medical men it needs no further recognition. It is generally used without distinction or reflection. It is not on such grounds that any grave change in the law of titles is to be advocated.

*P.R.C.S.*—We are of opinion that it would tell against our correspondent's own interests to send in an account to the body mentioned unless some intimation has been made that his charges would be met by them. If our correspondent can get someone to move in his behalf all well and good. Under the latter circumstances it is more than likely that a favourable consideration would be given to the matter. We cannot advise what the charges should be, but we may suggest that they should bear a proper relation to the class of patient attended.

## THE CAPE FOR PHTHISIS.

*To the Editors of THE LANCET.*

SIRS,—I am sending a young lady to winter at the Cape. She leaves at the end of September, and by force of circumstances she is obliged to travel alone, unless she could meet with any lady going out. Would any brother practitioner knowing of a lady who is going to the Cape kindly communicate with me? My patient is twenty-five years old, and a lady in every sense of the word. Further, would anyone better informed than myself tell me which is the best place in the Cape Colony for a patient threatened with phthisis? Indeed, any information will be most gratefully acknowledged.—I am, Sirs, yours truly,

G. HAY REYNOLDS, M.B.

9, Frogna, Hampstead, N.W., Aug. 23rd, 1892.

## THE POST OF PORT SURGEON AT ADEN.

WE have had an opportunity of perusing copies of a correspondence relative to a medical officer of the Bombay medical establishment having been superseded, without any reason being assigned, in the appointment of port surgeon of Aden, a post in which he had acted for three years. The medical officer very naturally appealed to the Government of Bombay through the head of his department, requesting that their decision in this respect might be reconsidered. To this official letter, forwarded through the proper channel, no reply of any kind has been given, which is, to say the least of it, of very unusual occurrence in official correspondence. It appears that the medical officer concerned took over charge of the duties of port surgeon at Aden in March, 1883, and continued to act in that appointment until April, 1886. During these three years he fulfilled the duties of his post efficiently and without unpleasant incidents, correspondences or friction of any kind. About the beginning of April, 1886, however, this officer forwarded a complaint from one of his hospital subordinates regarding the establishment of a house of ill fame at Steamer Point, in close proximity to the European General Hospital, where it was overlooked by the quarters of the apothecary and his wife, with a communication from himself in which he very properly called the attention of the political resident to the subject in terms befitting the nature of it. The reply to this was of an arbitrary kind, but the Political Resident subsequently visited the premises and the apothecary made good his complaint. The next step taken was the appointment of another officer to the post of port surgeon, and no explanation for the adoption of this course was or has ever been given, nor has any reply to the official protest against it been vouchsafed.

Mr. Charles Heves.—It would be better to apply directly to the various examining bodies for copies of regulations and for other information desired. We cannot assume the responsibility of answering the invidious questions asked.

## COMPENSATION TO MEDICAL WITNESSES.

To the Editors of THE LANCET.

SIRS,—As the question of compensation to medical witnesses is now receiving some public attention, I shall be obliged if you will allow me to place before your readers the particulars of a case which has recently occurred to me.

A few weeks since the superintendent of police in my district called upon me and brought with him a child ten years of age for examination, which child, it was alleged, had been violated. I made the required examination, and I was informed by the police officer that I would obtain a fee for so doing. A few days after he called again and asked me to write a full report of the condition of the child, for which, he said, I would receive a guinea. The case was then sent forward to the assizes, and I was summoned as a medical witness. The assize town is ten miles distant, and I had to drive there, and was kept on the day of trial from 10 A.M. until 5 P.M. The entire remuneration I was ordered by the Court for my first examination, my subsequent written report, and my attendance at the assizes amounted to a sum of £1 0s. When I returned home on the day of trial I had to drive some eight miles to see patients—cases of urgency—so that my day's work had not concluded until 1 A.M. the following morning. It seems hardly necessary for me to comment further on the inadequacy of the remuneration awarded to me in this instance to cover my time and the expense I had to incur; but I may say that in future any such cases should be brought to me by the police I shall, if I have the option, decline to do anything to do with them. I am, Sirs, yours faithfully,

August, 1892.

VICTIM.

## THE CAUSE OF QUACKERY.

A CORRESPONDENT of the *Sydney Morning Herald* discusses the cause and cure of quack doctors, of which he says there are more in Sydney than in all London. He has arrived at a singular conclusion—viz., that the reason why quacks abound is that medical men charge too highly for their advice and medicines. We gather from his letter that the lowest charge for a visit is half a guinea. It is always pleasant to conclude that you have discovered an explanation of a complicated fact, especially if it is simple and to be expressed in a single sentence. But such easy theories are always to be suspected. And we think this is the case here. Quacks are not so accommodating in their charges as regular medical men. It is notorious that the poor will find large sums to buy a quack medicine with or to pay a bonesetter, who would have no money to spare for a regular practitioner. Certainly this explanation will not hold in England, where there is plenty of quackery, impudent and costly, that claims pounds where practitioners would be content with shillings. There are quacks because people like to be promised impossible things in an impossible space of time.

Mr. George Foy will see that the report in question received detailed notice at our hands in last week's issue of THE LANCET.

## THE MORBUS PEDICULARIS IN ANTIQUITY.

NO one who has followed the successive revolutions in the history of medicine is likely to fall into the error into which the lay historian is so apt to be betrayed—the error, to wit, of assuming ancient disease, pathogenically and clinically, to be identical with its supposed modern equivalent. In many cases the resemblance between the two is superficial only, inasmuch that when we descend to symptoms we are often puzzled to imagine how the same name could be applied to both. We need not enter into the *quæstio vexata* of the memorable plague at Athens as described by Thucydides. From the features of it detailed by that prince of historians subsequent writers have been led to take widely divergent views as to its character—some identifying it as small-pox, others as typhoid fever, others, again, as plague as it is occasionally met with in the East. It never occurs to these ingenious speculators that the disease may have been *sui generis*, that it may have become worn out after successive visitations, and that in its *ensemble* it is not to be identified with any organic disorder known to modern classification. Similar reflections must occur to the medical reader when perusing the comments of nineteenth-century historians as to the disease which carried off the Dictator Sulla. The Elder Pliny—who, though not himself a professional physician, any more than Celsus, was yet intimately acquainted with the best authorities in medicine, past and contemporaneous—distinctly tells us: “*Phthiriasis Sulla Dictator consumptus est nascunturque in sanguine ipso animalia oxesura corpus.*” (Sulla, the Dictator, was consumed by the lousy disease. There are, indeed, generated in the very circulation of the human subject animalcules capable of devouring the body.) From all that we know of Sulla (from the celebrated Life of him by Plutarch in particular) we are prepared to find that his constitution was broken down by every kind of debauchery, the symptoms of gouty eczema, if not of a cutaneous appearance, suggestive of secondary syphilis, having been prominent in him at a comparatively early age. When we consider the active soldier's life he led—a life not always compatible with personal cleanliness—we are at no loss to conceive that the Nemesis of his debauched habits must have been reinforced by conditions favourable not only to maladies of the *cutis vera*, but to such of these as take the form of parasitic infection. The *pediculi corporis*, oviparous as they are, might have found in his artificially prepared system the very nidus best adapted for their development and multiplication, till they acquired such a foothold in the *cutis vera* as gradually to suspend its function and become the proximate cause of death. This very reasonable view of the case seems not to have been placed before Ihne or Mommsen, the historians of Ancient Rome, or, if placed before them, not to have been understood; and in their anxiety to whitewash the successful rival of the democratic Marius they ridicule the notion that he could have died of such a disease at all—a disease which, in the opinion of Mommsen, is “entirely imaginary.” Ihne is even more explicit, and while he says that “*phthiriasis* exists only in the brains of credulous writers,” he maintains that “Sulla died in consequence of the rupture of a bloodvessel brought on by the irritation he felt at the dishonesty of Granius.” “Rupture of a bloodvessel brought on by irritation” sounds very like the ecstatic etiology we had occasion to stigmatise in Sholley's account of the death of Keats. Much more likely to be true is the matter-of-fact statement of Pliny the Elder—a statement which Plutarch must have had every opportunity of sifting, and which harmonises with all we know of the Dictator's habits and of the undoubted recognition of phthiriasis itself in the Greek and Roman classifications of disease.

Cell.—Jervis on the Coroners Act, 1887, fifth edition, by Melsheimer, published by Stevens and Sons, 119, Chancery-lane, will, we think, afford our correspondent the information he requires.

W. M. M.—Our reply must be in the negative.

## “THE FLY PLAGUE.”

To the Editors of THE LANCET.

SIRS,—If “A Senior F.R.C.S.” sponges his face, neck and arms with a weak infusion of quassia he may sit under his fig-tree undisturbed by gnats *et id genus omne*. I have used this for several years, and find that no (English) insects will bite or even settle on a skin so protected. The sponge used need only be damp, not thoroughly wet, with infusion; but, of course, the skin must not be completely dried with a towel afterwards. I am, Sirs, yours faithfully,

Rugby, Aug. 23rd, 1892.

NORMAN DAVIS, M.D.

ERRATUM.—On page 444, column 2, of our last issue the heading, “Messrs. Lowtan and Sons, London,” should read Messrs. Cowtan and Sons.

# A PAGE FOR STUDENTS

## ON THE

# PROGRESS OF PHARMACY.

---

EVERY Student of Medicine who would ensure for himself that success in his professional career for which he hopes should be careful to take every advantage offered to him to cultivate his acquaintance with Pharmacy. Many distinguished members of the Profession have before now generously admitted the important part a firm and thorough grasp of Pharmacy has played in their successes, and have readily acknowledged the effective aid rendered by the pharmacist of to-day in the preparation and presentation of medicines. As a proof of the progress of Pharmacy the following will be interesting. At the twenty-ninth annual meeting of the British Pharmaceutical Conference held in Edinburgh a few days ago the President, himself an accomplished technologist, in a very able and most readable address—one of the most interesting addresses ever delivered from the chair—dealt with the many signs of progress to be marked around us. With the calm, discriminating eye of a real philosopher he looked out upon the world and scanned the busy hives of arts and manufactures, and noted the various improvements and developments. Addressing the most critical audience which, from a purely pharmaceutical point of view, could possibly be gathered together, the accomplished President dealt with the Progress of Pharmacy. He said:—

“Much progress in Pharmacy has marked our period. Many of us remember with a shudder the awful powder, the very thought of which haunted our young dreams, taken in some kind of jam, and which gave us a growing horror of that particular variety of preserve, which we have never got over. That does not represent the elegant Pharmacy of to-day, and our children can take it in a “*Tabloid*.” Much has been done and more will yet be done to make the administration of nauseous medicines agreeable.”

Everybody knows, who has any acquaintance at all with the latter developments of Pharmacy, that the “*Tabloid*” form is our own innovation, and is fully aware of the great advantages it offers in the accurate, systematic and effective administration of drugs. The fact that this triumph of modern Pharmacy was considered entitled to a special pronouncement by a learned president in an address to a learned and scientific association is a significant one, which carries its own moral. Praise uttered from such a position and to such an audience is praise indeed, and we value the compliment. While we gratefully acknowledge this recognition we do not rest upon our oars, though the flowing tide be with us. No; our energies are still bent in the direction of progress and improvement. The “*Tabloid*” form of compressed drugs is only one of our many successes which have received the unqualified approbation of the medical profession. As we have said, our motto still is “Progress,” and as soon as experiment and test have completed the evolution of one idea, another is handled and carried out. We watch the development of Medicine and Pharmacy in every country from which we can get reliable report, and we scan with careful eye the current literature which represents the latest doings in the clinic and in the laboratory; in fact, we adopt every possible measure which will ensure our products being up to date, and which will help us to maintain the position already accorded us of being thoroughly progressive.

TIONS of the Cor-joint Board in England and for the Fellowship of the College of Surgeons, with Examination Papers. Sixth Edition, Revised and Enlarged. Price 6s. net.

### Peddie's Manual of Physics, pro-

fusely Illustrated, crown 8vo, 500 pp., price 7s. 6d.

"Extremely useful, as it covers an extent of ground taken up by no other text-book that we know of."—THE LANCET.

"Peddie's manual is both up to date and complete in mathematical proofs, and as simple as possible."—BRITISH MEDICAL JOURNAL.

### Text-book of Naked-eye

ANATOMY. By JAS. CANTLIE, M.B., F.R.C.S. Bound half-calf, superbly illustrated with 113 Steel Plates. The only anatomy extant which is illustrated with steel plates. Price—plain, 25s.; or hand-coloured, 50s. [Price List Book.]

### The Pocket Gray, or Anatomist's

VADE-MECUM. From the works of Gray, Ellis, Holden, and Leonard. By E. COTTERELL, L.R.C.P., M.R.C.S. Enlarged Edition, 3s. 6d.

"A marvellous amount of information condensed into a remarkably small space."—MED. PRESS.

### Ewart's How to Feel the Pulse

and WHAT TO FEEL in it. Practical Hints for Beginners. Illustrated. Price 3s. 6d.

### Ewart's Cardiac Outlines for

CLINICAL CLERKS and PRACTITIONERS; and First Principles in the Physical Examination of the Heart for the Beginner. 62 Illustrations and separate gummed Diagrams. Price 5s. 6d.

### Brand's Pocket Case-book for

PRACTITIONERS and STUDENTS; with suggestions for Note-taking, Ruled Sheets, Diagrams, Temperature and Pulse Charts. Cut Index, &c. Leather, price 4s.

### Jones's Diseases of Women and

UTERINE THERAPEUTICS. 704 pp., with 400 Illustrations, Fifth Edition. Price 10s. 6d.

"A storehouse of the most modern treatment for the practitioner."—THE LANCET.

"The work of a mature and experienced authority."—BRITISH MEDICAL JOURNAL.

## ADDRESS TO MEDICAL STUDENTS.

HOWEVER high may be the standard of professional learning and conduct at which those who are about to commence the study of medicine should be exhorted to aim, it must not be forgotten that the primary objects of medical students in the acquisition of knowledge are to pass their examinations at the proper time and to be able to gain their living as honourable and capable practitioners of the healing art. The former is a duty which they owe alike to their friends and to themselves: to their friends especially by reason of the outlay on their education, which presses severely upon those who have experience of the *res angusta domi*; and to themselves because frequent failure often terminates either in their having to earn their livelihood in the undesirable capacity of unqualified assistants or in an inability to earn a livelihood at all. Doubtless the successful attainment of the end in view will depend mainly upon the exertions of the students themselves, but the kind and the degree of success will be determined also by the exercise of forethought on the part of their friends and sound judgment in selecting the most favourable fields for prosecuting the campaign. A preliminary survey of the whole ground to be occupied, a careful and complete study of the regulations of the universities and licensing bodies and of the advantages offered at each stage of the student's career by the various medical schools, coupled with the advice of friends well qualified to judge, should precede the first stage of the student's career. At the present day, when the possession of a university degree is regarded as a highly desirable acquisition for the medical practitioner, this forethought and prevision are all-important for students whose medical education is to be obtained in the metropolis. We have known men, who would have greatly distinguished themselves at the severe examinations of the University of London and who might have occupied leading positions, to be debarred from rising to their proper place in the profession because their knowledge of examining bodies and examinations was acquired when circumstances rendered it too late to remedy the omission. A young man who is just leaving a good school ought not to find it a difficult task to pass the Matriculation Examination at the University of London, and this course, under present circumstances, cannot be too strongly urged upon those who are intending to complete their whole curriculum in a London school. Before the extension of the period of professional study from four to five years, the most advantageous course was to pass both the Matriculation and the Preliminary Scientific Examinations of the University before entrance at the medical school; for it was found that preparation for the latter clashed with the ordinary professional curriculum, and failure at this examination—the *pons asinorum* of the ambitious student—resulted in an absolute loss of the time which had

N<sup>o</sup> 3601

been devoted to the work. The addition of the extra year of study which has become obligatory on every medical student who commenced his medical studies after Jan. 1st, 1892, tends to harmonise the curriculum for the diplomas of the corporations with the curriculum for the University of London, and ought to facilitate the acquisition of medical and surgical degrees at that University. The first year of the five years may be passed at a university or teaching institution recognised by any of the licensing bodies where the subjects of physics, chemistry and biology are taught. It would be too sanguine to anticipate that these regulations will altogether meet the demand for increased facility of medical graduation in London, but it must assist in lessening the disabilities of the London students and remove one of the stumbling blocks which have been lying in their path. The question of a proposed Teaching University in London is fully dealt with in another part of our present issue.

We may avail ourselves of this opportunity to point out that some of the prospectuses of the medical schools contain all the information which the intending student requires in regard to examinations, diplomas, and degrees, coupled with very useful advice as to the order and methods of medical study. Application may therefore be made to every medical school for a prospectus. Moreover, at almost every school there is someone—be he dean or warden—who may be consulted, who is ready to smooth the path of the student, to make the crooked ways straight and the rough places plain. Within the space at our disposal it is impossible to touch upon the many subjects of interest which are suggested by the entrance of many hundreds of students on Oct. 1st upon the business and work of a lifetime, or to offer all the counsel which so grave and important an occasion demands. A few points only in connexion with the duty of preparation for examinations and for practice can here be noticed.

As lectures are indispensable, owing to the regulations of the licensing bodies, the student should attend them heartily and in earnest, supplementing the lecture of the day with the perusal of his notes and the subject of the lecture in his text-book. The mastery of one good text-book is better than desultory consultation of many authorities; but on disputed points and matters on which recent research has thrown new light the text-book may not contain all that is required. Some of the deficiencies may be made good by reference to current medical literature, by studying the reports of the medical societies, and by conversation with medical tutors, registrars, or members of the staff, or the lecturers themselves. It is a great art to obtain information by judicious questions, although the Socratic method cannot always be adopted without earning for the student the character and penalties of a bore.

Reading should be supplemented with the book of nature, some pages of which will be open in every well-stocked museum, and if the museum of the medical school does not suffice, the museum of the Royal College of Surgeons presents ever-increasing facilities for objective study.

Regular work should be undertaken daily. The practice of LINNÆUS in regard to his *magnam opus—nulla dies sine linea*—furnishes a good example of the efficacy of a little labour regularly performed. It is continual dropping that wears away the stone—*gutta cavat lapidem non vi sed sæpe cadendo*. Of all the qualities which contribute to command success

self-reliance is one of the most important. The most successful men have been the most self-reliant. The maxim of HORACE not to pin's one faith on anyone—*nullius in verba magistri*—is a branch of the self-reliant spirit. There is often on a medical or surgical staff some brilliant man—a favourite and successful because a dogmatic teacher, a man distinguished as a clinician or an operator, prone to enunciate theories and fond of philosophising—who gains the ear of the students. For a time, perhaps, every word is received as gospel and all his maxims and methods of practice are regarded as the source of all professional wisdom—the only true maxims and only right methods. The student knows not that there may be many equally good ways of arriving at the same result, and it is only time or some error on the part of the idol which cannot be concealed that occasions his disenchantment. To avoid these snares the student should listen to more than one oracle and witness a variety of practice. Let him learn the views of different physicians and different surgeons, and be in constant attendance both among in-patients and out-patients. Let him prove all things and hold fast that which is good. And with regard to practice, that which is equally necessary for success at examinations and in future practice is for students to perform for themselves all the minutiae of work at the bedside, all the steps of operations, each detail in minor surgery. These things must be done until the habit of doing them well comes mechanically. There is a great gap between a most perfect knowledge of every step in an operation and the power of doing them smoothly, successfully and without effort. Constant practice abolishes effort. To have to stop and think at each step of a surgical procedure is always necessary for anyone who has not enjoyed a sufficiency of practice. Equally for rapid and successful diagnosis constant and abundant practice can alone be of avail, and the rapid and successful diagnosis then begins to wear the aspect of inspiration and intuition. Another reason for the student's perfecting himself in all minor details of medical and surgical practice is this, that it will be the minor cases of which his private practice will be the most largely composed and which will be the foundation of his repute and fortune. Minor surgery will be far more useful to the general practitioner than the major operations. There will be many cases of *nævi*; many cases will require catheterism; the arrest of epistaxis will be urgent; many hydroceles may require tapping; but how few limbs will require amputation and how few arteries will have to be tied in their continuity. Not that the student should neglect his opportunities of witnessing and doing these great things; by all means let students flock to the theatre for an amputation at the hip or an entire upper limb, but let them never lose a chance of doing for themselves the minor details on which their daily bread may depend. In all practice it must be recollected that our primary duty is to save life or to prolong it. To save life we must be able to act in emergencies with promptitude and decision. Every practitioner should be able to arrest hæmorrhage in any part of the body, on an emergency to operate for hernia or intestinal obstruction, and to open the trachea or larynx—it may be with a penknife—to overcome a stoppage to respiration. In these respects—and fortunately in others—the interest and advantage of patients and practitioners will go hand in hand, although the gratitude of patients is not,

we regret to add, invariably proportionate to the amount of good which the practitioner has done.

We must now for a time take leave of those who are crossing the threshold of professional work. All of them are looking forward to what the future may bring. To some may come fame, to some success, to some perhaps only a mere hardly earned livelihood, to some, alas, perhaps nothing but disappointment and failure—still to all we would say, "Do your best."

"Who does the best his circumstance allows  
Does well, acts nobly: angels could no more."

#### THE PROPOSED NEW TEACHING UNIVERSITY IN LONDON.

IN our Students' number of 1891 we expressed a hope that before another year had elapsed a Teaching University for London would have been established and that London medical students would have been placed in such a position through its formation that they would be able to obtain degrees on the same fair and equitable terms as are now granted in the other great centres of medical education in Great Britain. We regret to say that we have been disappointed in this expectation, and London students must still go through the ordeal of an honours' examination although they only wish to obtain an ordinary pass degree. The first Royal Commission definitely laid down in its report that this was the practical outcome of the present high standard insisted on by the University of London, and suggested a scheme for the removal of such an anomaly. During the summer session of 1891 the Lords of the Privy Council actively concerned themselves with the question of providing a real University, and not a mere Imperial examining board, in London, in consequence of the failure of the University of London to adapt itself to the new position which the Royal Commission recommended and to make the necessary changes in its constitution and working. As the outcome of their deliberations a Draft Charter for a new University, to be called the Albert University, which should include King's and University Colleges, and the London Medical Schools, with power to admit other institutions of a similar standing, and this was sanctioned both by their lordships and by the law officers of the Crown. In order to become valid this Charter had to be laid on the table of both Houses of Parliament for thirty days, and on their reassembling in February last this step was complied with, permission in the meanwhile having been granted for a change of name from "Albert" to "Gresham." But during the Parliamentary recess a very formidable opposition had arisen to the scheme approved by the Lords of the Privy Council. The authorities of the Victoria University and of the provincial Schools of Medicine had not opposed the petition of King's and University Colleges to be constituted into a University for London, but they immediately changed their attitude and became actively hostile when the other medical schools in London were included and so took every means to prevent the Charter being passed through the House of Commons. For diverse reasons many of the Senate and a large number of the members of Convocation of the University of London, the authorities of Bedford College and other institutions, such as the Working Men's College and the Birkbeck Institution, joined in the opposition, and to these were added the objections of

many interested in higher education in London—i.e., the University Extension Society and some of the professors in Arts and Science in University College. Those who were interested in University Extension demanded a democratic University, whilst the professors asked for one which should be under their own control, and by which all other teaching institutions of the higher grade in London should be absorbed, and, notwithstanding discordant views, all these elements were joined together in opposition. A deputation representing these various bodies waited on Lord SALISBURY on March 3rd, and although he pointed out that their objections were being made at a very late stage, and that they should have been placed before the Privy Council at the hearing of the application for the Charter, it was clear that the Government would have to give way to the Parliamentary opposition. Time did not permit the supporters of the Charter to reply publicly and effectively to the attacks made by the objectors, although many of the statements put forward in the name of the provincial medical schools were unwarranted. On March 9th Mr. BALFOUR announced that the Government had decided to remit the Draft Charter for reconsideration, and on April 25th another Royal Commission was nominated. The effect of the past agitation in favour of a Teaching University which should have power to confer degrees on London students on equitable terms will be best seen on comparing the terms of the reference to the two Royal Commissions. The first Commission in 1888 was appointed to inquire "whether any and what kind of new University or powers is or are required for the advancement of higher education in London"; whilst the new Commission is authorised "to consider, and if they think fit, alter and amend, and extend the proposed Charter remitted in compliance with an address of the House of Commons, so as to form and report to us a scheme for the establishment under Charter of an efficient Teaching University for London." The advance in the latter reference is obvious: the first Commission was to report as to the necessity for a Teaching University for London; the present Commission is to alter, if necessary, the provisions of a Draft Charter and to recommend a scheme for establishing the University. This is at least something gained. No one denies the necessity for such a University, the difficulties are in the devising of a proper and efficient plan for its formation and growth, and the new Commission is to alter the Gresham Charter so as to make it a fit basis for the establishment of a real working University for London. The second Commission includes no member who served on the former one, and is constituted on an altogether different plan. Instead of consisting of uninterested persons eminent in the knowledge of law and of long experience in University education, as was the case in the Commission of 1888, that of 1892 is mainly composed of representatives of nearly all the bodies who have taken part in the movement, and it is to be hoped that they will be able to come to some agreement, and that an efficient and practical scheme will be forthcoming. The members are Earl COWPER, the chairman, who has no special interest in the question; Lord REAY, intimately connected with University College, and the first chairman of the Association for Promoting a Teaching University; Bishop BARRY, a member of the Council of King's College, and formerly its Principal;

LORD PLAYFAIR; Vice-Chancellor RENDALL of the Victoria University; Professor RAMSAY of Glasgow; Professor SIDGWICK of Cambridge; Canon BROWNE, a most ardent supporter of the University Extension system; Mr. JAMES ANSTIE, a member of the Senate of the University of London, who has had a considerable part in drawing up many of the schemes for reforming that University; Mr. R. C. PALMER, a most influential member of the Gresham Committee and of the Mercers' Company; whilst Sir W. S. SAVORY, Sir G. M. HUMPHRY and Professor BURDON-SANDBERSON are the representatives of the medical profession, but they may be considered as representing respectively the Royal Colleges and the medical schools of Cambridge and Oxford rather than the medical profession in its wider aspects.

There are two very important omissions in the *personnel* of the Commission; for the teachers, who are not specially connected with either the Royal Colleges or the Universities, and to whom the present forward position of the question is largely due, are not represented, nor is there included any general medical practitioner (and there would have been no difficulty in finding a suitable representative) who has been taught in one of our London medical schools, and who would therefore have been practically conversant with the advantages and disadvantages of the London system of education and qualification whilst free from any official bias.

The sittings of the Commissioners began on May 21st, and on the 28th they heard the first witnesses. It was decided that, so far as might be convenient, those who opposed the Gresham Charter should first be heard. The sittings are held in private. A large number of witnesses have given evidence, which was until very recently devoted mainly to the general educational questions that required solution in the event of the formation of such a University in London. It was not until the middle of July that the medical difficulty came to the front, and this was soon found to be the really crucial part of the investigation. The real point to be determined is the formation of a Teaching University in London, which among its other objects should include in its constitution a medical faculty strong enough to secure for its students degrees on a fair standard of literary, scientific, and professional knowledge, with a firm insistence on proofs of due attendance on the theoretical teaching and an efficient service in the practical work laid down in the medical curriculum. Other questions—such as the amalgamation of schools for more efficient scientific teaching, the appointment of special professors of University standing for higher teaching or for research, the existence of one or two Universities in London the position of the Royal Colleges in connexion with the University—although of great importance, are quite subsidiary to the main question. The acknowledged injustice in the present position of the London student must be removed, and any scheme, however comprehensive in its other educational details and suggestions, which does not make this a prominent feature must fail. There would seem to be only two possible solutions of the difficulty. The first is to make a new attempt at remodelling the existing University, so as to practically secure the advantages of a local Teaching University with degree-granting powers on the one side and the existence of an open and Imperial Examining Board, also conferring degrees, on the other. We have heard a rumour that many members of the Royal Commission are in favour

of some such plan. It must be remembered, however, that the former Commission suggested a similar solution, and put forward a detailed scheme for its effective working, but after two years had been spent in conferences and negotiations the University of London found itself unable to so transform its constitution as to assume the new position and carry out the new duties recommended by that Commission. It has been suggested that if a similar scheme be recommended by the present Commission any anticipatory opposition in Convocation will be rendered nugatory by making an application direct to Parliament without consulting the members of Convocation. Such a high-handed method of procedure may be contemplated, but we do not believe that the Senate as a body will give its sanction to such a course of proceeding, and we are by no means sure that even if adopted it would necessarily be successful. The other method of meeting the difficulty is to form a second University in London with exclusively local functions, and to allow the existing University to remain free and unfettered for the performance of its present Imperial work. The existence of Trinity College, Dublin, having power to confer degrees on its own students, and of the Royal University of Ireland with its headquarters in Dublin, show how easily two Universities, with different objects and functions, can exist side by side in the same city.

#### THE STUDENT'S LIBRARY.

The number of works on medical subjects which are available to the English student has become so large, and their general quality is so excellent, that it is a matter of increasing difficulty to make any attempt to indicate the most serviceable text-book in any branch. For some years past we have endeavoured to make such a guide by taking the leading examinations as the basis of our comments, and pointing out some of the chief text-books that may be read in preparation for these examinations. But for the reason above stated this mode of dealing with the matter has the objection of making a somewhat invidious selection, and in what follows we propose merely to arrange in systematic fashion most of the publications now in vogue, under each subject of the curriculum, placing first the larger and more compendious treatises, and indicating by an asterisk those books which have perhaps the greatest favour among students at large.

#### ANATOMY.

*Quain*.—Elements of Anatomy, edited by Schäfer and Thane (Longmans, Green and Co.).

*Macalister*.—Human Anatomy, Systematic and Topographical (Charles Griffin and Co.).

\**Gray*.—Anatomy, Descriptive and Surgical, edited by Pick (Longmans, Green and Co.).

\**Ellis*.—Demonstrations of Anatomy, edited by Thane (Smith, Elder and Co.).

\**Heath*.—Practical Anatomy, edited by Godlee (J. & A. Churchill).

*Holden*.—Manual of Dissections, edited by Langton (J. & A. Churchill).

*Cleland*.—Directory for Dissection (Smith, Elder and Co.).

*Clarke and Lockwood*.—The Dissector's Manual (Cassell and Co.).

*Cunningham*.—Dissector's Guide (J. Thin).

\**Cooke*.—Tablets of Anatomy (Longmans, Green and Co.)

*Treves*.—Surgical Applied Anatomy (Cassell and Co.).

*Bollamy*.—Guide to Surgical Anatomy (J. & A. Churchill).

\**Holden*.—Landmarks, Medical and Surgical (J. & A. Churchill).

#### OSTEOLOGY.

\**Ward*.—Outlines of Osteology (Henry Renshaw).

\**Thane*.—See Quain's Anatomy, vol. ii., part 1.

\**Holden*.—Human Osteology, edited by Stewart (J. & A. Churchill).

*Norton*.—Osteology for Students (Baillièrre, Tindall and Cox).

\**Ellis and Ford*.—Illustrations of Dissections (Smith, Elder and Co.).

*Braune*.—Atlas of Topographical Anatomy (J. & A. Churchill).

\**Godlee*.—Atlas of Human Anatomy (J. & A. Churchill).

*Masse*.—Text-book and Atlas of Anatomy (Baillièrre, Tindall and Cox).

*Withowski*.—Movable Atlas of Anatomy (Baillièrre, Tindall and Cox).

#### PHYSIOLOGY.

*Landois*.—Text-book of Physiology, translated and edited by Stirling (Charles Griffin and Co.).

\**Foster, M.*—Text-book of Physiology (Macmillan and Co.).

*Carpenter*.—Principles of Physiology, edited by Power (J. & A. Churchill).

*McKendrick*.—Outlines of Physiology (Maclehose and Sons).

*Plint*.—Text-book of Human Physiology (H. K. Lewis).

*Hermann*.—Elements of Human Physiology, translated by Gamgee (Smith, Elder and Co.).

\**Kirkes*.—Handbook of Physiology, edited by M. Baker (John Murray).

*Yeo, G.*—Manual of Physiology (J. & A. Churchill).

*Power*.—Human Physiology (Cassell and Co.).

\**Qualey*.—Elementary Physiology (Macmillan and Co.).

#### PRACTICAL PHYSIOLOGY AND PHYSIOLOGICAL CHEMISTRY.

*Gamgee*.—Physiological Chemistry (Macmillan and Co.).

*Halliburton*.—Text-book of Chemical Physiology and Pathology (Longmans, Green and Co.).

*Charles*.—Elements of Physiological and Pathological Chemistry (Smith, Elder and Co.).

\**Harris and Power*.—Physiological Laboratory (Baillièrre Tindall and Cox).

#### HISTOLOGY AND EMBRYOLOGY.

\**Schäfer*.—Quain's Anatomy, vol. i., parts 1 and 2.

*Klein*.—Atlas of Histology (Smith, Elder and Co.).

*Stirling*.—Text-book of Practical Histology (Smith, Elder and Co.).

\**Schäfer*.—Course of Practical Histology (Smith, Elder and Co.).

\**Klein*.—Elements of Histology (Cassell and Co.).

*Colman*.—Section Cutting and Staining (H. K. Lewis).

#### MATERIA MEDICA.

*Brunton*.—Text-book of Pharmacology, Therapeutics, and Materia Medica (Macmillan and Co.).

*Phillips*.—Materia Medica and Therapeutics (J. & A. Churchill).

\**Garrod*.—Essentials of Materia Medica and Therapeutics, edited by Tirard (Longmans, Green and Co.).

\* *Whitla*.—Pharmacy, Materia Medica and Therapeutics (Henry Renshaw).

\* *Mitchell Bruce*.—Materia Medica and Therapeutics (Cassell and Co.).

\* *Roberts*.—Official Materia Medica (H. K. Lewis).

*Hale White*.—Materia Medica, Pharmacology and Therapeutics (Macmillan and Co.).

*Thorowgood*.—Guide to Materia Medica and Therapeutics (J. & A. Churchill).

*Griffiths*.—Materia Medica and Pharmacy (Baillière, Tindall and Cox).

*Soorobly Jackson*.—Note-book of Materia Medica (J. Thin).

#### Therapeutics.

*Brunton*.—Text-book of Pharmacology, and Therapeutics (Macmillan and Co.).

\**Leishman.*—System of Midwifery (Maclehose and Sons).

\**Galabin.*—Manual of Midwifery (Henry Renshaw).

*Meadows.*—Manual of Midwifery (Henry Renshaw).

## GYNÆCOLOGY.

*Barnes.*—Medical and Surgical History of Diseases of Women (J. & A. Churchill).

\**Hart and Barbour.*—Manual of Gynæcology (W. T. A. K. Johnston).

*Atthill.*—Lectures on Diseases of Women (Longmans, Green and Co.).

*Edis.*—Diseases of Women (Smith, Elder and Co.).

*Jones, M.*—Manual of Diseases of Women (Baillièrè, Tindall and Cox).

\**Galabin.*—Guide to Diseases of Women (J. & A. Churchill).

\**Lewers.*—Text-book of Diseases of Women (H. K. Lewis).

## DISEASES OF CHILDREN.

*Eustace Smith.*—Disease in Children (J. & A. Churchill).

\**Ashby and Wright.*—Diseases of Children (Longmans, Green and Co.).

\**Goodhart.*—Manual of Diseases of Children (J. & A. Churchill).

*Money.*—Treatment of Diseases of Children (H. K. Lewis).

## THE VALUE OF DEBATING SOCIETIES.

EARLY in his curriculum the medical student should join the debating society attached to his school, and this for many reasons. It brings him into contact, not merely social but intellectual, with the more advanced of his fellows, and it stimulates him by honourable emulation to earn their

approval and esteem. It may be that for the first year or so he takes no prominent part in the discussions. The subject-matter of debate may be "over his head," or he may be shy as to addressing an audience, or a capacity of readily expressing himself may as yet have had no opportunity of development. For the time, therefore, he will be well employed in listening and looking on, till he feels sure of his ground and can intervene effectually in the proceedings. But when this latter stage is reached he will be spurred to greater efforts by the mental fascination inseparable from all high-toned discussion; he will find his intellect clearing itself in the endeavour to make his argument intelligible and convincing; and he will gradually refine and enrich his language in giving expression to subtler and ampler ideas. All this is a great moral and intellectual gain, which can react for nothing but good on his subsequent career—a gain perceptible subjectively as regards self-reliance, respect for the opinions of others and courtesy towards opponents, and objectively as regards the friendships it helps to form, the goodwill and even admiration it may bring him and the social vantage-ground on which it will serve to place him. So rich, indeed, are debating societies in these results for their members that no school—certainly no medical school—should be without one, while their opportunities should be freely utilised wherever such an adjunct to academic culture exists.

A very interesting book has lately appeared which gives point to the above remarks. It is a handsome volume published by Mr. DAVID DOUGLAS of Edinburgh, entitled "Dissertations by Eminent Members of the Royal Medical Society." Its editor is Sir DOUGLAS MACLAGAN, and its contents throw light on the first beginnings of the career of men afterwards distinguished in every walk of the profession. For more than a century and a half the Royal Medical Society of Edinburgh has enrolled in its membership the flower of the northern alumni, and a brief statement of its constitution and mode of working cannot but be useful for comparison or imitation. It is open to the first year's student and to the graduate, and after proposal and ballot the candidate takes his seat as an ordinary member. He is bound to attend the meetings, and is fined for absence so long as he resides in Edinburgh. After a time, varying according to the number of those who have preceded him in election, he is called upon to read to the Society an essay on some subject connected with the healing art or some of the ancillary sciences, and this is called his dissertation. The essay is criticised by the members, and, as Sir DOUGLAS MACLAGAN says, "has on many occasions given rise to debates which have had an important effect in extending the knowledge and influencing the future opinions and practice of those who have had the benefit of hearing or taking part in them. The member," adds Sir DOUGLAS MACLAGAN, "who has read the dissertation, and almost of necessity taken part in the discussion thereof, is entitled to become an extraordinary member and is now freed from compulsory attendance and fines."

A glance at the list of even those under whose names no dissertations are to be found may give some notion of the distinction of the Society. Such names include WILLIAM CULLEN, JOSEPH BLACK, HALLER, the MONROS, OLIVER GOLDSMITH, MARK AKENSIDE, MUNGO PARK, SIR CHAS. HASTINGS, THOMAS ADDISON, and CHARLES

DARWIN. On the other hand, the authors of the dissertations that compose the present volume would of themselves have given *éclat* to any society of the kind. They are DANIEL RYTHERFORD, JAMES GREGORY, GILBERT BLANE, ROBERT JAMESON, HENRY HOLLAND, RICHARD BRIGHT, MARSHALL HALL, ROBERT LISTON, JAMES SYME, ROBERT CHRISTISON, WILLIAM SHARPEY, ALLEN THOMSON, JAMES YOUNG SIMPSON, JOHN REID, MARTIN BARRY, WILLIAM BENJAMIN CARPENTER, JOHN BROWN, JOHN GOODSIR, CHARLES MURCHISON and JAMES MATTHEWS DUNCAN. The first essays of these men, as now given to the world, "form," as Sir DOUGLAS MACLAGAN says, "important additions to the history of medicine—a study too much neglected." More than this, they give conclusive evidence of the disciplinary and educative value of medical debating societies at that stage of the student's career when his mental faculties are in a state most favourable for the reception of impressions which may modify his whole future character and individuality.

#### BRITISH QUALIFICATIONS ABROAD.

As a very considerable number of medical men for one reason or another decide to leave these islands and to settle in practice in some other country, and as the conditions under which men holding British qualifications are permitted to practise differ widely in different countries, it will be useful to give in the present issue of THE LANCET an epitome of such information as we have been able to obtain concerning the regulations in force in various countries. It will be remarked that in British colonies generally little difficulty need be anticipated beyond having to furnish proof of the possession of a *bonâ-fide* diploma entitling the holder to registration in Great Britain and perhaps the payment of a fee. To this rule there are, however, as will be seen, exceptions—viz., British Columbia and Ontario, where an examination is necessary. It must be remembered, however, that these regulations are constantly changing, and generally in the direction of increased stringency, so that any practitioner thinking of settling abroad would be well advised to write direct to the authorities of the country or State to which he proposes to go for the latest information. It is well, too, to get diplomas and certificates of registration endorsed by the consul in England before sailing. This will sometimes obviate difficulties as to identification.

#### BRITISH COLONIES.

*Antigua.*—No formality is required.

*Australia.*—In all the Australian colonies the Medical Board must be first communicated with and the diplomas produced. It is generally necessary also to produce some evidence that the applicant for registration is really the person referred to in the diplomas, and the Board may take means of satisfying itself on this point. There is in some of the colonies a fee of £1 1s. to pay. In Western Australia the Board may examine and register an unqualified man.

*Barbadoes.*—Application has to be made to the Medical Assessors. Fee 5s.

*Bermuda.*—The Governor in Council gives permission to practise on the production of diplomas. There is no fee.

*British Columbia.*—Diplomas have to be produced to the Medical Council, Victoria, with satisfactory proof of identification, and an examination must then be passed in:

(1) Anatomy, (2) Chemistry, (3) Physiology, (4) Pathology, (5) Materia Medica, (6) Medical Jurisprudence, (7) Theory and Practice of Medicine, (8) Clinical Medicine, (9) Surgery, (10) Clinical Surgery, (11) Obstetrics and Diseases of Women and Children. Candidates must obtain 75 per cent. of the marks in each of the last three subjects. A fee of \$100 is required before the examination, half of which is returned in case of failure. Examinations are held in January, May and September.

*British Guiana.*—Application has to be made to the Secretary of the Medical Board. Qualifications which have not been registered in Great Britain may be recognised.

*British Honduras.*—No formality is required.

*Cape of Good Hope.*—The Colonial Medical Committee examines the diplomas of applicants. The Colonial Secretary will then grant a licence to practise. There is no fee.

*Ceylon.*—Practice is free.

*Dominica.*—No formality is required.

*Gibraltar.*—Diplomas must be produced to the Governor. There is no fee.

*Grenada.*—Application has to be made to the Clerk of the Colonial Secretary. There is then a delay of a fortnight. The fee is £1.

*Hong-Kong.*—The Medical Board examines the qualifications of applicants. A declaration has to be made before a magistrate. The fee is \$5.

*India.*—Practice is free.

*Jamaica.*—The Registrar-General acts as Medical Registrar. A declaration has to be made before a Justice of the Peace, and the diplomas are initialled by him. The fee is £1. Unqualified persons can be examined by the Medical Council. Fee £11 11s.

*Malta.*—A fee is necessary.

*Manitoba.*—Application should be made to the Registrar of the College of Physicians and Surgeons. The fee is about \$5.

*Mauritius.*—No fees are required.

*Natal.*—There is a Medical Board, to which body application must be made and a copy of a declaration before a magistrate produced. The fee is £1 15s.

*New Brunswick.*—The Council of Physicians and Surgeons are applied to and the diplomas and certificate of registration in Great Britain submitted to them. A fee of \$10 is charged.

*Newfoundland.*—No restrictions.

*New Zealand.*—There is no Medical Board here. The official to whom application must be made is the Registrar of Births, Marriages and Deaths of any of the chief towns. The diplomas must be produced, and a copy certified to by a Justice of the Peace must be left with him. An advertisement must also be inserted in the *New Zealand Gazette*. The fees amount to £1 5s.

*Nova Scotia.*—Application has to be made to the Provincial Medical Board, Halifax, and proof of registration in Great Britain presented. The fee is \$25.

*North-West Territory.*—The Lord Lieutenant is Registrar. Fee \$5.

*Ontario.*—Diplomas have to be presented to the Royal College of Physicians and Surgeons, Toronto, and an examination passed. The fee appears to be \$50. There is also a small annual subscription.

*Prince Edward's Island.*—The Board of Examiners examine the diplomas and charge a fee of 30s.

*Quebec.*—Practitioners must become members of the College of Surgeons and Physicians. No examination is required from holders of a British qualification. There appears to be a fee of \$20 and an annual payment of \$2.

*Sierra Leone.*—Practice is free.

*Straits Settlements.*—Practice is free.

*St. Lucia.*—Application has to be made to the Chief Clerk in the Government Office. There is no fee.

*St. Vincent.*—Application has to be made to the Registrar of the Medical Board. Fee £5.

*Tasmania.*—Here there is a Court of Medical Examiners, whose duty it is to examine the diplomas of applicants. The fee is not mentioned in the statute.

*The Bahamas.*—No formality is required.

*Tobago.*—No formality is required.

*Trinidad.*—The Secretary and Treasurer of the Medical Board act as Registrar. Applicants have to prove their qualifications, and also to show that they bear a good character. All registered persons are members of the Medical Board. There is no fee.

#### FOREIGN COUNTRIES.

Turning now to the question of practice in foreign countries, it must of course be evident that in them more difficulties are likely to be thrown in the way of a British practitioner than in the colonies. Indeed, in the majority of the more important countries an examination of a tolerably strict character has to be passed before applicants, however well qualified, can obtain leave to practise.

*Argentina.*—A severe examination, conducted in the Spanish language, must be passed at one of the two medical schools, Buenos Ayres and Cordova. It is said that at the latter school the scientific requirements are lighter, but the fees heavier, than at the former, where they amount to \$350 paper currency. Before passing the examination a foreign medical man may, if he pleases, obtain without difficulty a temporary licence to practise in some locality where there is no fully licensed practitioner.

In *Austria* it is necessary not merely to pass the examinations for the degree of Doctor of Medicine of an Austrian University, but to become an Austrian subject. Practically speaking, Austrian territory, which of course includes the Tyrol, seems to be shut off from foreign practitioners. One case has occurred where an Englishman who was engaged as surgeon to some works where a number of English were employed was allowed to pass an examination by means of papers which were translated.

In *Belgium* the Government is authorised, on the advice of a jury, which has the power of granting the diploma of Doctor or Pharmacist, to give permission to applicants who have obtained a diploma abroad entitling them to practise in their own country, but no permission can be given to practise medicine unless the original diploma authorises the holder to practise medicine, surgery and midwifery.

*Bolivia.*—There appears to be no examination. There is a medical faculty in the University of Sucre.

*Brazil.*—An examination has to be passed, but it may be conducted in Portuguese or French. It is said to be less severe than some of the other South American examinations.

There are faculties of medicine in Rio de Janeiro and Bahia. The recent political troubles may possibly have produced some change in the medical requirements.

*Chile.*—A severe examination must be passed, conducted in the Spanish language, in the University of Santiago. The examiners are mostly Germans and the requirements are, as nearly as possible the same as those of the German *Staats-examen*.

*Colombia.*—There appears to be no examination. There is a medical school in the University of Bogotá.

*Costa Rica.*—No formalities required.

*Dutch Guiana.*—A State Examination, as in Holland, is required.

*Ecuador.*—No requirements.

In *France* a Bill has passed through the French Legislature that entails considerable changes in the regulations regarding the granting of licences to foreigners to practise. The diploma of *Officier de Santé*, which is that which has been most commonly taken by English practitioners, is abolished, and all foreigners, whatever may be their diplomas, are obliged to pass the examinations and to go through part of the course of study required for the M.D. degree, which is said to be as difficult as the M.D. of London.

*French Guiana.*—The medical laws are analogous to those in France.

In *Germany* the State Examination, which is severe, must as a rule be passed. Occasionally exemption may be obtained.

In *Greece* there is an examination, but it may be passed in English or French.

*Guatemala.*—No requirements. There is a University and Medical School in the capital.

In *Holland, Denmark, Sweden* and *Norway* a severe State Examination must be passed at a University. Under very special circumstances exemption might perhaps be obtained—at least in Norway.

In *Italy* qualified men who confine their practice to their own countrymen are not interfered with, though, in order to practise generally, the M.D. of an Italian University must be obtained.

*Mexico.*—No examination is required. It is, however, considered that a medical degree from the University of Mexico would be very advantageous to anyone wishing to practise in Central or South America. There are four Government and five State Medical Schools.

*Nicaragua.*—No restrictions.

*Paraguay.*—An examination, said to be of a very simple character, has to be passed. The chairman of the Board of Examiners is an Englishman, Dr. HOSKINS. The British Consul, too, is an English medical man.

*Peru.*—Application should be made to the dean of the Medical Faculty, Lima, who, after verifying the diplomas obtained in Europe, will arrange for the candidate's examination. Five examinations are required and they correspond in general to those of the Paris Faculty; the pharmaceutical preparations which have to be known are those of the French Codex, and the medical jurisprudence is also French. There is a very thorough clinical examination, but plenty of time is allowed, and books, and even the patient's case-register, may be referred to, so that there is no attempt to "catch" or to unnecessarily puzzle a

candidate. The examination is of course in the Spanish language, but no very profound knowledge of it is required. A candidate must understand what is said and be able to make his meaning intelligible in that language, but the examiners will permit him to explain himself in French or English. It is not absolutely necessary to take the degree of Doctor, but it is best to do so in the case of desiring to join any of the medical societies. The fees amount to about £40. There is at present no English medical man in practice in Lima; and as there are a good many English and American residents there would seem to be an opening, though of course the country is not so wealthy as before the war.

In *Portugal* a State Examination must be passed at one of the medical schools. This requires a good knowledge of the vernacular, but it is incumbent on those who wish to practise in Portugal or Madeira.

In *Roumania* there is a *viva-voce* examination.

In *Russia* the State Examination for *Vrach* (medical practitioner) has to be passed. When the applicant holds a foreign M.D. of high value, the Minister of Education may permit the examination to be confined to reading and defending a somewhat elaborate dissertation or thesis.

*Salvador*.—No restrictions.

*Spanish Honduras*.—No restrictions.

In *Spain* recognition can usually be obtained for British diplomas, but there is frequently considerable delay. Application should be made through the British Minister.

In *Switzerland* British practitioners are now obliged to pass the State Examination, which is conducted in French or German, at one of the Swiss universities.

In *Turkey*, including Syria, there is an examination at Constantinople which may be passed in English, with a fee of £4 10s., and there is frequently a good deal of delay.

In *The Orange Free State*, although there is said to be a very conservative feeling towards foreigners, it is believed that British practitioners would, if properly accredited, obtain permission to practise.

*Uruguay*.—An examination (or rather a complete series of examinations) conducted in Spanish at the University of Monte Video, is required, and a fee of \$300 paper currency, which is double the sum required from a native.

*Venezuela*.—Nominally an examination at one of the two medical schools, Caracas and Maracaibo, is required, but practically there is nothing to hinder an English medical man from practising.

#### UNITED STATES.

*Alabama*.—An examination by the State Medical Board or one of the County Boards is required. This lasts about a week, and 75 per cent. of the marks in each subject are required to be obtained.

*Arizona*.—Diploma to be registered by County Recorder.

*Arkansas*.—Diploma to be registered by the State Board of Examiners or one of the County Boards.

*California*.—Diploma to be registered by one of the Boards of Medical Examiners. Fee \$5.

*Colorado*.—Registration of diploma by State Board of Medical Examiners.

*Connecticut*.—No requirements.

*Delaware*.—Registration of diploma by a County Clerk.

*Florida*.—Examination required before one of the eight district Boards of Medical Examiners.

*Georgia*.—Diploma to be registered in the office of the Clerk of the Superior Court.

*Idaho*.—Diploma to be recorded at the County Seat.

*Illinois*.—Diploma to be presented to the State Board of Health.

*Indiana*.—Diploma to be registered by the Clerk of the Circuit Court of the County. Fee \$1½.

*Iowa*.—Diploma to be registered by the State Board of Medical Examiners.

*Kansas*.—No requirements.

*Kentucky*.—Diploma to be registered by the State Board of Health.

*Louisiana*.—Diploma to be presented to the State Board of Health and endorsed and afterwards registered by a County Clerk or Justice of the Peace.

*Maine*.—No requirements.

*Maryland*.—Diploma to be presented to the State Board of Health, Baltimore. The fee is \$10.

*Massachusetts*.—No requirements.

*Michigan*.—Diploma to be registered in the County Clerk's Office.

*Minnesota*.—Examination required before the State Board of Medical Examiners, St. Paul. Candidates whose diplomas are more than five years old are considered "old practitioners" and are not required to obtain more than 35 per cent. of the marks in anatomy and some other subjects, but their general average must be 65 per cent. There are examinations in January, April, July and October. The fee is \$10.

*Mississippi*.—Examination required before a County Board of Medical Censors.

*Missouri*.—Diploma to be registered by the State Board of Health, City of Jefferson. Fee \$1.

*Montana*.—Diploma to be presented to the State Board of Medical Examiners.

*Nebraska*.—Diploma to be registered by the County Clerk.

*Nevada*.—Diploma to be filed by the County Recorder.

*New Hampshire*.—No requirements except of a formal character.

*New Jersey*.—Examination before the State Board of Medical Examiners, Jersey City. The Examination is in writing and occupies two days; 33½ per cent. of the marks are required in every subject, and a general average of 75 per cent. Fee \$15.

*New York*.—The only body entitled to license applicants is the University of the State of New York, Albany. An examination, lasting four days, is required. This embraces Anatomy, Physiology, Hygiene, Chemistry, Surgery, Obstetrics, Pathology, Diagnosis, Therapeutics (including Practice) and Materia Medica. Examinations are held in New York (410, East Twenty-sixth-street), Albany (High School Building), Syracuse (High School) and Buffalo (High School) five times a year. Seventy-five per cent. of correct answers are required in all subjects, and all subjects must be passed at the same examination. The fee, which must be paid in advance, is \$25.

*North Carolina*.—Examination by the State Board of Medical Examiners; 80 per cent. of the marks are required to be obtained. A temporary licence can be obtained while waiting for the examination. A fee of \$10 is required.

*North Dakota.*—Examination by the State Board of Medical Examiners, Grand Forks. Examinations held in January, April, July and October.

*Ohio.*—No requirements.

*Oregon.*—Diploma must be recorded with Secretary of the State Medical Board, Portland. Fees \$2.

*Pennsylvania.*—Diploma to be endorsed by some medical college in the State, and then registered by a county prototary. Fee \$1.

*Rhode Island.*—No requirements.

*South Carolina.*—Examination before the State Board required.

*South Dakota.*—Diploma to be recorded by the State Board of Health. Fee \$5.

*Tennessee.*—Diploma to be registered by the State Board of Medical Examiners, Trenton. Fee \$1.

*Texas.*—Diploma to be presented for endorsement to a District Board of Medical Examiners and afterwards registered.

*Utah.*—No requirements.

*Vermont.*—Diploma to be endorsed and registered.

*Virginia.*—Examination by the State Medical Examining Board.

*Washington.*—Examination by the State Medical Examining Board, Walla Walla. Fee \$10.

*West Virginia.*—Diploma to be registered by the State Board of Health.

*Wisconsin.*—No requirements, but it is advisable to join some medical society.

*Wyoming.*—Diploma to be filed with the County Registrar of Deeds.

## SESSION 1892-93.

### GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION OF THE UNITED KINGDOM.

*Registration of Medical Students.*—The following are the General Medical Council's Regulations in reference to the registration of students in medicine :—

Every medical student shall be registered in the manner prescribed by the General Medical Council. No medical student shall be registered until he has passed a preliminary examination as required by the General Medical Council, and has produced evidence that he has commenced medical study. The commencement of the course of professional study recognised by any of the qualifying bodies shall not be reckoned as dating earlier than fifteen days before the date of registration. The registration of medical students shall be placed under the charge of the branch registrars. Every person desirous of being registered as a medical student shall apply to the branch registrar of the division of the United Kingdom in which he is residing; and shall produce or forward to the branch registrar a certificate of his having passed a preliminary examination as required by the General Medical Council, and evidence that he has commenced medical study. The branch registrar shall enter the applicant's name and other particulars in the Students' Register, and shall give him a certificate of such registration. Each of the branch registrars shall supply to the several qualifying bodies, medical schools, and hospitals, in that part of the United Kingdom of which he is registrar, a sufficient number of blank forms of application for the registration of medical students. The several Branch Councils—and in England the Executive Committee, if its meeting be more convenient and the case be urgent—have power to admit special exceptions to the foregoing regulations as to registration,

for reasons which shall appear to them satisfactory. The several qualifying bodies are recommended not to admit to the final examination for a qualification under the Medical Acts any candidate (not exempted from registration) whose name has not been entered in the Medical Students' Register at least forty-five months previously. In the case of candidates from other than schools of the United Kingdom, the Branch Councils—and in England the Executive Committee, if its meeting be more convenient and the case be urgent—have power to admit exceptions to this recommendation.

The Preliminary Examination in General Education, required to be passed previously to registration as a Medical Student, shall be as follows :—

1. English language, including grammar and composition. 2. Latin, including grammar, translation from specified authors, and translation of easy passages not taken from such authors. 3. Mathematics, comprising (a) arithmetic, (b) algebra, as far as simple equations, inclusive; (c) geometry, the subject matter of Euclid, Books I., II., and III., with easy deductions. 4. One of the following optional subjects: (a) Greek, (b) French, (c) German, (d) Italian, (e) any other modern language, (f) logic."

The Council will not in future accept any certificate of pass in Preliminary Examination in General Education unless the whole of the subjects included in the Preliminary Examination required by the Council for Registration of Students of Medicine have been passed at the same time, but this rule shall not apply to those who, previously to Jan. 1st, 1892, have passed a part of any Preliminary Examination recognised by the Council; provided that a University Examination required for graduation in Arts, wherein the specified subjects of General Education are included, may be recognised for the purpose of registration.

*Professional Education.*—1. "The course of professional study after registration should occupy at least five years, conditionally."

2. "The first four of the five years should be passed at a School or Schools of Medicine recognised by any of the Licensing Bodies mentioned in Schedule A of the Medical Act (1858), provided that the first year may be passed at a University or Teaching Institution, recognised by any of the Licensing Bodies, where the subjects of Physics, Chemistry, and Biology are taught."

3. "Graduates in Arts or Science of any University recognised by the Medical Council who shall have spent a year in the study of Physics, Chemistry, and Biology, and have passed an examination in these subjects for the degrees in question, should be held to have completed the first of the five years of medical study."

4. "The fifth year should be devoted to clinical work at one or more of such public hospitals or dispensaries, British or foreign, as may be recognised by any of the medical authorities mentioned in Schedule A of the Medical Act (1858), provided that of this year six months may be passed as a pupil to a Registered Practitioner holding a public appointment, or possessing such opportunities of imparting practical knowledge as shall be satisfactory to the medical authorities."

5. "The Regulations of the Examining Bodies and of the schools should be so framed that attendance on systematic courses may be concluded at the end of the fourth year of study, so as to permit of the student devoting the fifth year to clinical work, as defined in Resolution 4."

6. "The regulations requiring attendance on systematic Courses of Lectures ought not to require attendance on more than three Lectures weekly in any one Course."

7. "Due time should be set aside for Practical Work in the various subjects. Attendance on a Practical Course should be carefully ascertained and certified. By a Practical Course is understood one in which work is done by the student himself, under the direction of a duly qualified teacher."

8. "In order to promote a practical system of Clinical Teaching, the Regulations should specify 'Hospital Practice with Clinical Instruction.' Ample time should be set aside for Hospital Work, and means should be taken to ascertain regularity of attendance in the Wards and Out-patient Departments. Every candidate for the Final Professional Examination at the end of the fifth year should be required to give evidence that he has had sufficient opportunities of practical study."

This Resolution relates to such offices as the following: Clinical Medical Clerkship and Surgical Dressership—either for in- or out-patients; Obstetrical Clerkship; post-mortem Clerkship.

9. "No qualification in Medicine ought to be granted without evidence of clinical instruction in infectious diseases."

*Professional Examination.*—10. "With the view of

securing attention to practical work in Education, the time devoted to the practical part of the examinations in all the subjects should be extended."

11. "The examination in the Elements of Physics (including Mechanics), Chemistry, and Biology should be passed before the beginning of the second winter session."

12. "Antecedent to the Final Examination there should be three Professional Examinations, arranged in such manner as to secure due continuity and sequence of study."

13. "All examinations, except the Final Examination in Medicine, Surgery, and Midwifery, should be passed before the final year intended for clinical work."

14. "The Final Examination in Medicine, Surgery, and Midwifery must not be passed before the close of the fifth year of medical study."

15. "The system of compensation as between the three different subjects of the qualifying examinations—viz., Medicine, Surgery, and Midwifery—is contrary to the intention of the Medical Act (1886), and the Council directs the attention of the several medical authorities to this fact."

16. "The marks for the written and oral examinations in Medicine and Surgery at the Final Examination should not exceed those for the clinical and practical portions of the examination."

17. "Seeing that the practice of different authorities varies on the question whether a student who fails to satisfy the Examiners in each of the several subjects of Medicine, Surgery, and Midwifery should be referred on all of them, or only on those in which he fails, the Council recommends that some general principle should be adopted with reference to this question; and suggests that a percentage of not less than 60 marks on each of any two subjects—supposing that the pass requirement be 50 per cent.—should exempt from re-examination in those two subjects."

18. "The Council recommends to the Examining Bodies the use of a percentage system of marks; and, for facilitating the work of the inspectors appointed by the Council, the adoption of a uniform pass mark of 50 per cent."

19. "With regard to the Course of Study and Examinations which persons desirous of qualifying for the medical profession shall go through in order that they may become possessed of the requisite knowledge and skill for the efficient practice of the profession, the Council now resolves that, in its opinion, the following conditions ought to be enforced without exception on all who commence their medical studies at any time after Jan. 1, 1892:—

(a) "With the exceptions provided for under Resolution 3, the period of professional study, between the date of registration as a medical student and the date of Final Examination for any diploma which entitles its bearer to be registered under the Medical Acts, must be a period of *bona fide* study during not less than five years:

(b) "In every course of professional study and examinations the following subjects must be contained: (i.) Physics, including the Elementary Mechanics of Solids and Fluids, and the rudiments of Heat, Light, and Electricity; (ii.) Chemistry, including the principles of the science and the details which bear on the study of Medicine; (iii.) Elementary Biology; (iv.) Anatomy; (v.) Physiology; (vi.) Materia Medica and Pharmacy; (vii.) Pathology; (viii.) Therapeutics; (ix.) Medicine, including Medical Anatomy and Clinical Medicine; (x.) Surgery, including Surgical Anatomy and Clinical Surgery; (xi.) Midwifery, including Diseases peculiar to Women and to new-born Children; (xii.) Theory and Practice of Vaccination; (xiii.) Forensic Medicine; (xiv.) Hygiene; (xv.) Mental Disease."

\* It is to be understood, as regards the above-mentioned subjects, that the Council offers no opinion as to the manner in which the subjects should be combined or distributed for purposes of teaching or examination.

(c) "At successive stated times during the first four years of the course of study all students must pass such intermediate examinations as will test their proficiency in the successive earlier branches of medical education, and, while tending to promote a due sequence in the medical studies, will also tend to lighten the final examination of matters which can properly be spared from it."

W. J. C. Miller, B.A., Registrar of the General Council and of the Branch Council for England, 299, Oxford-street, London, W.—James Robertson, Registrar of the Branch Council for Scotland, 1, George-square, Edinburgh.—R. L. Heard, M.D., Registrar of the Branch Council for Ireland, 35, Dawson-street, Dublin.

#### I.—UNIVERSITIES IN THE UNITED KINGDOM.

The following is a list of Examining Bodies whose examinations fulfil the conditions of the Medical Council as regards preliminary education, and have been recognised as entitling to registration as a medical or dental student; provided that the Elementary Mechanics of Solids and Fluids, comprising the elements of Statics, Dynamics, and Hydrostatics, is shown to have been included in the examination:—

*University of Oxford.*—Junior Local Examinations; Certificate to include Latin and Mathematics, and also one of these optional subjects—Greek, French, German. Senior Local Examinations; Certificate to include Latin and Mathematics. Responsions. Moderations. Examination for a degree in Arts.

*University of Cambridge.*—Junior Local Examinations; Certificate to include Latin and Mathematics, and also one of these optional subjects—Greek, French, German. Senior Local Examinations; Certificate to include Latin and Mathematics. Higher Local Examinations. Previous Examination. Examination for a degree in Arts.

*University of Durham.*—Examination for Certificate of Proficiency. Examination for students at the end of their first year. Examination for a degree in Arts.

*University of London.*—Matriculation Examination. Preliminary Scientific (M.B.) Examination. Examination for a degree in Arts or Science.

*Victoria University.*—Preliminary Examination; Latin to be one of the subjects. Entrance Examination in Arts, to include all the subjects required.

*University of Edinburgh.*—Local Examinations (Junior Certificate); Certificate to include English Literature, Arithmetic, Algebra, Geometry, Latin, and also one of these optional subjects—Greek, French, German. Local Examinations (Senior Certificate); Certificate to include English Literature, Arithmetic, Algebra, Geometry, Latin, and also one of these optional subjects—Greek, French, German. Preliminary Examination for Graduation in Science or Medicine and Surgery. Examination for a degree in Arts.

*University of Aberdeen.*—Local Examinations (Junior Certificate); Certificate to include all the subjects required. Local Examination (Senior Certificate); Certificate to include English Literature, Arithmetic, Algebra, Geometry, Latin, and also one of these optional subjects—Greek, French, German. Preliminary Examination for Graduation in Medicine or Surgery. Examination for a degree in Arts.

*University of Glasgow.*—Local Examinations (Junior Certificate); Certificate to include all the subjects required. Local Examinations (Senior Certificate); Certificate to include English Literature, Arithmetic, Algebra, Geometry, Latin, and also one of these optional subjects—Greek, French, German. Preliminary Examination for Graduation in Medicine or Surgery. Examination for a degree in Arts.

*University of St. Andrews.*—Local Examinations (Senior Certificate); Certificate to include English Literature, Arithmetic, Algebra, Geometry, Latin, and also one of these optional subjects—Greek, French, German. Local Examinations (Junior Certificate), to include all the subjects required. Preliminary Examination for Graduation in Medicine or Surgery. Examination for a degree in Arts.

*University of Dublin.*—Public Entrance Examination. General Examination at end of Senior Freshman year. Examination for a degree in Arts.

*Royal University of Ireland.*—Matriculation Examination.

*Oxford and Cambridge Schools Examination Board.*—Certificate to include the following subjects, an adequate knowledge of English Grammar and Orthography, as shown in the course of the examination, to the satisfaction of the examiners, being held as conforming to the requirements of the Medical Council in regard to those subjects: (a) Arithmetic, including Vulgar and Decimal Fractions; (b) Algebra, including Simple Equations; (c) Geometry, including the first two books of Euclid; (d) Latin, including Translation and Grammar; (e) Also one of these optional subjects—Greek, French, German.

#### II.—OTHER BODIES NAMED IN SCHEDULE (A) TO THE MEDICAL ACT.

*Apothecaries' Society of London.*—Examination in Arts.  
*Royal Colleges of Physicians and Surgeons of Edinburgh.*—Preliminary (combined) Examination in General Education.  
*Faculty of Physicians and Surgeons of Glasgow.*—Preliminary Examination in General Education.

*Royal College of Surgeons in Ireland.*—Preliminary Examination; Certificate to include Mathematics.

#### III.—EXAMINING BODIES IN THE UNITED KINGDOM, NOT INCLUDED IN SCHEDULE (A) TO THE MEDICAL ACT, 1858.

*College of Preceptors.*—(44) Examination for a First Class Certificate, or Second Class Certificate of First or Second

Division, Algebra, Geometry, Latin, and either a Modern Language, or Greek, or Logic, having been taken. (45) Preliminary Examination for Medical Students.

*Intermediate Education Board of Ireland.*—(46) Junior Grade Examination, (47) Middle Grade Examination, (48) Senior Grade Examination (Certificate in each case to include all the subjects required).

*Educational Institute of Scotland.*—(49) Preliminary Medical Examination.

*Scottish Education Department.*—(50) Leaving Certificates in each Grade and in Honours.

#### IV.—INDIAN, COLONIAL, AND FOREIGN UNIVERSITIES AND COLLEGES.

“The Certificates from Indian, Colonial, and Foreign Universities and Colleges must contain evidence that the Examination passed included all the subjects required by the General Medical Council. In the case of Natives of India or other Oriental countries, whose vernacular is other than English, an Examination in a Classic Oriental Language may be accepted instead of an Examination in Latin.”

### REGULATIONS

OF THE

## MEDICAL EXAMINING BOARDS IN THE UNITED KINGDOM.

### UNIVERSITY OF OXFORD.

There are two degrees in Medicine, B.M. and D.M., and two degrees in Surgery, B.Ch. and M.Ch.

The B.M. and B.Ch. degrees are granted to those members of the University who have passed the Second Examination. Graduates in Arts (B.A. or M.A.) are alone eligible for these two degrees. In order to obtain the degrees of B.M. and B.Ch. the following examinations must be passed:—1. Preliminary subjects: Mechanics and Physics, Chemistry, Animal Morphology and Botany. 2. Professional. (a) First Examination: Subjects—Organic Chemistry, unless the candidate has obtained a first or second class in Chemistry in the Natural Science School; Human Physiology, unless he has obtained a first or second class in Animal Physiology in the Natural Science School; Human Anatomy, and *Materia Medica* with Pharmacy. (b) Second Examination: Subjects—Medicine, Surgery, Midwifery, Pathology, Forensic Medicine with Hygiene. The approximate dates of the examinations are as follows:—Preliminaries—Mechanics, Physics and Chemistry, November and June; Animal Morphology and Botany, December and March; Professional First B.M., June and December.

*Note.*—The examination in June includes all the subjects, that in December Anatomy and Physiology only, Second B.M. about the beginning of June.

The degree of D.M. is granted to Bachelors of Medicine of the University—(1) who took the degree of B.M. previously to the end of Trinity Term, 1886, provided they have spent three years in the practice of Medicine after taking that degree, and have composed a dissertation on some medical subject approved by the Regius Professor of Medicine, before whom it must be read in public; (2) who took the degree of B.M. subsequently to the end of Trinity Term, 1886, provided they have entered their thirty-ninth term and have composed on some medical subject a dissertation which is approved by the professors in the Faculty of Medicine and examiners for the degree of B.M. whose subject is dealt with. A book published within two years of the candidate's application for the degree may be substituted for a dissertation. The degree of M.Ch. is granted to Bachelors of Surgery of the University who have entered their twenty-seventh term, who are members of the surgical staff of a recognised hospital, or have acted as Dresser or House Surgeon in such a hospital for six months, and who have passed an examination in Surgery, Surgical Anatomy, and Surgical Operations. This examination is held annually at the end of the Second B.M. Examination.

The First Examination for the degrees of B.M. and B.Ch. may be passed as soon as the Preliminary Scientific Examination has been completed. The subjects of this examination may be presented separately or in any combination or in any order, provided Anatomy and Physiology be passed together.

The Second Examination may be passed after the completion of the first.

*Scholarships &c.*—Scholarships in some branch of Natural Science (Chemistry, Physics, Biology) of the average value of £80 per annum, tenable for four years and renewable under certain conditions for a fifth year, as well as Exhibitions of a less annual value, are awarded after competitive examination every year by some, from time to time by other, Colleges. Notices of vacancy &c. are published in the *University Gazette*. In February there is competed for annually, by those who have obtained a first class in any school (Moderations or final), or a Scholarship or Prize open to general competition in the University, one Radcliffe Travelling Fellowship. It is tenable for three years, and is of the annual value of £200. The examination is partly scientific, partly medical. The holder must travel abroad for the purpose of medical study, and take the degree of B.M. Oxon. A Rolleston Memorial Prize is awarded once in two years to members of the Universities of Oxford and Cambridge of not more than ten years' standing for an original research in some Biological subject, including Physiology or Pathology.

More detailed information may be obtained from the University Calendar; the Examination Statutes, 1891, which contain the official schedules of the several subjects of examination in both Arts and Medicine; from the Student's Handbook to the University; from the Regius Professor of Medicine; from the Professors in the several departments of science.

### UNIVERSITY OF CAMBRIDGE.

The student must enter at one of the Colleges, or as a non-collegiate student, and keep nine terms by residence in the University. He must pass the Previous Examination in Classics and Mathematics, which may, and should if possible, be done immediately on coming into residence in October, or, what is better, obtain exemption through the Oxford and Cambridge Schools Examination Board or the Cambridge Local Examinations, before commencing residence. He may then devote himself to medical study in the University, attending the hospital and the medical lectures, dissecting &c. Or he may, as nearly all students now do, proceed to take a degree in Arts, either continuing mathematical and classical study and passing the ordinary examinations for B.A., or going out in one of the Honour Triposes. The Natural Sciences Tripos is the most appropriate, as some of the subjects are practically the same as those for the first and second M.B. examinations.

For the degree of *Bachelor of Medicine (M.B.)* five years of medical study are required. This time may be spent in Cambridge or at one of the recognised Schools of Medicine. The first three or four years are usually spent in Cambridge, the student remaining in the University till he has passed, say, the examination for the Natural Sciences Tripos and the first and second examinations for M.B. Cambridge being now a complete School of Medicine, all the requisite lectures and hospital practice may be attended here, and many students remain to attend lectures and hospital practice until they have passed the first part of the third examination for M.B. The supply of subjects for Dissection, Practical Surgery, &c., is unusually abundant.

There are three examinations for M.B. The *first* in Chemistry and other branches of Physics, and in Elementary Biology. These parts may be taken together or separately. The *second* in Human Anatomy and Physiology, and in Pharmaceutical Chemistry. These may be taken together or separately. The *third* may also be taken in two parts—viz., (1) Principles and Practice of Surgery (with Operative and Clinical Surgery) and Midwifery and Diseases of Women, and (2) Pathology, Principles and Practice of Medicine, Elements of Hygiene and Medical Jurisprudence. The examinations are partly in writing, partly oral, and partly practical, in the hospital, in the dissecting-room and in the laboratories.

As Operative and Clinical Surgery now form parts of the third M.B. examination candidates who have passed both parts of that examination are admitted to the degree of *Bachelor of Surgery (B.C.)* without separate examination, and without keeping an Act.

The degree of *Doctor in Medicine* may be taken three

years after that of M.B. or four years after that of M.A. An Act has to be kept, consisting of an original Thesis sustained in the Public Schools, with *viva-voce* examination; and an extempore Essay has to be written on some subject relating to Physiology, Pathology, the Practice of Medicine or State Medicine.

For the degree of *Master in Surgery (M.C.)* the candidate must have passed all the examinations for B.C. He is required to pass an examination in Surgical Anatomy and Surgical Operations, Pathology and the Principles and Practice of Surgery, and to write an extempore Essay on a Surgical Subject. Before he can be admitted to this examination two years at least must have elapsed from the time when he completed all required for the degree of B.C.

An abstract of the Regulations and Schedules of the range of the examinations in Chemistry, Physics, Biology and Pharmacy may be obtained upon sending a stamped directed envelope to the Assistant Registrar, Cambridge. Full information is contained in the *Cambridge University Calendar*.

### UNIVERSITY OF LONDON.

The *Matriculation Examinations* take place on the second Monday in January and the second Monday in June. Candidates must be above sixteen years of age. The fee for the examination is £2. Provincial examinations are appointed by the Senate from time to time at specified centres. The examination appointed for January 13th, 1890, will be held at Birmingham, Cardiff, Glasgow, Leeds and Portsmouth, as well as at London. That appointed for June, 1890, will be held also at Bangor, Birmingham, Cardiff, Edinburgh, Epsom, Leeds, Liverpool, Manchester, Newcastle-on-Tyne, Nottingham and Sheffield. Several scholarships, exhibitions and prizes are associated with these examinations.

The *Preliminary Scientific (M.B.) Examination* takes place twice in each year, once for Pass and Honours, commencing on the third Monday in July, and one for Pass candidates only on the third Monday in January.<sup>1</sup> No candidate will be admitted to this examination until he shall have passed the Matriculation Examination, nor unless he shall have given notice of his intention to the registrar at least one calendar month before the commencement of the examination. Fee for this examination, £5.

*Bachelor of Medicine.*—Every candidate for the degree of Bachelor of Medicine will be required—1. To have passed the Matriculation Examination in this University. 2. To have passed the Preliminary Scientific Examination. 3. To have been engaged in his professional studies during four years subsequently to passing the Preliminary Scientific Examination<sup>2</sup> at one or more of the medical institutions or schools recognised by this University, one year at least of the four to have been spent in one or more of the recognised institutions or schools in the United Kingdom. 4. To pass two examinations in Medicine.

*Intermediate Examination.*—The Intermediate Examination in Medicine takes place twice in each year, once for Pass and Honours, commencing on the second Monday in July, and once for Pass candidates only, commencing on the third Monday in January. No candidate shall be admitted to this examination unless he have passed the Preliminary Scientific Examination at least two years previously, and have produced certificates to the following effect:—1. Of having completed his nineteenth year. 2. Of having, subsequently to having passed the Matriculation Examination, been a student during two years at one or more of the medical institutions or schools recognised by this University, and of having attended a course of lectures on each of three of the subjects in the following list: Descriptive and Surgical Anatomy, Histology and Physiology, Pathological Anatomy, Materia Medica and Pharmacy, General Pathology, General Therapeutics, Forensic Medicine, Hygiene, Obstetric Medicine and Diseases peculiar to Women and Infants, Surgery, Medicine. 3. Of having, subsequently to having passed the Preliminary Scientific Examination,

diseased during two sessions. 4. Of having, subsequently to having passed the Preliminary Scientific Examination, attended a course of Practical Chemistry, comprehending practical exercises in conducting the more important processes of general and pharmaceutical chemistry, in applying tests for discovering the adulteration of articles of the *Materia Medica* and the presence and nature of poisons, and in the examination of mineral waters, animal secretions, urinary deposits, calculi &c. 5. Of having attended to Practical Pharmacy and of having acquired a practical knowledge of the preparation of medicines. These certificates (as is the case also with all the certificates hereinafter mentioned) must be transmitted to the Registrar, at least four weeks before the commencement of the examination. Fee for this examination, £5.

*M.B. Examination.*<sup>3</sup>—The M.B. Examination takes place twice in each year—once for Pass and Honours, commencing on the last Monday in October; and once for Pass candidates only, commencing on the first Monday in May. No candidate will be admitted to this examination within two academical years of the time of his passing the Intermediate Examination unless he be a registered medical practitioner of not less than three years' standing, in which case he must produce a certificate of having gone through the required course of training at some time previously. Every candidate must produce certificates showing that he has passed all the previous examinations and of having attended a course of lectures on each of two of the subjects enumerated in Section 2 of the regulations for that examination, and for which the candidate had not on that occasion presented certificates. 3. Of having conducted at least twenty labours. Certificates on this subject will be received from any legally qualified practitioner in Medicine. 4. Of having attended the Surgical Practice of a recognised hospital or hospitals during two years, with clinical instruction and lectures on Clinical Surgery. 5. Of having attended the Medical Practice of a recognised hospital or hospitals during two years, with clinical instruction and lectures on Clinical Medicine. 6. Of having, after having attended Surgical and Medical Hospital Practice for at least twelve months subsequently to passing the Intermediate Examination, attended to Practical Medicine, Surgery, or Obstetric Medicine, with special charge of patients, in a hospital, infirmary, dispensary, or parochial union during six months, such attendance not to be counted as part of either the Surgical or the Medical Hospital Practice prescribed in Clauses 4 and 5. 7. Of having acquired proficiency in Vaccination. Certificates on this subject will be received only from the authorised vaccinators appointed by the Privy Council. The fee for this examination is £5.

*Bachelor of Surgery.*—The examination for the degree of Bachelor of Surgery takes place once in each year, and commences on the Tuesday following the first Monday in December. Candidates must produce certificates to the following effect:—1. Of having passed the examination for the degree of Bachelor of Medicine in this University. 2. Of having attended a course of instruction in Operative Surgery and of having operated on the dead subject. Fee for this examination, £5.

*Master in Surgery.*—The examination for the degree of Master in Surgery takes place once in each year, and commences on the first Monday in December.

Candidates must produce certificates to the following effect:—1. Of having taken the degree of Bachelor of Surgery in this University.<sup>4</sup> 2. Of having attended, subsequently to having taken the degree of Bachelor of Surgery in this University: (a) to Clinical or Practical Surgery during two years in a hospital or medical institution recognised by this University; or (b) to Clinical or Practical Surgery during one year in a hospital or medical institution recognised by this University, and of having been engaged during three years in the practice of his profession; or (c) of having been engaged during five years in the practice of his profession, either before or after taking the degree of Bachelor of

<sup>1</sup> Candidates for the degree of M.B. are required by the Senate to pass the Preliminary Scientific Examination before commencing their regular medical studies, and are recommended to devote a preliminary year to preparation for it, according to the following programme:—Winter Session: Experimental Physics, Chemistry (especially Inorganic), Zoology. Summer Session: Practical Chemistry (Inorganic), Botany.

<sup>2</sup> Candidates who passed the Matriculation Examination in January 1886, or previously, will be allowed to date the commencement of their professional studies, as heretofore, from that examination.

<sup>3</sup> Any candidate for the M.B. Examination who has passed the Intermediate Examination under the former regulations will be required to have also passed the examination in Physiology at some previous Intermediate Examination carried on under the present regulations, at which examination he shall not be allowed to compete for Honours.

<sup>4</sup> Candidates who have obtained the degree of Bachelor of Medicine previously to 1866 will be admitted to the examination for the degree of Master in Surgery without having taken the degree of Bachelor of Surgery; and in the case of such candidates the attendance on surgical practice required by Regulation 2 may commence from the date of the M.B. degree.

Surgery in this University. One year of attendance on Clinical or Practical Surgery, or two years of practice, will be dispensed with in the case of those candidates who at the B.S. Examination have been placed in the first division.

3. Of moral character, signed by two persons of respectability.

Fee for this degree, £5. The examination is conducted by means of printed papers and *vis-à-vis* interrogation.

Candidates will be examined in Mental Physiology, especially in its relations to mental disorder, and in Surgery.

Any candidate for the degree of M.S. may transmit to the Registrar, not later than October 1st, a printed Dissertation, Thesis, or Commentary, written in view of candidature, or published within two academical years immediately preceding, treating scientifically some special department of Surgical Science.

*Doctor of Medicine.*—The examination for this degree takes place once in each year and commences on the first Monday in December.

Candidates must produce certificates to the following effect: 1. Of having passed the examination for the degree of Bachelor of Medicine in this University. 2. Of having attended, subsequently to having taken the degree of Bachelor of Medicine in this University, (a) to Clinical or Practical Medicine during two years in a hospital or medical institution recognised by this University, or, if he enter for State Medicine, during two years to State Medicine; or (b) to Clinical or Practical Medicine during one year in a hospital or medical institution recognised by this University, or during one year to State Medicine as above, and having been engaged during three years in the practice of his profession; or (c) of having been engaged during five years in the practice of his profession, either before or after taking the degree of Bachelor of Medicine in this University.

Fee for this degree, £5. The examination is conducted by means of printed papers and *vis-à-vis* interrogation.

#### UNIVERSITY OF DURHAM.

Three Licences and six degrees in Medicine and Hygiene are conferred—viz., Licences in Medicine, in Surgery, and in Sanitary Science; and the degrees of Bachelor in Medicine, Bachelor in Surgery, Master in Surgery, Doctor in Medicine, Bachelor in Hygiene, and Doctor in Hygiene.

For the degree of *Bachelor in Medicine (M.B.)* there are four professional examinations.

The subjects for the First Examination are—Elementary Anatomy and Elementary Biology, Chemistry and Physics.

The subjects for the Second Examination are—Anatomy, Physiology, *Materia Medica*, Therapeutics and Pharmacology.

The subjects for the Third Examination are—Medicine, Surgery, Pathology, Medical Jurisprudence, Public Health and Practical Pharmacy.

The subjects for the Fourth Examination are—Clinical Medicine, Clinical Surgery, Midwifery and Diseases of Women and Children.

N.B.—It is required that one of the five years of professional education shall be spent in attendance at the University College of Medicine, Newcastle-upon-Tyne. Candidates for the First Examination who have passed the First Examination of the Conjoint Board in England, and candidates who hold a qualification from a recognised Licensing Body in the United Kingdom, will be exempt from the First Examination of the University, except in the subjects of Chemistry with Physics and Botany. Candidates who have passed the First and Second Examinations of the University will be exempt from the First and Second Examinations of the Conjoint Board.

For the degree of *Bachelor in Surgery (B.S.)* every candidate must have passed the examination for the degree of Bachelor in Medicine of the University of Durham, and must have attended one course of lectures on Operative Surgery, and one course on Regional Anatomy. Candidates will be required to perform operations on the dead body, and to give proof of practical knowledge of the use of surgical instruments and appliances.

For the degree of *Master in Surgery (M.S.)* candidates must not be less than twenty-four years of age, and must satisfy the University as to their knowledge of Greek. In case they shall not have passed in this subject at the Preliminary Examination in Arts for the M.B. degree, they must present themselves at Durham for examination

in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.S. They must also have obtained the degree of Bachelor in Surgery of the University of Durham, and must have been engaged for at least two years, subsequently to the date of acquirement of the degree of Bachelor in Surgery, in attendance on the practice of a recognised hospital, or in the naval or military services, or in medical or surgical practice.

The subjects of examination are:—Principles and Practice of Surgery, Surgical Pathology, Surgical Anatomy, Surgical Operations, Clinical Surgery.

For the degree of *Doctor in Medicine (M.D.)* candidates must be of not less than twenty-four years of age, and must satisfy the University as to their knowledge of Greek. In case they shall not have passed in this subject at the Preliminary Examination in Arts for the M.B. degree they must present themselves at Durham for examination in it at one of the ordinary examinations held for this purpose before they can proceed to the higher degree of M.D. They must also have obtained the degree of Bachelor in Medicine of the University of Durham, and must have been engaged for at least two years, subsequently to the date of acquirement of the degree of Bachelor in Medicine, in attendance on the practice of a recognised hospital, or in the military or naval services, or in medical and surgical practice.

Each candidate must write an Essay, based on original research or observation, on some medical subject selected by himself, and approved of by the Professor of Medicine, and must pass an examination thereon, and must be prepared to answer questions on the other subjects of his curriculum so far as they are related to the subject of the Essay.

Candidates for any of the above degrees must give at least twenty-eight days notice to the Registrar of the College.

#### VICTORIA UNIVERSITY.

Colleges of the University: Owens College, Manchester; University College, Liverpool; and Yorkshire College, Leeds.

Four degrees in Medicine and Surgery are conferred by the Victoria University—viz., Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

All candidates for degrees in Medicine and Surgery are required—(1) to have matriculated in the University; and (2) to pass (either *before* or *after* matriculation) an examination called the Entrance Examination in Arts, or to have passed such other examination as may be recognised by the University for this purpose.<sup>5</sup>

*Degree of Bachelor of Medicine.*—Before admission to the degree of M.B. candidates are required to present certificates that they will have attained the age of twenty-one years on the day of graduation, and that they have pursued the courses of study required by the University Regulations during a period of not less than five years subsequently to the date of their registration by the General Medical Council, two of such years having been passed in a college of the University, and one year at least having been passed in a college of the University subsequently to the date of passing the First M.B. Examination. All candidates for the degrees of Bachelor of Medicine and Bachelor of Surgery are required, after matriculating, to satisfy the examiners in the several subjects of the following examinations: the First Examination, the Second Examination, and the Final Examination.

*The First Examination.*—The subjects of examination are as follows:—(1) Chemistry; (2) Elementary Biology; (3) Physics. Candidates must have attended during at least one year courses both of lectures and of laboratory work in each of the above-named subjects.

*The Second Examination.*—The subjects of examination are as follows:—(1) Anatomy; (2) Physiology, including

<sup>5</sup> The examinations at present recognised are:—1. The Preliminary Examination of the Victoria University, provided Latin and Mechanics have been taken up. 2. The Matriculation Examination of the University of London. 3. The Previous Examination of the University of Cambridge. 4. Responsions and Moderations of the University of Oxford. 5. The Leaving Certificate Examination of the Oxford and Cambridge Boards, provided that it include Latin, English, Mathematics, and Elementary Mechanics. 6. The Final Examination for Graduation in Arts of any University in Great Britain and Ireland.

Physiological Chemistry and Histology; (3) *Materia Medica* and Pharmacy.

*The Final Examination.*—The subjects of examination are as follows:—(1) Pharmacology and Therapeutics. (2) General Pathology and Morbid Anatomy. (3) Forensic Medicine and Toxicology, and Public Health. (4) Obstetrics and Diseases of Women. (5) Surgery, Systematic, Clinical and Practical. (6) Medicine, Systematic and Clinical, including Mental Diseases and Diseases of Children.

Candidates may either present themselves in all the six subjects of examination on the same occasion, or may pass the examination in two parts, the first part consisting of *two or three* of the subjects (1), (2) and (3), the second part of the remaining subjects.

Candidates who fail to satisfy the examiners in a first part must either present themselves again in the subjects as selected or in all the six subjects of examination.

Candidates for a final part of the examinations must have completed the *fourth winter* of medical study, in accordance with the regulations of the University.

Candidates for a second part of the examination, or for the whole examination, must have completed the *fifth* year of medical study, in accordance with the regulations of the University.

*Degree of Doctor of Medicine.*—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degree of Bachelor of Medicine, and at least one year has elapsed since they passed the examination for that degree. Candidates for the degree of Doctor of Medicine are required to present a printed Dissertation embodying the results of personal observations or original research, either in some department of medicine or of some science directly relative to medicine. No candidate will be admitted to the degree unless his Dissertation, after report from the Departmental Board of Medical Studies, shall have been recommended by the General Board of Studies to the Council for acceptance in that behalf. Candidates may be examined on any subject connected with their dissertations.

*Degree of Master of Surgery.*—Candidates are not eligible for the degree of Master of Surgery unless they have previously received the degree of Bachelor of Surgery, and at least one year has elapsed since they passed the examination for that degree. The subjects of examination are as follows: (1) Surgical Anatomy; (2) Surgical Pathology; (3) Practical Surgery, including the performance of operations on the dead body; (4) Clinical Surgery; (5) Ophthalmology.

#### UNIVERSITY OF EDINBURGH.

Three medical degrees are conferred by the University of Edinburgh—namely, Bachelor of Medicine (M.B.), Master in Surgery (C.M.), and Doctor of Medicine (M.D.). The degree of Master in Surgery is not conferred on any person who does not also at the same time obtain the degree of Bachelor of Medicine.

No one is admitted to the degrees of Bachelor of Medicine and Master in Surgery who has not been engaged in Medical and Surgical study for four years.<sup>6</sup>

Every candidate for the degrees of M.B. and C.M. must give sufficient evidence by certificates—(a) That he has studied each of the following departments of medical science—namely, Anatomy, Chemistry, *Materia Medica*, Institutes of Medicine or Physiology, Practice of Medicine, Surgery, Midwifery and the Diseases peculiar to Women and Children, and General Pathology, each during courses including not less than one hundred lectures; Practical Anatomy, a course of the same duration as those of not less than one hundred lectures;<sup>7</sup> Practical Chemistry, three months; Practical Midwifery—(1) that he has attended at least twelve cases of labour under the superintendence of a registered medical practitioner, or (2) that he has attended six such cases, and also has attended, for at least three months, the practice of a midwifery hospital in which prac-

<sup>6</sup> No course of lectures will be allowed to qualify unless the lecturer certifies that it has embraced at least one hundred lectures, or fifty lectures, in conformity with the requirements of this section. Three months' courses on *Materia Medica*, Pathology, and Midwifery do not qualify.

<sup>7</sup> Certificates of attendance on Practical Anatomy must express not only the number of months engaged in dissection, but the names of the parts dissected, and the degree of care with which the dissections have been made. Students are recommended not to appear for an examination in Anatomy with a view to a degree until they have dissected the human body at least once.

tical instruction is regularly given; Clinical Medicine and Clinical Surgery;<sup>8</sup> courses of the same duration as those of not less than one hundred lectures, or two courses of three months' lectures, being given at least twice a week; Medical Jurisprudence, Botany, and Natural History (including Zoology), during courses including not less than fifty lectures. (b) That he has attended, for at least two years, the medical and surgical practice of a general hospital which accommodates not fewer than eighty patients, and possesses a distinct staff of physicians and surgeons. (c) That he has attended, during a course of not less than fifty hours' instruction, the class of Practical *Materia Medica* and Pharmacy in the University of Edinburgh, or a similar class conducted in a university or recognised school of medicine, or a similar class conducted at the laboratory of a hospital or dispensary, or elsewhere, by a teacher recognised by the University Court; or that he has been engaged by apprenticeship for not less than two years with a registered medical practitioner, or a member of the Pharmaceutical Society of Great Britain, or a member of the Pharmaceutical Society of Ireland, or a pharmaceutical chemist, or chemist and druggist, registered under the provisions of the Act for Regulating the Qualifications of Pharmaceutical Chemists, 1852, the Pharmacy Act, 1868, or the Pharmacy Act (Ireland), 1875, in the *bona-fide* compounding and dispensing of drugs, and the preparation of their official and other preparations under his superintendence. (d) That he has attended, for at least six months, by apprenticeship or otherwise, the outdoor practice of a hospital, or the practice of a dispensary physician, a surgeon or a member of the London or Dublin Society of Apothecaries. (e) That he has attended, during courses of not less than fifty hours' instruction, classes of Practical Physiology and Practical Pathology in the University of Edinburgh, or in a recognised university or school of medicine, or upon classes thereof, conducted by a teacher recognised by the University Court.

Students of Medicine in the London Schools, and in the school of the College of Surgeons in Dublin, can obtain there two *anni medicæ* out of the four required for the Edinburgh degrees in Medicine. Courses of lectures in these schools and the courses of the medical teachers and of the science teachers in King's College and in University College, London, in the subjects of graduation, are regarded as equivalent to lectures on the corresponding subjects in this University, except *Materia Medica* and Midwifery, which, when only three months' courses, are not received as equivalent. One *annus medicus* may be constituted by attendance on Practical Anatomy and Hospital Practice during the winter session. Another *annus medicus* by attending either (a) full winter courses on any two of the following subjects—Anatomy, Physiology, Chemistry, Pathology, Surgery, Medicine, Clinical Surgery, Clinical Medicine; or (b) on one such course and two three months' courses on any of the following subjects—Botany, Practical Chemistry, Natural History, Medical Jurisprudence. If the student selects the arrangement prescribed in a, attendance on a third course, although unnecessary to constitute an *annus*, will also be accepted. The other subjects and the additional courses, not given in London or Dublin, necessary for the degrees of the University, require to be attended at this University. In provincial schools where there are no lecturers recognised by the University Court a candidate can only have one *annus medicus*, and this is constituted by attendance at a qualified hospital along with a course of Practical Anatomy. But in a provincial school where there are two or more lecturers recognised by this University a second *annus medicus* may be made by attendance on at least two six months' or one six months' and two three months' recognised courses.

Every candidate must deliver, before the 31st day of March of the year in which he proposes to graduate, to the Dean of the Faculty of Medicine, a declaration in his own handwriting that he has completed his twenty-first year.

Each candidate is examined, both in writing and orally, on Chemistry, Botany and Natural History (Physics is now required by the regulation of the General Medical Council), on Anatomy, Institutes of Medicine, *Materia Medica* (including Practical Pharmacy and Prescribing) and Pathology; on Surgery, Practice of Medicine, Midwifery and Medical Jurisprudence; clinically, on Medicine and on Surgery in a hospital. The examinations on Anatomy, Chemistry, Institutes of Medicine, Botany, Natural His-

<sup>8</sup> The Medical Faculty recommend that medical students should not attend Clinical Surgery during their first six months' attendance on Clinical Medicine.

tory, *Materia Medica* and *Pathology* are conducted, as far as possible, by demonstrations of objects placed before the candidates. Students who profess themselves ready to submit to an examination in the first division of these subjects may be admitted to examination therein at the first period of examination after they have completed their attendance on the necessary classes, provided always that it shall be lawful for students to proceed to examination in the said subjects under one or more of the following subdivisions—namely: (a) Botany and Natural History, (b) Chemistry (including Practical Chemistry), (c) Botany and Chemistry (including Practical Chemistry), or (d) Natural History and Chemistry (including Practical Chemistry), at the first period of examination after they have completed attendance on the relative classes; and to proceed to examination in the remaining subject or subjects at a subsequent period of examination. Students who have passed their examination on the first division of these subjects may be admitted to examination on the second division at the end of their third year. The examination on the third and fourth divisions cannot take place until the candidate has completed his fourth *annus medicus*. Candidates may, if they choose, be admitted to examination on the first two of these divisions at the end of their third year, or to the four examinations at the end of their fourth year.

The degree of Doctor of Medicine may be conferred on any candidate who has obtained the M.B. and C.M. of the University, and who is of the age of twenty-four years, and produces a certificate of having been engaged, subsequently to his having received the degrees of M.B. and C.M., for at least two years in attendance on a hospital, or in a military or naval medical service, or in medical and surgical practice. Provided always that the degree of M.D. shall not be conferred on any person unless he be a graduate in Arts of one of the Universities of England, Scotland or Ireland, or of such other universities as are above specified, or unless he shall before or at the time of his obtaining the degrees of M.B. and C.M., or thereafter, have passed a satisfactory examination on three of the subjects mentioned in Section II. of the statutes relative to preliminary examination. Two of these must be Greek and Logic or Moral Philosophy, and the third is to be one of the following subjects, at the option of the candidate—namely, French, German, Higher Mathematics and Natural Philosophy. And provided also that the candidate for the degree of M.D. shall submit to the Medical Faculty a thesis, certified by him to have been composed by himself, and which shall be approved by the Faculty, on any branch of knowledge comprised in the Professional Examinations for the degrees of M.B. and C.M. which he may have made a subject of study after having received these degrees.

The fees for M.B. and C.M. are £22. Total fees and stamp for graduating as M.D. only, by regulations for students commencing before February, 1861, £25. The fees for examination must be paid at the secretary's office ten days before the date thereof, and the fees for the degree of M.D. and the stamp duty for the latter must be paid on or before the 15th day of July in the year of graduation. In the event of the candidate not passing any one of the Professional Examinations, the fee is not returned; but he may appear at one subsequent examination without paying an extra fee, and at any future examination on paying one-half the fee.

#### UNIVERSITY OF GLASGOW

The fees for the degrees are £23 2s. for M.B. and Ch.B., which are obtained together, £10 10s. (exclusive of stamp duty) for M.D., and £10 10s. for Ch.M.

A syllabus containing further particulars may be obtained by application to the assistant clerk, Matriculation Office, the University.

The First, Second, and Third Professional Examinations are held in March and in October each year, and the Fourth or Final Examination is held annually in June and July.

The candidate for the degrees of Bachelor of Medicine and Bachelor of Surgery must have been registered in the books of the General Medical Council at least five years prior to the date of his graduation. Students should see to registration without delay, as considerable trouble and disappointment have sometimes arisen through ignorance or neglect of this requirement.

A degree in Arts or in Science (not being an honorary degree) in any of the Universities of the United Kingdom, or in any Colonial or Foreign University specially recognised for the purpose by the University Court, shall exempt from the preliminary examination, and the Joint Board of Examiners appointed under the provisions of Ordinance, General No. 8, by the Scottish Universities' Commissioners, have power to determine what examinations, other than those for the degrees before mentioned, shall be accepted in place of the Preliminary Examination.

This registration in the books of the Medical Council, which is imperative on candidates for any legal qualification to practise whatsoever, is quite distinct from matriculation or other registration of students in the books of the University.

#### PROFESSIONAL EDUCATION.

*Duration and Constitution of the Curriculum.*—Candidates shall be admitted to the degree of Bachelor of Medicine and Bachelor of Surgery only after they have been engaged in medical study for five years,—the medical session of each year, or *annus medicus*, being constituted by at least two courses of not less than one hundred lectures each, or by one such course and two courses of not less than fifty lectures each; but in the case of the Clinical Courses it shall be sufficient that the lectures be given at least twice a week during the prescribed periods.

Two of the five years of medical study must be in the University of Glasgow. During each of the first four years the candidate must have attended at least two courses of instruction in the prescribed subjects, each course extending over a session of not less than five months; or alternatively, one such course along with two courses, each extending over a session of not less than two months and a half. During the fifth year the candidate must be engaged in clinical study for at least nine months at a public hospital or dispensary. The remaining three years may be spent in any University of the United Kingdom, or in any recognised Indian, colonial, or foreign University, or in recognised medical schools or under recognised teachers.

All candidates availing themselves of the permission to attend the lectures of extra-academical teachers in Glasgow and not being at the time matriculated students of the University, must at the commencement of the year of such attendance, enrol their names in a book kept by the University for that purpose, paying a fee of the same amount as the matriculation fee paid by students of the University; and having, in respect of such payment, a right to the use of the University Library.

The fee for attendance on the lectures of any extra-academical teacher in Glasgow, with a view to graduation, shall be not less than the amount exigible for the corresponding courses in the University.

No attendance on lectures shall be reckoned if the teacher gives instruction in more than one of the prescribed branches of study, except in those cases where professors of the University are at liberty to teach more than one branch.

The terms for conferring Medical and Surgical degrees in Session 1892-3 are Nov. 10th, 1892; Feb. 9th, 1893; April 21st, 1893; and July 27th, 1893.

*M.D. Examination.*—The conditions for this degree are in great part similar to those which obtain in the University of Glasgow. Each candidate will be required to pass an examination in Clinical Medicine at any period subsequently to one year after obtaining his M.B. and C.M. degrees. He will also be required to write a Thesis. If the candidate is going abroad he may take the Clinical Examination at any time after passing the M.B. and C.M. examination. But the degree of Doctor of Medicine shall not be conferred on him unless he shall produce a certificate that, subsequently to having received the M.B. and C.M. degrees, he has been engaged for at least one year in attendance in the medical wards of a hospital or in scientific work bearing directly on his profession, such as is conducted in the research laboratories of the University or in the naval or military medical services, or for at least two years in practice which has not been exclusively surgical, and unless his Thesis in the judgment of the Faculty of Medicine is of exceptional merit.

*Fees.*—The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery shall be twenty-two guineas, and the proportion of this sum to be paid by a candidate at each division of the examination shall be regulated from time to time by the University Court. The fee to be paid for the degree of Doctor of Medicine shall be ten guineas, exclusive of any stamp duty which for the time

may be exigible. The fee to be paid for the degree of Master of Surgery shall be ten guineas.

*Out-door Visitation.*—Under the superintendence of a consulting staff of physicians and surgeons connected with the University, students in the last year of their course are permitted to visit and prescribe for the sick poor in the Anderston district. For this no fee is charged, and medicines are dispensed gratis. Upwards of 3000 visits are made annually.

#### UNIVERSITY OF ABERDEEN.

The curricula for the several degrees conferred are nearly the same as in the University of Edinburgh.

Professional Examinations will be held twice in each year—namely, in March and July, directly after the close of the winter and summer sessions.

The fees for graduation are the same as in the University of Edinburgh. Matriculation fee, including all dues, for the winter and summer sessions, £1; summer session alone, 10s.

Candidates who commenced their medical studies before November, 1861, are entitled to appear for examination for the degree of M.D. after four years' study, one of which must have been in the University of Aberdeen.

Besides the Royal Infirmary, students have the opportunity of attending the following institutions: General Fever Hospital; Sick Children's Hospital; General Dispensary, and Lying-in and Vaccine Institutions daily; Royal Lunatic Asylum; Eye Institution, in which is given clinical instruction on Diseases of the Eye, and on the application of the Ophthalmoscopes for their diagnosis.

A diploma in Public Health is granted by the University to graduates in Medicine of a University in the United Kingdom only, after a special examination. The diploma can be entered on the Register of the General Medical Council.

Application for further information should be addressed to the Dean of the Medical Faculty.

The degrees of B.Sc. and D.Sc. are granted, after examination, in one of several specified departments of Science, to be selected by the candidate. For regulations apply to the Secretary of Science Department.

#### UNIVERSITY OF ST. ANDREWS.

Two degrees in Medicine are granted—namely, Bachelor of Medicine and Master in Surgery (M.B., C.M.), and Doctor of Medicine (M.D.). The curricula for these degrees, and the regulations under which they are conferred, differ from those of the University of Edinburgh only in the particulars noticed below.

The degree of *Doctor of Medicine* may be conferred by the University of St. Andrews on any registered medical practitioner above the age of forty years whose professional position and experience are such as, in the estimation of the University, to entitle him to that degree, and who shall, on examination, satisfy the medical examiners of the sufficiency of his professional knowledge; provided always that degrees will not be conferred under this section on a greater number than ten in any one year. The examinations are held yearly about the middle of April. Candidates must lodge with the Dean of the Medical Faculty the following certificates, along with application for admission to examination:—1. A certificate of age, being a baptismal certificate or an affidavit. 2. Holograph certificates from at least three medical men of acknowledged reputation in the medical profession or in the medical schools, recommending the candidate to the Senatus for the degree, and testifying to his professional skill and position. 3. A portion of the graduation fee (viz., £10 10s.), which shall be forfeited should the candidate fail to appear to graduate at the time appointed. A satisfactory examination, written and *visà voce*, must be passed in the following departments—viz., *Materia Medica* and *General Therapeutics*, *Medical Jurisprudence*, *Practice of Medicine* and *Pathology*, *Surgery*, *Midwifery* and *Diseases of Women and Children*.

No one will be received as a candidate for the degree of *Bachelor of Medicine* and *Master in Surgery* unless two years at least of his four years of medical and surgical study shall have been in one or more of the following universities or colleges—viz., the Universities of St. Andrews, Glasgow, Aberdeen, Edinburgh, Oxford and Cambridge; Trinity

College, Dublin; Queen's College, Belfast; Queen's College, Cork; and Queen's College, Galway.

Subject always to the condition here specified, the studies for candidates for the degrees of Bachelor of Medicine and Mastery in Surgery will be under the following regulations: The remaining years of medical and surgical study may be either in one or more of the universities and colleges above specified, or in the hospital schools of London, or in the school of the College of Surgeons of Dublin, or under such private teachers of medicine as may from time to time receive recognition from the University Court. Attendance during at least six winter months on the Medical or Surgical practice of a general hospital which accommodates at least eighty patients, and during the same period on a course of Practical Anatomy, may be reckoned as one of such remaining years.

Every candidate for examination for the degree of M.B. and C.M. is required to lodge a declaration of age, a statement of his course of study, his inaugural dissertation and all his certificates with the Dean of the Medical Faculty, on or before the 25th of March in each year.

#### UNIVERSITY OF DUBLIN (TRINITY COLLEGE).

*Matriculation.*—All students in the School of Physic intending to practise Physic must be matriculated, for which a fee of 5s. is payable. No student can be admitted for the winter course after Nov. 25th.

*Previous Medical Examination.*—Candidates for degrees in Medicine, Surgery and Midwifery are required to pass an examination in Physics, Chemistry, Botany, Comparative Anatomy, Descriptive Anatomy and Institutes of Medicine (Practical Histology and Physiology) previously to their degree examination.

*Bachelor in Medicina.*—A candidate for this degree must be a graduate in Arts, and may obtain the degree of Bachelor in Medicine at the same Commencements as that at which he receives his degree of B.A., or at any subsequent Commencements. The medical education of a Bachelor in Medicine is of five years' duration, and comprises attendance on a single course of each of the following lectures:—Anatomy, Practical Anatomy, Chemistry, *Materia Medica* and Pharmacy, Physiology (two courses), Practice of Medicine, Botany, Medical Jurisprudence and Hygiene, Pathology, Heat, Electricity, Magnetism, Light and Sound, Zoology, three courses of nine months' attendance on the Clinical Lectures of Sir Patrick Dun's or other metropolitan hospital recognised by the Board of Trinity College. Six months' Dissections, three months' Laboratory Instruction in Chemistry, three months' Practical Histology, three months' study of Mental Diseases, and one month's instruction in Vaccination are required. Any of the above-named courses may be attended at any medical school in Dublin recognised by the Provost and Senior Fellows. Fee for the *Licent ad Examinandum*, £5; for the M.B. degree, £11.

*Doctor in Medicina.*—A Doctor in Medicine must be M.B. of at least three years' standing, or have been qualified to take the degree of M.B. for three years, and must read a thesis or undergo an examination before the Regius Professor of Physic, in accordance with the rules and statutes of the University. Total amount of fees for this degree, £13.

*Bachelor in Surgery.*—A Bachelor in Surgery must be a Bachelor in Arts, and have spent five years in the study of Surgery and Anatomy. He must also pass a public examination in the Hall before the Professors of the School of Physic, having previously completed the prescribed curriculum of study, which includes the following additions to the courses named above for the M.B.:—Theory of Surgery, Operative Surgery, Two Courses of Dissections, Ophthalmic Surgery.<sup>9</sup> Candidates are required to perform surgical operations on the dead subject. Fee for the *Licent ad Examinandum*, £5; for the degree of Bachelor in Surgery, £5.

*Master in Surgery.*—A Master in Surgery must be a Bachelor in Surgery of the University of Dublin, or not less than three years' standing, and must produce satisfactory evidence of having been engaged for not less than two years from the date of his registration in the study,

<sup>9</sup> Students in the School of Physic who matriculated before June 22nd, 1872, may obtain the degree of Master in Surgery according to the regulations in force previously to the creation of the degree of Bachelor in Surgery.

or study and practice, of his profession. He must then pass an examination in the following subjects:—1. Clinical Surgery. 2. Operative Surgery. 3. Surgical Pathology. 4. Surgery. 5. Surgical Anatomy (on the dead subject) and one of the following optional subjects:—1. Surgery in one of its recognised branches—viz., Ophthalmic and Aural, Gynaecological, and Dental. 2. Mental Disease. 3. Medical Jurisprudence and Hygiene. 4. Advanced Anatomy and Physiology. 5. Comparative Anatomy. Fee for the degree of Master in Surgery, £11.

*Bachelor in Obstetric Science.*—The candidate for the B.A.O. Examination must be a Bachelor in Arts, having previously completed the prescribed curriculum of study. The curriculum comprises the following, in addition to the complete course for the M.B.:—Theory and Practice of Midwifery, one course (winter); Practical Midwifery, including Clinical Lectures, six months. The candidate is then required to pass an Examination in Practical Midwifery, Gynaecology and Obstetrical Anatomy. Fee for the degree of Bachelor in Obstetric Science, £1. There is no *Liccat* fee.

*Master in Obstetric Science.*—A Master in Obstetric Science must have passed the M.B. and B.Ch. examinations, and produce a certificate of having attended a summer course in Obstetric Medicine and Surgery.<sup>10</sup> He is then required to pass an examination in the following subjects:—1. Practice of Midwifery. 2. Gynaecology. 3. Anatomy of Female Pelvis and Elementary Embryology. 4. Clinical Gynaecology. Fee for the degree of Master in Obstetric Science, £5.

*University Diplomas.*—Candidates for the diplomas in Medicine, Surgery or Obstetric Science must be matriculated in Medicine, and must have completed two years in Arts and four years in Medical Studies.

*Diploma in Medicine.*—The Medical Course and Examination necessary for the diploma in Medicine are the same as for the degree of M.B., except that the candidate is not required to attend the Lectures on Botany and Comparative Anatomy, nor to pass the previous medical examination in those subjects. A diplomate in Medicine, on completing his course in Arts and proceeding to the degree of B.A., may become a Bachelor in Medicine by attending the Lectures on Botany and Comparative Anatomy, passing the previous medical examination in those subjects, and paying the degree fees. Fee for the *Liccat ad Examinandum*, £5. Fee for the diploma in Medicine, £5.

*Diploma in Surgery.*—The Surgical Course and Examination necessary for the diploma in Surgery are the same as for the degree of Bachelor in Surgery. Fee for the *Liccat ad Examinandum*, £5. Fee for the diploma in Surgery, £5.

*Diploma in Obstetric Medicine.*—The Course and Examination for the diploma in Obstetric Science are the same as that for the Bachelor in Obstetric Science. Fee for the diploma in Obstetric Science, £1.

N.B.—Each candidate having completed the prescribed courses of study, passed the requisite qualifying examinations in Medicine, Surgery and Midwifery, and having conferred on him the corresponding degrees, will obtain from the Senior Proctor a diploma entitling him to be entered on the Register of Medical Practitioners under the Medical Act, 1886.

## ROYAL UNIVERSITY OF IRELAND.

All Degrees, Honours, Exhibitions, Prizes and Scholarships in this University are open to students of either sex.

Candidates for any degree in this University must have passed the Matriculation Examination. Students from other universities and colleges are included in this rule.

The following degrees &c. are conferred by the University in this Faculty:—Bachelor of Medicine, Doctor of Medicine, Bachelor of Surgery, Master of Surgery, Bachelor of Obstetrics, Master of Obstetrics; in Sanitary Science, a special diploma; in Mental Disease, a special diploma.

The Medical Examinations, except that for the diploma in Sanitary Science, will be held twice yearly—viz., in April and in October. The examination for the diploma in Sanitary Science will be held in July.

The course for degrees in Medicine &c. is of at least five years' duration.

*The First Examination in Medicine.*—Students may not

be admitted to this examination until the lapse of two academical years from the time of their matriculation. They must also have previously passed the First University Examination. The subjects of this examination are Natural Philosophy, Theoretic Chemistry, Zoology and Botany. The examination in each subject will comprise two parts:—1. A written examination. 2. Practical work and oral examination. For Chemistry the practical examination takes place at the close of the second year. Particular weight will be given to the practical part of the examination. Candidates at the First Examination in Medicine who at the First University Examination in Arts did not obtain 30 per cent. of the marks assigned to French or German will be required to present themselves for a qualifying examination in French or German. Failure to obtain 30 per cent. of the marks assigned to either of those languages will involve the loss of the examination.

*The Second Examination in Medicine.*—Students will be admitted to this examination after the lapse of one academical year from the time of passing the First Examination in Medicine, provided they have completed the first period of the course of medical studies. The subjects for this examination are Anatomy, Physiology and Practical Chemistry.

*The Third Examination in Medicine.*—Students will be admitted to this examination after the lapse of one academical year from the time of passing the Second Examination in Medicine, provided they have completed the third year of medical studies. The subjects for this examination will be Anatomy, Physiology, and *Materia Medica* (Pharmacology).

*The Examination for the Medical Degrees.*—Students will be admitted to this examination after the lapse of one academical year from the time of passing the Third Examination in Medicine, provided they have completed the course of medical studies prescribed for the fourth year. The examination consists of three parts or divisions:—(a) Medicine, including Therapeutics and Pathology, Mental Diseases, Medical Jurisprudence and Hygiene. (b) Surgery, Theoretical, Clinical, Operative; Surgical Anatomy, with Ophthalmology and Otolaryngology. (c) Midwifery and Gynaecology with Diseases of Children. Each part of this examination must be passed as a whole. Upon completing satisfactorily his examination in all three divisions the candidate will, in addition to the parchment diplomas recording his admission to the Medical Degrees of M.B., B.Ch. and B.A.O., receive a certificate of having passed a qualifying examination in the subjects of Medicine, Surgery and Midwifery. The fee for this certificate is £10, which must be paid prior to the candidate's admission to the Medical Degrees.

*M.D. Degree.*—Candidates may be admitted to this degree after the lapse of three academical years from the time of obtaining the degree of M.B. Every candidate will be examined at the bedside, and required to diagnose at least three medical cases, and prescribe treatment, and to write detailed reports on at least two cases to be selected by the examiners and to discuss all the questions arising thereon.

*The M.Ch. Degree.*—This degree will be conferred only on graduates in Medicine of the University of at least three years' standing. The examination for this degree will comprise Surgical Diseases and Surgery, both theoretical and operative; Surgical Anatomy; Ophthalmology and Otolaryngology, and will include—(a) a written examination; (b) a clinical examination; (c) an examination on Surgical Instruments and Appliances; (d) an examination in Operative Surgery.

*The Mastership in Obstetrics.*—This degree will be conferred only on graduates in Medicine of the University of at least three years' standing. The examination will comprise the Theory and Practice of Midwifery and of Diseases of Women and Children and the Use of Instruments and Appliances, and will include—(a) a written examination; (b) a clinical examination as far as practicable; (c) an oral examination, with practical illustrations; (d) an examination on Instruments and Appliances.

## ROYAL COLLEGE OF SURGEONS OF ENGLAND.

The diploma of Member of this College is not now granted apart from the licence of the Royal College of Physicians except to students who commenced their professional studies prior to Oct. 1st, 1884.

<sup>10</sup> Existing graduates in Medicine of the standing of M.D. are not required to attend this course.

## ROYAL COLLEGE OF PHYSICIANS OF LONDON.

The licence of this College is no longer granted by itself, except to students who commenced professional study prior to the 1st October, 1884, and consequently it is no longer necessary to publish the Regulations.

## EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

*Regulations relating to the several Examinations applicable to Candidates who commenced their Professional Education on or after the 1st of October, 1884.*

Any candidate who desires to obtain both the licence of the Royal College of Physicians of London and the diploma of Member of the Royal College of Surgeons of England is required to comply with the following regulations, and to pass the examinations hereinafter set forth.

*Professional Examinations.*—There are three Professional Examinations, called herein the First Examination, the Second Examination, and the Third or Final Examination, each being partly written, partly oral, and partly practical. These examinations will be held in the months of January, April, July, and October, unless otherwise appointed. Every candidate intending to present himself for examination is required to give notice in writing to Mr. F. G. Hallatt, Secretary of the Examining Board, Examination Hall, Victoria Embankment, W.C., fourteen clear days before the day on which the examination commences, transmitting at the same time the required certificates.

The subjects of the First Examination are—Chemistry, Chemical Physics, Materia Medica, Pharmacy, Elementary Anatomy, and Elementary Physiology. A candidate may take this examination in three parts at different times, or he may present himself for the whole at one time. A candidate will be admitted to the examination on Chemistry and Chemical Physics, Materia Medica, and Pharmacy, on producing evidence of having been registered as a medical student by the General Medical Council, and of having received instruction in Chemistry, Materia Medica, and Pharmacy; or he may take Materia Medica and Pharmacy as part of the Second Examination; but he will not be admitted to the examination on Elementary Anatomy and Elementary Physiology earlier than the end of his first winter session at a medical school, or than the completion of his first six months' attendance at a recognised medical school during the ordinary sessions—i.e., exclusive of the months of April, August, and September. A candidate rejected in one part or more of the First Examination will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection, and he will be re-examined in the subject or subjects in which he has been rejected. Any candidate who shall produce satisfactory evidence of having passed an examination for a degree in Medicine on any of the subjects of the first and second parts of this examination conducted at a University in the United Kingdom, in India, or in a British Colony, will be exempt from examination in those subjects in which he has passed.

The fees for admission to the First Examination are as follows: for the whole examination, £10 10s.; for re-examination after rejection in either of the parts, £3 3s.

The subjects of the Second Examination are Anatomy and Physiology. A candidate is required to present himself for examination in Anatomy and Physiology together until he has reached the required standard to pass in one or other of these subjects; but no candidate will be allowed to pass in one of the subjects without obtaining at the same time at least half the number of marks required to pass in the other subject. A candidate will be admitted to the Second Examination after the lapse of not less than six months from the date of his passing the First Examination, on producing evidence of having completed, subsequently to registration as a medical student, eighteen months of professional study at a recognised medical school or schools, and of having complied with the regulations prescribed in Section I., Clauses 4 and 5. A candidate rejected in either part or in both parts of the Second Examination will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection, and will be re-examined in the subject or subjects in which he has been rejected.

The fees for admission to the Second Examination are as follows: for the whole examination, £10 10s.; for re-examination after rejection in either of the two parts, £3 3s.

The subjects of the Final Examination are: Medicine, including Therapeutics, Medical Anatomy, and Pathology; Surgery, including Surgical Anatomy and Pathology; Midwifery and Diseases peculiar to Women. A candidate may present himself for examination in these three subjects or parts separately or at one time. A candidate will be admitted to the Third or Final Examination on producing evidence—(1) of being twenty-one years of age; (2) of having passed the Second Examination; and (3) of having studied Medicine, Surgery, and Midwifery, in accordance with the regulations prescribed in Section I., Clauses 2 and 6 to 11. The Colleges do not admit to either part of the Third or Final Examination any candidate (not exempted from registration) whose name has not been entered in the Medical Students' Register at least forty-five months, nor till the expiration of two years after his having passed the Second Examination. A candidate rejected in the Third or Final Examination, or in one or more of the three parts into which he may have divided it, will not be admitted to re-examination until after the lapse of a period of not less than six months from the date of rejection, and he will be re-examined in the subject or subjects in which he previously failed to pass. Any candidate who shall have obtained a Colonial, Indian, or Foreign qualification which entitles him to practise Medicine or Surgery in the country where such qualification has been conferred, after a course of study and examination equivalent to those required by the Regulations of the two Colleges, shall, on production of satisfactory evidence as to age and proficiency in Vaccination, be admissible to the Second and Third Examinations.

The fees for admission to the Third or Final Examination are as follows: for the whole examination, £15 15s.; for re-examination after rejection in Medicine, £5 5s.; for re-examination after rejection in Surgery, £5 5s.; for re-examination after rejection in Midwifery, £3 3s.

## ROYAL COLLEGES OF PHYSICIANS AND SURGEONS OF EDINBURGH, AND FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

These Colleges have made arrangements by which, after one series of examinations, held in Edinburgh or in Glasgow, or in Edinburgh and Glasgow, the student may obtain the diplomas of the three Bodies.

The three Bodies grant their Single Licences only to candidates who already possess another and opposite qualification in Medicine or Surgery, as the case may be. Copies of the Regulations for the Single Licence of any of the Bodies may be had on application to the respective Secretaries.

*Professional Education.*—1. Candidates who commence medical study before Jan. 1st, 1892, must have been engaged in professional study during forty-five months from the date of registration as medical students by the General Medical Council, which period shall include not less than four winter sessions' attendance at a recognised medical school. 2. The candidate must produce certificates or other satisfactory evidence of having attended the following separate and distinct courses of instruction: Anatomy, one course, during at least six months; Practical Anatomy, twelve months; Chemistry, one course, six months; Practical or Analytical Chemistry, one course, three months; Materia Medica, one course, three months; Physiology, one course, six months; Practice of Medicine, one course, six months; Clinical Medicine, nine months; Principles and Practice of Surgery, one course, six months; Clinical Surgery, nine months; Midwifery and the Diseases of Women and Children, one course, three months; Medical Jurisprudence, one course, three months; Pathological Anatomy, one course, three months. The six months' courses delivered in Scotland must consist of not fewer than 100 lectures. The three months' courses must consist of not fewer than fifty lectures. The number of lectures certified as attended at any school not situated in Scotland should not be less than three-fourths of the total number of lectures delivered in a course. 3. The candidate must also produce the following certificates:—(a) Of having attended not less than six cases of labour, three of these to be conducted personally under the direct superintendence

of the practitioner who signs the certificate, who must be a registered medical practitioner. (b) Of having attended, for three months, instruction in Practical Pharmacy; the certificate to be signed by the teacher, who must be a member of the Pharmaceutical Society of Great Britain, or the superintendent of the laboratory of a public hospital or dispensary, or a registered practitioner who dispenses medicines to his patients, or a teacher of a class of Practical Pharmacy. (c) Of having attended for twenty-four months the Medical and Surgical practice of a public general hospital containing on an average at least eighty patients available for Clinical instruction and possessing distinct staffs of physicians and surgeons. (d) Of having attended for six months (or three months, with three months' hospital clerkship) the practice of a public dispensary specially recognised by any of the above authorities; or the out-patient practice of a recognised general hospital, or of having acted for six months as pupil to a registered practitioner who either holds such a public appointment, or has such opportunities of imparting practical knowledge as shall be satisfactory to the cooperating authorities; this attendance should be made after the student has passed the First and Second Examinations. (e) Of having been instructed by a registered medical practitioner in the Theory and Practice of Vaccination, and of having performed operations under the teacher's inspection, during a period of not less than six weeks.

Candidates will be subjected to three Professional Examinations, herein called the First Examination, the Second Examination and the Final Examination, to be conducted at separate times, partly in writing and partly practically and orally.

*First Examination.*—The First Examination shall embrace the two divisions of (1) Chemistry,<sup>11</sup> (2) Elementary Anatomy,<sup>12</sup> and Histology,<sup>13</sup> and shall take place not sooner than the end of the first year, including the period of a winter and a summer session. For the whole examination taken at one time the sum of £5 5s. must be paid to the inspector of certificates not later than 4 P.M. on the Friday preceding it, after which no candidate will be entered. After rejection for re-entry in all subjects, £3 3s.; for re-entry after obtaining an absolute pass in one or two subjects, £2 2s.; for entering for one division of subjects separately, £3 3s.; and for each re-entry after rejection, £2 2s. Any candidate who shall produce satisfactory evidence of having passed an equivalent examination in any of the subjects of the first examination before any of the boards specified in the Regulations will be exempt from examination in such subjects.

*Second Examination.*—The Second Examination shall embrace the three subjects of (1) Anatomy, (2) Physiology, (3) Materia Medica and Pharmacy, each of which shall constitute a division of the examination, and may be entered for separately, and shall not take place before the termination of the summer session of the second year of study, including two winters and two summers. The fees for admission to this examination, payable not later than one week before the day of examination, are as follows:—For the whole examination, £5 5s.; after rejection for re-entry in all subjects, £3 3s.; for re-entry after obtaining an absolute pass in one or two subjects, £2 2s.; for entering for one subject separately, £2 2s.; and for each re-entry after rejection, £2 2s. Any candidate who shall produce satisfactory evidence of having passed an equivalent examination in any of the subjects of the Second Examination before any of the boards specified in the Regulations will be exempt from examination in such subject or subjects.

*Final Examination.*—The Final Examination shall embrace the three divisions of—(1) the Principles and Practice of Medicine (including Therapeutics, Medical Anatomy, and Pathology) and Clinical Medicine; (2) the Principles,

and Practice of Surgery (including Surgical Anatomy and Surgical Pathology) and Clinical Surgery; (3) Midwifery and Gynæcology, Medical Jurisprudence, and Hygiene (and which may be entered for separately at different times); and shall not take place before the termination of the full period of study. The fees for this examination, payable not later than one week before the examination day, are as follows:—For the whole Examination, taken at one time, in the case of candidates who have passed the First and Second Examinations, £15 15s., £10 10s. of which shall be returned to unsuccessful candidates. For entering for each of the three divisions of subjects separately, £6 6s., and on re-entry after rejection, £2 2s. in respect of each division or part thereof. This rule will also apply to any subsequent rejection. Any candidate admitted to the Final Examination, on the footing of having passed in the subjects of the First and Second Examinations at a recognised board, shall, on entering, pay the full fee of £26 5s.

All candidates shall be subjected, in addition to the Written and Oral Examinations, to Practical Clinical Examinations in Medicine and Surgery, which shall include the Examination of Patients, Physical Diagnosis, the Use of the Microscope, Pathology of the Urine, Surgical Appliances, Bandages, Surface Markings &c.

#### REGULATIONS FOR CANDIDATES COMMENCING STUDY AFTER JANUARY 1ST, 1892.

The courses last for five years; the fifth year should be devoted to clinical work at one or more public hospitals or dispensaries. Six months of the fifth year may be passed by the student as a pupil to a registered practitioner possessing such opportunities of imparting practical knowledge as may be deemed satisfactory by the Committee of Management. The student's regularity of attendance in the wards and out-patient departments of the hospitals and at the post-mortem examinations should be duly ascertained and noted on the certificate.

Candidates shall be subjected to four Professional Examinations: the First Examination, the Second Examination, the Third Examination and the Final Examination, to be conducted at separate times, partly in writing and partly practically and orally. The necessary schedule and certificates must be lodged, and the fees for these respective Examinations paid, at the period of entering for the earliest of them. In the event of failure the fee paid for any subsequent Examination from which a candidate had been precluded will be returned to the candidate. Candidates may enter for all the subjects of an Examination at one period, or may enter for and pass in any division of subjects thereof. A candidate may be exempted from Examination in any subject of the First, Second, or Third Examinations, on the production of a certificate proving that he has passed an equivalent Examination before any of the recognised Boards, such certificate specifying the subjects of Examination. A candidate admitted to any Examination on the footing of having passed in the subjects of the preceding Examination or Examinations at another Board shall pay the fees exigible for such preceding Examination or Examinations, in addition to the fee of the Examination for which he enters.

*First Examination.*—The First Examination shall embrace the following divisions of subjects—(1) Physics, (2) Chemistry, (3) Elementary Biology. The fees payable for admission to the First Examination shall be—for the whole Examination, £6.

*Second Examination.*—The Second Examination shall embrace the following subjects:—Elementary Anatomy and Physiology, including Histology; and candidates may be admitted to this Examination at the end of the second year. The fees payable for admission to the Second Examination shall be—for the whole Examination, £6.

*Third Examination.*—The Third Examination shall embrace the following divisions of subjects:—(1) Advanced Anatomy, (2) Pathology, (3) Materia Medica and Pharmacy. The fees payable for admission to the Third Examination shall be—for the whole Examination, £6.

*Final Examination.*—The Final Examination shall not be passed earlier than the end of the fifth year of study, and shall embrace the following divisions of subjects:—(1) Medicine, including Therapeutics, Medical Anatomy, and Clinical Surgery; (2) Surgery, including Surgical Anatomy, Clinical Surgery, and Diseases and injuries of the Eye; (3) Midwifery and Diseases of Women and of New-born Children; and

<sup>11</sup> The examination in Chemistry shall embrace the following particulars: Chemical Physics (meaning thereby Heat, Light, and Electricity); the principal Non-Metallic and Metallic Elements, and their more common combinations; and also the leading Alcohols, Organic Acids, Ethers, Carbo-hydrates and Alkaloids. The candidate will also be examined practically in Testing.

<sup>12</sup> Elementary Anatomy shall embrace: Anatomy of the Bones and Joints of the whole body and of the Muscles, chief Bloodvessels, and Nerves of the Upper and Lower Extremities.

<sup>13</sup> Histology will be held to include a knowledge and recognition of the morphological elements and structure of Skin, Bone, Cartilage, Fibrous Tissue, Hair, Nails, Teeth, Blood, Muscle, Nervous Tissue and the appearance and distribution of all the different forms of Epithelium, along with a general knowledge of the properties of cells. The Examination on this subject will be practical and oral.

(4) Medical Jurisprudence and Hygiene. All candidates shall be subjected, in addition to the Written and Oral Examinations, to Practical Clinical Examinations in Medicine and Surgery, which shall include the Examination of Patients, Physical Diagnosis, the use of the Microscope, Pathology of the Urine, Surgical Appliances, Bandages, Surface markings, &c. The fees payable to the Final Examination shall be,—for the whole Examination, £12, for re-entry in all subjects after rejection, £6: On entering for each division of subjects separately, £4, on re-entry in each division after rejection, £2.

There are six periods of Examination annually, four in Edinburgh and two in Glasgow, and candidates may present themselves at either examining centre irrespective of the place of the previous examination. The Registrar in Edinburgh is Mr. J. Robertson, 1, George-square; and the Registrar in Glasgow, Mr. A. Duncan, 242, St. Vincent-street, to whom fees and certificates must be sent.

#### ROYAL COLLEGE OF PHYSICIANS AND ROYAL COLLEGE OF SURGEONS IN IRELAND.

Two sets of regulations are at present in force, under which examinations take place for the conjoint diploma of these bodies. The older regulations, under which students who commenced their studies before Oct. 1st, 1891, may be examined, have appeared in our Students' Number in previous years, and will be found on pp. 477 and 478 of our second volume of 1888. The following regulations are obligatory on all students commencing on or after the date already mentioned:—

##### PRELIMINARY EXAMINATION AND REGISTRATION.

Every candidate for the Conjoint Examinations of the Colleges shall produce evidence—(a) of having, before entering on medical studies, passed a Preliminary Examination in general education recognised by the General Medical Council; and (b) of having been registered by that Council as a Student in Medicine. Each candidate before receiving his diplomas must produce a registrar's certificate or other satisfactory evidence that he has attained the age of twenty-one years.

*Preliminary Examination.*—The subjects for examination are identical with those prescribed for the Preliminary Examination by the General Council of Medical Education and Registration, except that it includes the additional subject of Physics, which may be passed at the Preliminary Examination or at a subsequent Supplemental Examination, at an extra fee of £1 ls. In no case can Physics be deferred to the First Professional Examination.

##### PROFESSIONAL EXAMINATIONS.

Every candidate is required to pass four Professional Examinations, one at the end of each year of his professional studies. No candidate shall be admitted to the Final or Qualifying Examination within three months of his rejection at the Final or Qualifying Examination by any other licensing body. All examinations shall be conducted as far as possible by demonstration of objects placed before the candidates.

*First Professional Examination.*—Every candidate is required, before admission to the First Professional Examination, to produce evidence—(1) of having passed in the subjects of the Preliminary Examination, including Physics; (2) of having been registered as a medical student by the General Medical Council; and (3) of having attended in winter a course of (a) lectures on Practical Anatomy, (b) Demonstrations and Dissections, and (c) lectures on Theoretical Chemistry, (d) Practical Chemistry, three months' summer course, (e) Practical Pharmacy—(1) evidence of attendance for three months in the Compounding Department of a Clinical Hospital, which hospital shall have satisfied the Committee of Management that its means of instruction are sufficient, and shall return to the Committee the names of its students at the commencement of the course, together with a record of their attendance at its close; or (2) evidence of attendance on a course of Practical Pharmacy in a recognised Medical School, the course to consist of not less than twenty demonstrations; or (3) evidence of having served a full apprenticeship of three years, or of having acted as paid assistant for not less than one year in the establishment of a Licentiate Apothecary or of a registered Pharmaceutical

Chemist.<sup>14</sup> The fee for this examination is £15 15s. The subjects of the First Professional Examination are the following:—1. Chemistry: Elementary Chemistry—Inorganic and Organic, as found in Roscoe's Lessons on Elementary Chemistry—with a practical examination in the Laboratory. 2. Anatomy: Bones, with attachments of Muscles and Ligaments—Joints. 3. Pharmacy: Practical Pharmacy, Dispensing of Drugs, Methods of Administration of Medicines, Reading of Prescriptions.

*Second Professional Examination.*—Every candidate is required, before admission to the Second Professional Examination, to produce evidence of having passed the First Professional Examination; also certificates of having, in his second or a later year of professional study, attended—(1) A Medico-Chirurgical Hospital for nine months, together with evidence of having taken notes to the satisfaction of the physicians or surgeons in charge of the cases, and certified under their hands, of at least three Medical cases and three Surgical cases in the wards of a recognised Medico-Chirurgical Hospital. (2) Courses of Lectures as follow:—Winter courses: Practical Anatomy; Demonstrations and Dissections. Summer Courses (three months): Histology; Materia Medica. The fee for this examination is £10 10s. The subjects of the Second Professional Examination are the following—1. Anatomy: The Anatomy of the whole Human Body. 2. Histology 3. Hospital Practice: Methods of Physical Diagnosis; Application of Urinary Tests; General Principles of the Treatment of Fractures, of Dislocations of Wounds and of Hæmorrhages; Bandaging; General Principles of Case-taking. 4. Physiology: Circulation; Respiration; Digestion. 5. Materia Medica. Candidates are examined on three separate days.

*Third Professional Examination.*—Every candidate is required, before admission to the Third Professional Examination, to produce evidence of having passed the Second Professional Examination; also certificates of having in his third, or a later, year of professional study attended—(1) A Medico-Chirurgical Hospital for nine months, or acted for six months as resident pupil, together with evidence of having taken notes to the satisfaction of the physicians and surgeons in charge of the cases, and certified under their hands, of at least three Medical cases and three Surgical cases in the wards of a recognised Medico-Chirurgical Hospital. (2) Courses of Lectures as follow:—Winter courses: Demonstrations and Dissections; Medicine; Surgery; Physiology. Summer course (three months): Medical Jurisprudence. The fee for this examination is £9 9s. The subjects for the Third Professional Examination are the following:—1. Anatomy: Surgical Anatomy. 2. Surgery: Surgery as in the Second Professional Examination; also Inflammation, with its varieties and consequences; Fractures; Dislocations; Injuries, mechanical, chemical, physical—their immediate and remote effects; Hernia; Surgical Diseases of Bloodvessels; Diseases of Bones; Diseases of Joints; Pyæmia; Septicæmia. 3. Medicine: Medicine as in the Second Professional Examination; also Diseases of the Heart and Circulatory System, of the Respiratory Apparatus, of the Abdominal Cavity, of the Skin; the Exanthema; and the Continued Fevers. 4. Physiology.

*Fourth or Final Professional Examination.*—Every candidate is required before admission to the Final Examination to produce evidence—(1) of having passed the Third Professional Examination; (2) of having in his fourth or a later year of professional study (a) attended a Medico-Chirurgical Hospital for nine months as extern pupil, or acted for six months as resident pupil, unless a certificate to that effect has been accepted in the third year; (b)<sup>15</sup> a winter course of lectures on Midwifery; Certificates will also be required—(1) Of having attended a recognised midwifery hospital or maternity for six months in the winter or summer of the fourth year, with evidence of having been present at thirty labours. (2) Of having for not less than three months, in either the third or fourth year, studied fever in a recognised clinical hospital containing fever wards, and recorded from daily personal observation at least five cases of fever to the satisfaction of the attending clinical physician, as attested by his signature. For the purposes of this regulation the word "fever" is held to

<sup>14</sup> Licentiate Apothecaries and Licentiates of the Pharmaceutical Societies of Great Britain and Ireland are exempt from attendance on Practical Pharmacy.

<sup>15</sup> On and after July 1st, 1891, a certificate of having attended a course of lectures on Pathology will be required in addition to the above-named lectures.

include the following diseases only—viz., typhus, typhoid or enteric fever, scarlet fever, small-pox and measles. (3) Of having attended a course of Operative Surgery in the summer session of either the third or the fourth year. (4) Of having attended, at a recognised ophthalmic and aural hospital or at a recognised ophthalmic and aural department of a general hospital, clinical lectures on Ophthalmic and Aural Surgery during a period of three months. The fee for this examination is £6 6s. The subjects for the Fourth or Final Examination are the following—1. Medicine. 2. Surgery. 3. Therapeutics. 4. Pathology. 5. Midwifery and Diseases peculiar to Women. 6. Forensic Medicine in references to Medicine, Surgery and Midwifery; Hygiene. 7. Ophthalmic and Aural Surgery.<sup>16</sup> Candidates may present themselves for examination in all the subjects of the Final Examination at the same term; or, at one term, in Medicine, including Therapeutics and Pathology and Clinical Medicine; at a second term, in Surgery, including Therapeutics and Pathology, Ophthalmic and Aural Surgery, Clinical Surgery and Operations; at a third term, Midwifery, Gynecology, Forensic Medicine and Hygiene. Candidates must pay the full fee before being admitted to any part of the examination. Candidates may take the groups in any order they please. No candidate will receive any diploma till the entire examination is completed.

#### SOCIETY OF APOTHECARIES OF LONDON.

Every student purposing to study Medicine must previously pass a Preliminary Examination in Arts qualifying for registration as medical student.

The examination to be passed for the Diploma in Medicine, Surgery and Midwifery, which is registrable under the provisions of the Medical Act, 1886, are Primary and Final, all being written, oral and practical. The Primary Examinations are held quarterly on the first Wednesday and on the Monday and Thursday of the same week in the months of January, April, July and October. The Final Examinations are held monthly, and consist of—(1) the examination in Surgery on the second Wednesday and following days; (2) the examination in Medicine and in Midwifery on the third Wednesday and on the Monday and Thursday of the same week. The course of medical study must extend over four years, and not less than three winter and two summer sessions must be passed at a recognised hospital and school of medicine. Candidates intending to present themselves for examination must give fourteen days' notice. A form for the purpose will be sent on application. The fee must be forwarded at the same time, with all required certificates, to the secretary. The entire fee for the examinations is £10 10s., which in the event of failure is not returned. A fee of £3 3s. is required for every re-examination.

The course of study required to qualify for the Primary Examinations is as follows:—Lectures on Chemistry and Chemical Physics, not less than six months; Practical Chemistry, three months; Materia Medica, three months; Pharmacy and Dispensing, three months, instruction in which must be given by a registered medical practitioner; by a member of the Pharmaceutical Society; or in a public hospital, infirmary, or dispensary. Evidence of having received instruction in these subjects before registration as medical students will be received. The first of the Primary Examinations may be passed at any period after registration. The second includes Anatomy, Physiology, and Histology; to qualify for this examination the candidate must have received instruction in Anatomy, not less than six months; Practical Anatomy with Demonstrations, twelve months; Physiology, six months; Histology with Demonstrations, three months. Candidates will be excused any or all of the subjects of the Primary on producing evidence that they have passed equivalent examinations before an examining body recognised by the Medical Council. Both examinations of the Primary may be passed the same evening.

To qualify for the Final Examinations the following course of study must be observed: Hospital Practice, Surgical and Medical, with Post-mortem Examinations, not less than

three winter and two summer sessions. No hospital is recognised for this purpose which is not in connexion with an established medical school. Lectures on the Principles and Practice of Surgery, six months; Practical Surgery, three months; Clinical Surgical Lectures, nine months; Surgical Dresser, three months; Lectures on the Principles and Practice of Medicine, six months; Pathology, three months; Clinical Medical Lectures, nine months; Medical Clinical Clerk, three months; Forensic Medicine, Hygiene, and Insanity, three months; Lectures on Obstetric Medicine, including Gynecology, three months; Clinical Instruction in the same, three months; a Course of Practical Midwifery; attendance on Twenty Midwifery Cases. The offices of Dresser and Clinical Clerk may be discharged at a hospital, infirmary, or dispensary where sufficient opportunities are afforded for the acquirement of practical knowledge.

The following regulations will apply to students who were registered on or subsequent to January 1st, 1892:—

The examinations are: primary, held quarterly; intermediate, held monthly; and final, held monthly.

The Primary Examination consists of two parts.

Part I. includes Elementary Biology. Chemistry; the Principles of the Science which bear on the study of Medicine. Chemical Physics, including the Elementary Mechanics of solids and fluids; Heat, Light, and Electricity. Practical Chemistry. Materia Medica, including the Botany of the Pharmacopœia. Pharmacy and Prescriptions. Part II. includes Anatomy, Physiology and Histology. The Intermediate Examination also consists of two parts, the first of which includes the Principles and Practice of Surgery, Surgical Pathology and Surgical Anatomy. The second part includes (a) the Principles and Practice of Medicine, including Therapeutics and Pharmacology. Pathology and Morbid Histology; (b) Forensic Medicine, Hygiene, Theory and Practice of Vaccination, and Mental Diseases. The Final Examination consists of three parts. Part I. includes an Examination of Surgical Cases, Operative Manipulation and Surgical Anatomy, and Instruments and Appliances. Part II. includes an Examination of Medical Cases and Medical Anatomy. Part III. includes: Midwifery, Gynecology and Diseases of New-born Children, and Obstetric Instruments and Appliances. This examination cannot be passed before the end of the fifth year.

The examination for a Certificate to act as an Assistant in Compounding and Dispensing Medicines is held on the fourth Wednesday of every month, and will be as follows: In Translating and Dispensing Prescriptions; in the British Pharmacopœia; in Materia Medica and Botany; in Pharmacy and Pharmaceutical Chemistry. A week's notice must be given, with the fee of 2 guineas.

*Prizes.*—A Gold Medal and a Silver Medal are given annually by the Society for proficiency in Materia Medica and Pharmaceutical Chemistry.

A Gold and a Silver Medal are also given for proficiency in Botany. The examination will take place in the month of June. Female candidates can compete.

Due notice of these examinations will be given in the medical journals.

Tickets of admission to the Lectures on Botany, given by J. G. Baker, Esq., F.R.S., F.L.S., of Kew, at the Society's Garden at Chelsea, during the months of May, June, and July, can be had on application.

Attendance is given daily at the Hall of the Society, Blackfriars, E.C., from 10 to 4 o'clock, Saturdays excepted.

#### ROYAL COLLEGE OF SURGEONS IN IRELAND AND THE APOTHECARIES' HALL OF IRELAND.

Every candidate for the Conjoint Diplomas is required to pass a Preliminary Examination and four Professional Examinations.

*First Professional Examination.*—Candidates will be required, before admission to the First Professional Examination, to produce evidence—1. Of having been registered by the Medical Council as medical students at least nine months before examination. 2. Of having attended (a) Practical Anatomy, (b) Chemistry, (c) Demonstrations and Dissections, (d) Practical Chemistry, (e) Physics, (f) Practical Pharmacy, for three months in the Compounding Department of a Clinical Hospital, or a School of Pharmacy, or in the Compounding Establishment of a Licentiate Apothecary.

<sup>16</sup> Students who commenced study before July, 1879, are exempt from both the certificate for study and the special Ophthalmic Examination, but are liable to be examined by the surgical examiners in Ophthalmic Surgery. Those who commenced before February, 1882, are exempt from the special examination, on producing the certificate of three months' clinical ophthalmology required before that date. Those who commenced after February, 1882, must pass the special examination.

The fee for this examination is £12 12s. Candidates will be examined on Physics, Chemistry, and Anatomy (Osteology).

*Second Professional Examination.*—Candidates must produce evidence of having passed the First Professional Examination; also certificates of having subsequently attended—(a) a Medico-Chirurgical Hospital for nine months, and of having taken notes of at least three Medical cases and three Surgical cases, or a certificate of Clinical Clerkship; (b) the following courses of Lectures: (1) Demonstrations and Dissections; (2) Physiology; (3) Surgery, winter courses, six months; (4) Materia Medica; (5) Practical Physiology, including Histology, summer courses, three months. The fee for this examination is £7 7s. Candidates will be examined in Anatomy, Physiology, Materia Medica, and Pharmacy.

*Third Professional Examination.*—Candidates must produce evidence of having passed the Second Professional Examination; also certificates of having subsequently attended—(a) a Medico-Chirurgical Hospital for six months as resident pupil, or for nine months as extern pupil, and, in the latter case, notes of at least three Medical and three Surgical cases, or of having acted as Clinical Clerk at any period; (b) the following courses of Lectures: (1) Demonstrations and Dissections; (2) Medicine; (3) Midwifery and Diseases peculiar to Women, in winter courses (may be deferred to the fourth year); (4) Pathology; (5) Medical Jurisprudence, Forensic Medicine, and Hygiene, in summer course. The fee for this examination is £7 7s. Candidates will be examined in Anatomy, Surgery, Medicine, and Medical and Surgical Pathology.

*Fourth Professional Examination.*—The candidate must produce evidence—(1) Of having been registered as a medical student by the Medical Council at least forty-five months previously; (2) of having passed the Third Professional Examination; (3) of having subsequently attended—(a) a Medico-Chirurgical Hospital for nine months as extern pupil, or six months as resident pupil; (b) Lectures

<sup>17</sup> The certificate in Pathology will not be required until further notice.

on Midwifery, a winter course (unless taken in the third year); (c) a recognised Midwifery Hospital, or Maternity, for six months in the winter or summer of either the third or the fourth year, with evidence of having been present at thirty labours; (d) of three months' study of Fever in a Clinical Hospital containing fever wards, and of having taken notes of at least five cases of fever (attendance at a fever hospital will not be recognised if concurrent with that on Practical Midwifery); (e) Operative Surgery in the summer session of either the third or fourth year; (f) Clinical Lectures in Ophthalmic and Aural Surgery (three months) at a recognised Ophthalmic Hospital, or at an Ophthalmic Department of a General Hospital. The fee for this examination is £7 7s. Candidates will be examined in Medicine, Therapeutics, Surgery, Midwifery and Diseases peculiar to Women, Ophthalmic and Aural Surgery, and Forensic Medicine and Hygiene.

UNIVERSITY OF BRUSSELS.

British and other practitioners holding proper medical and surgical qualifications are admissible for the Doctorate of the University of Brussels, without any further curriculum. It is necessary, however, that all candidates should leave their diplomas with the Registrar of the University prior to the examination, and no one will be admitted until this condition has been complied with. The fees are—For inscription of name, £8 12s.; for examination, £13; for legalisation of diploma, 8s.—£22. The unsuccessful candidates may present themselves again three months after rejection, on paying one-half of the examination fees. Candidates who have paid in advance the fees for the three tests, and are unsuccessful in the first, recover the fees paid for the second and third examinations; those who fail in the second recover the fees paid for the third examination. The examination consists of three tests, viz—1st Doctorate: Medicine; Special and General Pathology and Pathological Anatomy with the Microscope; General Therapeutics; Mental Diseases; Diseases of Women and Children. 2nd Doctorate: Surgery; Surgical Pathology; Ophthalmology; Midwifery; Hygiene; Medical Jurisprudence (not including

Toxicology). 3rd Doctorate: Clinical Examination in Medicine at the Hospital; Clinical Surgical Examination; Examination in Midwifery, consisting in obstetrical operations on the mannikin (model of pelvis); Examination in Operative Surgery, consisting in some of the usual operations on the dead subject, such as Amputation, Ligature of an Artery, &c.; Regional Anatomy on the Dead Body, with Dissections. Great importance is attached to practical knowledge, but candidates must also prove that they possess positive theoretical science. The examinations which are *vivâ voce* take place on the first Tuesday in November, December, February, May and June. The three examinations may be got through in about a week. Saturday, before 2 P.M., is the most eligible day for arriving, for candidates for whom time is an object. The examinations are conducted in English. There are in England at present about 600 graduates holding this degree.

### THE ARMY, NAVY, AND INDIAN MEDICAL SERVICES.

Consequent upon the issue of the Royal Warrant of August, 1891, alterations have taken place in the designations of the departmental rank of the officers of the Army Medical Staff, and medical officers are also now placed, as regards sick leave of absence on full pay, on the same conditions as those laid down for regimental officers. By a subsequent Royal Warrant, dated Nov. 10th, 1891, Art. 1208<sup>b</sup> of the Pay Warrant was revised by inserting the words "an officer of our Medical Staff" after the words "combatant officer," thus giving medical officers an equal title with combatant officers to reckon time on half-pay towards retirement, when the half-pay has been due to ill-health contracted in the performance of military duty. The substantive ranks of officers of the Medical Staff carry precedence and other advantages attaching to the rank indicated by the military portion of it, with such exceptions and within such limits as are laid down in the earlier Warrant.

In the *Gazette* of Aug. 28th, 1891, it was announced that the Queen had been pleased, by Royal Warrant, dated Aug. 7th, 1891, to approve of the following alterations of the designations of the departmental rank of the officers of the Medical Staff now serving as follows:—Surgeons-General, ranking as Majors-General, to be Surgeons-Major-General; Deputy Surgeons-General, ranking as Colonels, to be Surgeons-Colonel; Brigade-Surgeons, ranking as Lieutenant-Colonels, to be Surgeons-Lieutenant-Colonel; Surgeons-Major, ranking as Lieutenant-Colonels, to be Surgeons-Lieutenant-Colonel; Surgeons-Major, ranking as Majors, to be Surgeons-Major; Surgeons, ranking as Captains, to be Surgeons-Captain. The rank of the Director-General of the Army Medical Department is that of Surgeon-Major-General.

[For the text of the Warrant of Aug. 7th for the Medical Staff, *vide* THE LANCET of August 22nd, 1891, page 459 *et seq.*]

Admission into the Army and Indian Medical Services is gained as the result of competitive examination. Under special conditions, the admission may take place by nomination of the Secretary of State for War. Candidates for both services must, before being admitted to examination, possess the double qualification to practise Medicine and Surgery, and be registered under the Medical Act. They are also now required to produce certificates of having acted as a medical clinical clerk for six months, as surgical dresser for another six months, and of having had not less than three months' instruction at an ophthalmic hospital, including a course on errors of refraction. They must also furnish satisfactory certificates of moral character. Candidates for the Army must be between the ages of twenty-one and twenty-eight, in good health, and both parents of unmixed European blood; for the Indian Service, between twenty-two and twenty-eight, of sound bodily health, and natural-born subjects of Her Majesty. Both are examined as to physical fitness by a Board of Medical Officers. These conditions being satisfied, the candidate is admitted to the competitive examination, which is usually held in London twice a year, in the months of February and August. No candidate for the Army Medical Staff will be allowed to compete on more than two occasions. The subjects of examination are divided into *compulsory* and *voluntary*. The former comprise Anatomy

and Physiology, Surgery, Medicine, including Therapeutics and the Diseases of Women and Children, Chemistry and Pharmacy, and a practical knowledge of Drugs. The eligibility of the candidate for admission into the service is determined by the result of this part of the examination. The *voluntary* subjects are French, German, Comparative Anatomy, Zoology, Natural Philosophy, Physical Geography, and Botany, with especial reference to *Materia Medica*, and for the Indian service *Hindustani*. Although the results of the examination on voluntary subjects do not affect the question of the eligibility of the candidate for a commission, they influence his position on the lists, which is determined by the numbers obtained under the two heads conjointly. After having passed this examination, the successful candidates for both services are sent to the Army Medical School at Netley as "surgeons on probation, receiving a daily pay of 8s. and certain allowances, to go through a four months' course of instruction in the special duties required of them in the service. The staff of the school consists of four professors, all of them men of high standing in their special departments. The Professorship of Military Medicine is held by Deputy Surgeon-General Henry Cayley, I.M.S. Surgeon-Lieutenant-Colonel W. F. Stevenson, M.S., is Professor of Military Surgery; Surgeon-Lieutenant-Colonel J. L. Notter, M.D., of Military Hygiene; and Dr. A. E. Wright, of Pathology. To each of these an Army Medical Officer is attached as Assistant Professor. The lectures on Military Surgery include gunshot and other wounds, transport of sick and wounded, duties of army medical officers in the field, on board troopships and transports, recruiting, and other surgical duties incident to military service. Those on Military Medicine treat of tropical and other diseases to which soldiers are exposed in the course of their service, the mortality and invaliding by disease, in peace and war, at home and abroad, management of lunatics under the conditions of military service, &c. The course of Hygiene comprises the examination of water and air, the general principles of diet, with the quality and adulterations of food and beverages, the sanitary requirements of barracks, hospitals, and camps, the clothing, duties, and exercises of the soldier, and the circumstances affecting his health, with the best means of preventing disease, and instruction in the mode of preparing the various statistical and other returns required of the medical officer. The surgeons on probation are detailed for duty in the wards of the hospital, under the Professors and Assistant Professors of Medicine and Surgery. Here they are taught practically the details of the management of patients in a military hospital, the registration of their diseases, the duties of invaliding, the modes of filling up the regulation statistical returns and other service documents. The surgeons on probation are provided with quarters, and are members of the mess at Netley. After having passed through the course of instruction they are examined on the subjects taught in the school, and their position on the list recommended for commissions is determined by the combined results of the competitive and final examinations. At the close of each session five prizes are awarded: the Herbert Prize of £20 to the surgeon on probation who has obtained the highest number of marks at the London and Netley examinations conjointly; the Parkes Memorial Bronze Medal to the one who gains the highest number of marks in the examination on Hygiene at Netley, combined with those given for the answers to a special question set on the same subject; the Martin Memorial Gold Medal to the highest number of marks in the final examination on Military Medicine, with the addition of those gained for a special question connected with it; the Montefiore Gold Medal and £21, awarded in the same manner for Military Surgery; and the Montefiore Second Prize, consisting of works on Military Surgery, to the surgeon on probation who obtains the second highest numbers in this branch.

The Surgeon-Lieutenants of the British Medical Service at the close of the Netley courses of instruction pass on to Aldershot, where they go through a systematic course of instruction in ambulance drill and equitation. The Surgeons of the Indian Medical Service, who do not go to Aldershot, undergo, while at Netley, a special course of instruction in ambulance drill and duties.

Surgeon-Lieutenants, if recommended by the Director-General, Army Medical Department, are promoted to be Surgeon-Captains on completing three years' full pay service.

Surgeon-Captains, if recommended by the Director-General, are promoted to be Surgeon-Majors on completing twelve years' full-pay service, of which three must have been abroad. Before being promoted they will be required to pass an examination. This examination may be taken at any time after their seventh year of service.

The examination in Medicine and Surgery will be held by two gentlemen appointed by the Secretary of State; that in Hygiene by the Professor of Hygiene, Army Medical School, Netley; and that in Regulations, Duties, Military Law &c. by an administrative medical officer, nominated for the purpose by the Director-General.

The examination will embrace the following subjects: *a.* Surgery and Surgical Anatomy. *b.* Medicine and Pathology. *c.* Hygiene, within the limits treated of in "Parkes' Practical Hygiene;" also the regulations regarding the sanitation of garrisons, quarters, hospitals &c., as well as of camps and hospitals in the field, and of transports, troop and hospital ships. *d.* Duties of medical officers at home and abroad and at sea, as defined in regulations; also hospital organisation and administration in peace and war, including the transport of sick and wounded by land and sea. *e.* The administration, interior economy, command, and discipline of the Medical Staff Corps, together with a knowledge of the principles of military law and their practical application (unless a certificate of proficiency in military law has been obtained at a garrison class).

A certificate will be required from a recognised teacher of surgery in any medical school, at home or abroad, in which operative surgery is taught, showing that the medical officer has gone satisfactorily through a complete course of operative surgery during the period within which the examination must be taken, and that he is a competent operator.

A report on any subject of a practical professional character, to be selected by the officer himself, and certified to be his own composition and in his own handwriting, will also be required. Considerable importance will be attached to the literary and scientific merits of this report.

The examinations will be conducted by printed questions, which will enter so far into the subject matter of each head selected for examination as to show that the officer's knowledge has been fully tested.

The questions and answers will be forwarded, under a sealed confidential cover, to the Director-General for transmission to the examiners, who will report to the Director-General as to the competence of the officer examined.

Any higher qualification, such as M.D., F.R.C.S. &c., or any diploma in Hygiene and State Medicine, taken after the date of publication of these regulations, will not exempt surgeons from this examination.

Surgeon-Majors are, if recommended by the Director-General Army Medical Department, promoted to be Surgeon-Lieutenant-Colonels on completing twenty years full pay service.

The selection of Surgeons-Lieutenant-Colonel for advancement to the grade of Brigade-Surgeon-Lieutenant-Colonel is made on the grounds of ability and merit, in determining which the following points will be considered:—The officer to be so selected must have been favourably reported on by the several military and departmental officers under whom he may have served, as set forth in their Annual Confidential Reports. He must be physically fit for general service, and have the necessary qualifying foreign and Indian service under existing rules.

A Brigade-Surgeon-Lieutenant-Colonel, to be eligible for selection as Surgeon-Colonel, must have served abroad at least ten years, of which three must have been in India. All officers under the rank of Surgeon-Colonel are placed on the retired list at the age of fifty-five, and those of that rank and Surgeon-Major-General at the age of sixty, except that in any particular case in which it may be considered necessary for the interest of the public service, the age of retirement may be extended to sixty-two.

*Indian Medical Service.*—The alteration of titles of medical officers in the Indian Service, so as to assimilate them to those of the Army Medical Staff, was promulgated in a Royal Warrant dated Dec. 7th, 1891. The articles of

this Warrant were ordered to take effect from Aug. 7th, 1891, the date of the Medical Staff Warrant. By this Warrant the ranks of the medical officers in the Indian military forces were declared to be substantive ranks, and to carry with them the same precedence and other advantages as the corresponding ranks in the Army Medical Staff, including command over the medical officers and subordinates, native and European, engaged in hospital service. The functions of military command is subject to the same restrictions as in the British service. An important provision of this Warrant is that Surgeon-Lieutenants "shall be promoted" to the rank of Surgeon-Captain on completing three years' full-pay service, Surgeon-Captains to the rank of Surgeon-Major after twelve years' service, and Surgeon-Majors to the rank of Surgeon-Lieutenant-Colonels after twenty years' service. No examination to qualify for promotion is required. All promotions to higher grades are to be given by selection for ability and merit. In case of distinguished service in the field a medical officer may be at once promoted from any rank to the one next above it. The ages for compulsory retirement are the same as those for the Medical Staff.

Surgeons are promoted to Staff Surgeons after twelve years from date of entry, provided they pass the requisite examination; and Staff Surgeons to Fleet Surgeons after twenty years' service if recommended by the Director-General. Deputy Inspectors-General are promoted by selection from the Fleet Surgeons, and Inspectors-General from the Deputy Inspectors-General having three years' foreign, four years' mixed, of which not less than two have been abroad, or five years' home service in such appointments as preclude foreign service, provided they have not refused to go abroad when called upon to do so. Inspectors and Deputy Inspectors-General are retired compulsorily at sixty, and other grades at fifty-five years of age, and all ranks at any time if they have not served for five years. In calculating service for retired pay time on half-pay will be taken as equivalent to one-third service on full-pay.

The following tables, showing the rates of pay and half-pay of the three branches, will probably be acceptable to students who entertain any intention of entering the public service:—

ARMY.			
Rank.	Rates of Pay.	Gratuities.	With the Rank of

METROPOLITAN MEDICAL SCHOOLS HAVING A COMPLETE CURRICULUM.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.—The clinical practice of the hospital comprises a service of 750 beds, of which 676 are in the hospital at Smithfield and 75 are for convalescent patients at Swanley.

Eight house physicians and ten house surgeons are appointed annually, each of them holding office for one year, and provided with rooms by the hospital authorities. The ophthalmic house surgeon is appointed for six months, and is eligible for re-election for a second term of six months. A midwifery assistant is appointed every six months and an extern midwifery assistant every three months. The senior assistant chloroformist and junior assistant chloroformist are appointed annually, and are provided with rooms. Two qualified assistant electricians are appointed every three months. No fee is paid for any of these appointments, and each receives a salary of £25. The clinical clerks, the obstetric clerks, the clerks to the medical out-patients, the dressers to the surgical in-patients and to the out-patients, and the dressers in the special departments are chosen from the diligent students. All the appointments are now free.

A college is attached to the hospital, in which students can reside, subject to the college regulations.

Foundation and other Prizes.—Two Open Scholarships in Science of the value of £75 each, tenable for one year, will be competed for in September. Candidates must not be more than twenty-five years of age, and must not have entered to the medical or surgical practice of any metropolitan medical school. The subjects of examination are Physics and Chemistry for the one, Physiology and Biology for the other.—Two Junior Open Scholarships, one of £150

and one of £50, in the subjects of the Preliminary Scientific Examination of the London University, will be competed for at the same time. Candidates must be under twenty years of age, and must become regular students.—The Jeaffreson Exhibition, of the value of £20, is awarded at entrance after examination in the subjects of general education. It is now an Open Exhibition.—A Senior Scholarship, £50, in Anatomy, Physiology and Chemistry.—Kirke's Scholarship and Gold Medal in Clinical Medicine, value 40 guineas.—Lawrence Scholarship and Gold Medal, of the value of 40 guineas (founded in 1873 by the family of the late Sir William Lawrence).—Two Brackenbury Scholarships in Medicine and Surgery, £30 each.—Four Junior Scholarships in the subjects of study of the first year: 1st, £30; 2nd, £20; 3rd, £25; 4th, £15.

A prize of £15 for Anatomy has been founded by the late Mr. Henry Skynner, in memory of his brother; a Scholarship of £50 confined to Cambridge graduates in Arts, by Miss Shuter in memory of her brother, formerly assistant surgeon to St. Bartholomew's Hospital; and a prize of £10 10s. by Sir F. A. Burrows, Bart., in memory of his father, Sir George Burrows.

The Medical School Buildings include three large lecture theatres, a large dissecting room, a spacious library (containing 13,000 volumes) a well-appointed museum of anatomy, physiology, comparative anatomy, materia medica, botany and pathological anatomy. There are laboratories for chemistry, physiology, pathology, pharmacology, public health and biology, giving ample accommodation in every department.

Instruction in Preliminary Science is given to University of London students in chemistry, biology and physics throughout the year.

Laboratory Instruction for the D.P.H. is provided during the second half of the winter and in the summer sessions.

CHARING-CROSS HOSPITAL AND COLLEGE.—Total fees, 110 guineas if paid in a single sum on entry, or 121 guineas if paid in five instalments; for Dental students, 54 guineas, or 60 guineas in two equal instalments. General students pay proportionately lower fees, and are admitted without additional fee to the courses of Clinical Medicine and Surgery and to the practice of the Royal Westminster Ophthalmic Hospital. They alone are entitled to compete for the Scholarships, Gold Medal and Pereira Prize, excepting the Golding Scholarship of £15, for which Dental students can also compete.

Two Entrance Scholarships, of the value of 100 guineas and 50 guineas respectively, are awarded annually at the commencement of each winter session after a competitive examination in the following groups of subjects:—(1) English, including Language, Literature, History and Geography; (2) Latin and Greek; (3) French and German; (4) Mathematics, including Arithmetic, Algebra and Geometry; and Mechanics, including Statics and Dynamics; (5) Chemistry (Inorganic) and Physics, including Acoustics, Heat and Electricity; and (6) Animal and Vegetable Biology. The value attached to each group of subjects is 1000 marks. No candidate may offer himself for examination in more than three of the above groups of subjects, the selection of the groups being left entirely to the candidate. The Scholarships will be awarded by the School Committee to the two candidates who, on the report of the examiners, have shown the highest degree of excellence; but no Scholarship will be awarded unless, in the opinion of the examiners, a satisfactory standard has been attained. In the first four groups the subjects (as regards extent and the authors selected) will be the same as those chosen for the Matriculation Examination of the University of London in the June immediately preceding; in the fifth and sixth the same as those for the Preliminary Scientific Examination of the same University. Candidates must give notice to the Librarian of their intention to compete, and of the groups in which they offer themselves for examination, on or before Saturday, Sept. 17th, 1892. The examination will commence at the School on Monday, Sept. 19th, at 10 A.M. The successful candidates will be required to enter forthwith for their complete medical education at Charing-cross Hospital.

A Scholarship of the value of 50 guineas is open to students from the University of Oxford who have passed the First M.B. Examination, and to students of the University of Cambridge who have passed the Second M.B. Exa-

\* In Summer. † In Winter. ‡ Free to students of the hospital. § Winter and Summer.

mination, and who have not entered at any London medical school. Subjects: Anatomy and Physiology, including Histology. The examination for this Scholarship, which will be partly practical, will be held on Sept. 19th and 20th. Notice to compete must be sent in on or before Saturday, Sept. 17th, 1892. The successful candidate will be required to enter forthwith at Charing-cross Hospital for the completion of his curriculum. The Llewellyn Scholarship of £25, for students who have just completed their attendance on lectures; and the Golding Scholarship of £15, for both General and Dental students who have just completed their first year. The Pereira Prize of £5 is open to all general students, and is awarded annually for the best clinical reports. The Governors' Gold Medal is given for excellence in clinical work. Silver or Bronze Medals, or an equivalent in Books, are awarded to the most distinguished students in all classes; and special prizes in the classes of Dental Surgery, Physiology and Practical Histology. In consequence of the larger number of students year by year joining the school it was found necessary in 1889 to increase the accommodation for practical instruction. The adjoining premises were therefore acquired, and on the space thus gained there have now been erected new buildings, including physiological and pathological laboratories, a materia medica museum and an anatomical theatre. The existing dissecting-room and the chemical theatre have been enlarged. A larger and well-lighted room has been provided for the pathological museum and the space thus set free has been devoted partly to the enlargement of the library, but chiefly to the providing of a reading-room for the Students' Club.

Classes for the Preliminary Scientific Examination of the University of London are held at this Medical School. The fee for the whole course, which begins in October, is 15 guineas.

**ST. GEORGE'S HOSPITAL.**—Perpetual pupils, by payment of £150 in three instalments, or £145 in one sum, are entitled to admission to the medical and surgical practice; to compete for prizes and exhibitions; to hold the appointments of house physician and house surgeon, assistant house physician and assistant house surgeon, ophthalmic assistant, and to become clinical clerks for two periods of three months each, and dressers for similar periods, free of any charge. Gentlemen are admitted to the hospital practice and lectures required by the College of Physicians and Surgeons and the Society of Apothecaries on payment of £45 at the commencement of the first year of study, £45 at the commencement of the second year of study, £40 for the third and £20 for each subsequent year of attendance. On payment of the fourth instalment the pupil may become perpetual, provided that the Dean can certify that his conduct has been satisfactory. These payments entitle the pupil to hold the offices of clinical clerk and dresser for three months each, and to become a candidate for the offices of house physician and house surgeon. Perpetual pupils are eligible for the offices of curator of the museum, medical and surgical registrar, demonstrator of anatomy and obstetric assistant. These are all salaried offices. The obstetric assistant is resident, with a salary of £100.

**Entrance Scholarships.**—£145, open to sons of medical men; two of £50 each, open to all students commencing their medical studies; two of £65 each, open to students who have been signed up for or passed the Oxford First M.B. or Cambridge Second M.B.

**Prizes.**—The William Brown Exhibition of £100 per annum, tenable for two years, open to any perpetual pupil of St. George's who is under twenty-five years of age, and who shall have obtained a diploma or licence entitling him to be registered as a practitioner of medicine or surgery in England within two years previously to the period fixed for the examination (July). The examination is to test the proficiency of the candidate in Medicine, Midwifery and Surgery, including Ophthalmic Surgery.—The William Brown Exhibition of £40 per annum, tenable for three years, for general fitness for the exercise of the medical profession and for moral conduct, open to perpetual pupils in their third year of study.—Sir Charles Clarke's Prize (interest of £200 consols) for good conduct and for clinical work rendered in the service of the hospital; the Brackenbury Prize in Medicine, value £32; the Brackenbury Prize in Surgery, value £32; the Treasurer's Prize, £10 10s.; the Thompson Medal; the Brodie Prize for Clinical Surgery; the Acland Prize for Clinical Medicine; the Pollock Prize

in Physiology; the Henry Charles Johnson Prize in Anatomy; and General Proficiency Prizes, value £10 10s. each, for students of each year.

**GUY'S HOSPITAL.**—*Appointments:* House physicians, house surgeons, assistant house physicians and assistant house surgeons, obstetric residents, clinical assistants, surgeons' and assistant surgeons' dressers, surgical ward clerks, clinical clerks, post-mortem clerks, extern obstetric attendants and dressers and clerks in the special departments are appointed from among the students upon the recommendation of the medical staff, according to merit and without extra payment. The house physicians, of whom there are four, hold office for six months each. The assistant house physicians, who hold office for three months, attend in the Out-patient Department four afternoons in the week, and see all the cases not seen by the assistant physician of the day. The house physicians have the care of the patients in the medical wards, and attend to all emergencies arising in the absence of the physicians. They are provided with board and lodging in the college free of expense. The house surgeons, of whom there are four, hold office for six months each, and are provided with board and lodging in the college free of expense. The Surgical Casualty Department is in charge of two assistant house surgeons. The surgeons' dressers are selected from those students who have completed their third winter session, and have been most diligent in the junior appointments. They hold office for three or six months. Six are attached to each surgeon, and during their weeks of special duty they are provided with board and lodging in the hospital free of expense. The obstetric residents, two in number, are provided with board and lodging in the college free of expense.

*Scholarships, Prizes etc.*—Entrance Scholarships in Arts (£131 5s. and £52 10s.). Subjects: Latin, Greek, French, German and Mathematics.—Entrance Scholarships in Science (£131 5s. and £52 10s.). Subjects: Inorganic Chemistry, Zoology, Botany and Physics. The examination begins on Tuesday, Sept. 27th.—First-year students: First prize £50, second prize £25, for Anatomy, Physiology and Chemistry; the Arthur Durham Prize for Dissection, £5 to first-year students, £15 to those of later years.—For second-year students: First prize £25, second prize £10, for Anatomy, Physiology and Materia Medica. The Sands Cox Scholarship of £15 (tenable for three years) for Physiology. The Michael Harris prize of £10 for Anatomy.—For third-year students: First prize £25, second prize £10, for Medical and Surgical Anatomy, Midwifery and Therapeutics. The Beane Prize of 30 guineas for Materia Medica.—For fourth-year students: First prize £25, second prize £10, for Medicine, Surgery, Midwifery and Medical Jurisprudence. The Golding Bird Prize of £33 for Methods of Diagnosis in Disease.—For senior students: The Treasurer's Gold Medal for Clinical Medicine; the Treasurer's Gold Medal for Clinical Surgery; the Gurney Hoare Prize of £25 for Clinical Reports and Commentaries; and the Beane Prize of 30 guineas for Pathology. The Physical Society awards a prize of £5 to the author of the best Essay on a selected subject; a prize of £7 for the best paper read before the Society, and two prizes of £4 to the members who have most distinguished themselves in the debates of the session.

*Fees.*—1. A perpetual ticket, including admission to lectures, demonstrations and hospital practice, competition for prizes and eligibility for hospital appointments, may be obtained—(a) by the payment of £150 on entrance; (b) by two payments of £75 10s., one on entrance, the other at the commencement of the ensuing session; (c) by the payment of four annual instalments at the commencement of each academical year: first year £52 10s., second year £52 10s., third year £31 10s., fourth year £21. 2. A reduction is made in the fees for a perpetual ticket in the case of students who have spent one or more years at another medical school. Students entering as second-year students are charged for their first year at Guy's Hospital £52 10s., second year £42, third year £42, or £130 in one sum on entrance. Students entering as third-year students are charged for their first year at Guy's Hospital £52 10s., second year £31 10s., or £80 in one sum on entrance. This fee is payable by Cambridge students who have passed in Anatomy and Physiology at the Second M.B. Examination.

*The College.*—The College stands upon a site fronting the

east gate of the hospital, and is connected with it by a subway. The building has been planned to serve as a Residential College for Students, and at the same time to provide accommodation for the Students' Club.

**KING'S COLLEGE.**—The physicians' assistants, the physician-accoucheur's assistant, the ophthalmic clinical assistant, the senior clerks, and the house surgeons and senior dressers are selected by examination, whilst the junior clerkships and dresserships are appointed in order, in consideration of their former work in the medical school, from among these matriculated students. Rooms and commons are provided at the hospital for the resident officers free of charge. Rooms are provided within the walls of the College for the residence of matriculated students.

*Scholarships.*—Warneford Scholarships: Two of £25 per annum for three years for Literature. One additional Scholarship of £25 per annum for two years will be awarded this year. Science: One of £30 and one of £20 each for two years. Sambrooke: One of £60 and one of £40 for Science. Rabbeth Scholarship of £20 per annum for Science. College Scholarships: One of £40 per annum for two years; one of £30 for one year; three of £20 for one year. The Daniell Scholarship for Chemistry, of the annual value of £20. Sambrooke Registrarships, of the annual value of £50 each, and tenable for two years, are open to all matriculated students who have filled any one of the higher appointments of the hospital, or who have become Associates. The Leathes Prizes, value £7, and the Warneford Prizes, value £40, are given annually amongst the matriculated medical students. A Surgical Clinical Prize of £3 is given. The Todd Medical Clinical Prize consists of a bronze medal and books to the value of £4 4s. The Tanner Prize for Obstetric Medicine, value £10, and the Carter Gold Medal and Prize for Botany, value £15, are given annually in July. Class Prizes, value £3 3s. each, are awarded annually in every subject. A Warneford Scholarship of £25 per annum for two years for third-year subjects is awarded annually to resident students only.

**LONDON HOSPITAL AND COLLEGE.**—The Medical School of the London Hospital has lately been entirely remodelled and rebuilt. The present buildings were opened by their Royal Highnesses the Prince and Princess of Wales on May 21st, 1887, the accommodation now afforded being more than double that which was provided in the old buildings. The hospital, which is the largest in Great Britain, contains nearly 800 beds. Last year the number of in-patients was 9455, out-patients 112,092 and the number of accidents 1144.

The following Scholarships and Prizes will be offered for competition during the ensuing winter and summer sessions:—Two Entrance Scholarships in Natural Science, of the value of £75 and £50 respectively, will be offered for competition on September 28th, 29th, and 30th, 1892. The subjects are Physics, Botany, Zoology and Inorganic Chemistry. The successful candidates must forthwith become full pupils of the hospital and school, if not already entered, and are not eligible to compete for the Buxton Scholarships.—The two Buxton Scholarships, value £30 and £20, will be offered for competition on October 5th, 6th, and 7th, 1892. The subjects are those appointed by the General Council of Medical Education and Registration as the subjects of the Preliminary Examination.—A Scholarship, value £25, in Anatomy, Physiology, and Chemistry, will be competed for at the commencement of the summer session by first and second-year students.—A Scholarship, value £20, in Anatomy and Physiology, for first-year students. (At the end of the summer session.) The Letheby Prize, value £30, for proficiency in Chemistry. (At the end of the summer session.) Open to all full students who have completed their second summer session up to the termination of their fourth year from entrance.—A Hospital Scholarship, value £20, for proficiency and zeal in Clinical Medicine. (At the end of the winter session.)—A Hospital Scholarship, value £20, for proficiency and zeal in Clinical Surgery. (At the end of the winter session.)—A Hospital Scholarship, value £20, for proficiency and zeal in Clinical Obstetrics. (At the end of June.)—The Sutton Scholarship, value £20, in Pathology.—The Duckworth Nelson Prize, value £10, will be offered biennially for competition at the end of the winter session, and be open to all students on similar conditions to those of the Hospital Scholarships. The sub-

jects of examination will be Practical Medicine and Surgery.—The Hutchinson Prize, value £35, will be given triennially to the author of the best essay upon a subject in Clinical Surgery. Candidates must be full students of the hospital who have not been registered more than ten years.—Out-patients' Dressers' Prizes. Six prizes, of the aggregate value of £60, will be offered for competition at the end of the winter session. Candidates must pass an examination in Minor Surgery, and have dressed diligently for twelve months.—Practical Anatomy Prizes, value £6 and £4.

Special classes are held throughout the year for the Preliminary Scientific Intermediate M.B. Examinations of the University of London and for the Primary and Pass Examinations for the Fellowship of the Royal College of Surgeons. Special entries can also be made for Medical and Surgical Practice, the Operative Surgery classes &c.

Instruction is given throughout the year in all the details required for the diploma in Public Health.

In addition to the regular courses of lectures, there will be given during the winter and summer sessions a course of lectures on Clinical Medicine by Sir Andrew Clark, Bart., F.R.S., Emeritus Professor of Clinical Medicine, and a course of lectures on Clinical Surgery by Mr. Jonathan Hutchinson, F.R.S., Emeritus Professor of Clinical Surgery.

**ST. MARY'S HOSPITAL.**—There are three house physicians and three house surgeons, each appointed for six months, and two obstetric officers, each appointed for six months. They board free of expense in the hospital, except that the obstetric officer resides outside the hospital for the first three months. These appointments are awarded after competition, without additional fee. Two demonstrators of anatomy are appointed annually, with a salary of £70 and £50 respectively; and a demonstrator of physiology, at £100 a year. All these officers are eligible for re-election. There is also a demonstratorship in pathological anatomy twice annually, of the value of £15, and tenable for six months; the holder of this scholarship will assist the pathologist in the discharge of duties in the museum and deadhouse. Two prosectors of anatomy and two assistant demonstrators of physiology are appointed annually, and receive a certificate and £5 each for satisfactory service in their respective departments. All students are required to perform the duties of clinical clerk and dresser during the last two years of their curriculum. Students of the third year and of subsequent years are also appointed as clerks and dressers to assist the physicians and surgeons in charge of the out-patients. The hospital contains 281 beds. Two wards are appropriated to the Diseases of Children, and one to those of Women; beds are also provided for Ophthalmic, Aural, and Cutaneous cases. There is an out-patient department for diseases of children. Special assistance is given to intending candidates for the final examinations of the Medical, Surgical, and Obstetric tutors. The Clarence Memorial wing will contain (1) a new Out-patients' Department, (2) Lying-in Wards, (3) a Residential College for Medical Officers and Students, (4) additional Special Wards, (5) a Nurses' Home. This will add 100 beds to the Hospital, making 381 in all, at an estimated cost of £100,000. The prospectus may be had on application to Mr. F. H. Madden, the School Secretary, or to G. P. Field, Dean.

*Scholarships, Prizes, and Appointments: Scholarships offered for open competition previously to entering at the Medical School.*—Entrance Scholarships: The following will be offered for competition on Sept. 26th and 27th, at 10 A.M.—One Scholarship in Natural Science, of the value of 100 guineas, open to any gentleman who has not completed a winter session of study at a medical school. Three Scholarships in Natural Science, each of the value of 50 guineas, under the same conditions. One Scholarship, of the value of 125 guineas, open to students from Epsom College, being sons of medical men, and who have not completed a winter session of study at a medical school. This Scholarship is not given by competition. Two Scholarships, each of 50 guineas, open to students from the Universities of Oxford, Cambridge, or other University, who have not entered at any London medical school. The examination for the Scholarships will be conducted according to the syllabus of the Preliminary Scientific Examination of London University.

In addition to the Open Entrance Scholarships, Class Prizes, and usual Appointments, Scholarships will be offered for competition at the end of each year, open to all pupils.

These Scholarships are of the value of £20, £25, and £30 for the first, second, and third years respectively.

A residence for students, 33 and 35, Westbourne-terrace, W., in connexion with the hospital, is under the charge of a warden, Mr. E. Roughton, M.D., F.R.C.S., who is prepared to receive applications from students desiring to enter upon residence during the ensuing session. Terms: £60 for the academical year. Qualified medical men are admitted to unlimited attendance on hospital practice at a fee of £15 15s.

**MIDDLESEX HOSPITAL.**—The hospital contains 320 beds, and during the past year 3018 patients were treated in the wards, and 38,318 attended as out-patients. There is a special department for patients suffering from cancer, consisting of four wards, containing thirty-four beds; here cancer patients are received and attended for a period limited only by the duration of their disease.

The Medical School buildings have been reconstructed and very greatly added to quite recently, and are well provided with all necessary accommodation for students. The Museum is large and rich. Students can take out books from the extensive School Library and read them at their own homes.

*Scholarships &c.*—Two Entrance Scholarships of the value of £100 and £60 are offered for competition just before the commencement of each winter session. An Exhibition of £10 10s. is competed for by students at the close of their first winter session. The Hetley Prize of £25 and the Governors' Prize of £21 are open to competition among students at the close of their third year. The subjects of examination are Clinical Medicine, Surgery &c. The Lyell Gold Medal is awarded annually for proficiency in Surgical Anatomy and Practical Surgery. The Murray Gold Medal and Scholarship, founded in connexion with the University of Aberdeen, are awarded every third year to a student of this hospital; it will be next open for competition in May, 1895. Two Broderip Scholarships, of the value of £60 and £40, are awarded annually to those students in their fourth year who pass the best examination in Clinical Medicine, Clinical Surgery, and Morbid Anatomy. Valuable prizes are given in each class.

*Hospital Appointments.*—Clinical Clerkships and Dresserships in all departments are allotted to students without any extra fee. Eighteen Resident Appointments are annually filled from the pupils of the hospital, each appointment extending over six months.

*The Curriculum* is designed to meet the requirements of the Royal Colleges of Physicians and Surgeons and of the Universities of London, Cambridge &c. Special Classes are held to prepare students for the Preliminary Scientific M.B. (Lond.) Examination and for the Primary Examination for the diploma of F.R.C.S. Eng.

A *Residential College* to accommodate about thirty students adjoins the hospital. The charge for residence is £10 10s. and £8 8s. per term, according to the position of the room. Breakfast, luncheon, and dinner are supplied in the College Hall at a very moderate charge.

*Fees.*—The Composition Fee for the entire curriculum is 120 guineas, or 150 guineas if paid in three instalments. The fee for the Dental Curriculum is 54 guineas, or 60 guineas if paid in two instalments. Students from the Universities are received on special terms.

**ST. THOMAS'S HOSPITAL.**—*Prizes for the Year 1892-93.*—For First-year students: Two Entrance Scholarships in Natural Science of the value of £150 and £60 respectively, open to all first-year students, will be awarded during the first week in October, after an examination in Physics, Chemistry, and either Physiology, Botany, or Zoology, at the option of the candidate; the William Tite Scholarship, the proceeds of £1000 consols, is awarded each year; also prizes of £20 and £10; summer, £15 and £10. For Second-year students: The Peacock Scholarship of £38 10s., and the Musgrove Scholarship of £38 10s., are awarded biennially to the students who shall take the highest place in the first-class list in the examinations at the end of the second winter session; they are tenable for two years, provided the holder obtains a place in the first-class in the subsequent winter examination: making the winter prizes £38 10s. £20, and £10; summer, £15 and £10. For Third-year students (winter): Second tenure of Scholarship, £38 10s., and prizes of £20, £15, and £10; summer, £15 and £10. The Grainger Testimonial Prize

of £15 annually is awarded to students for original work in Anatomy and Physiology. The Cheselden Medal for Surgery and Surgical Anatomy, and the Mead Medal for Practical Medicine, are awarded annually to fourth-year students. The Beane Scholarship for Surgery and Surgical Pathology of the value of £52 10s., awarded biennially to students who have completed their fourth but not their sixth year. The Solly Medal, with a prize of from 10 to 20 guineas, will be awarded biennially to a student of the third, fourth, fifth, or sixth year, for the best report of surgical cases. The Treasurer's Gold Medal, for general proficiency and good conduct, is awarded annually to a fourth-year student. There are numerous appointments for students who have completed their courses.

*Fees.*—The composition fee to Hospital Practice and Lectures may be paid in the following ways:—1. £150 on entrance in one sum. 2. £157 10s. in instalments. (a) By two payments, £85 on entrance and £72 10s. at the beginning of the second year; (b) by three payments, £75 at the beginning of the first year, £50 at the beginning of the second year, and £32 10s. at the beginning of the third year; (c) by four payments, £65 at the beginning of the first year, £50 at the beginning of the second year, £30 at the beginning of the third year, and £12 10s. at the beginning of the fourth year. Gentlemen entering at St. Thomas's for Lectures and Hospital Practice of the second and subsequent years pay £130 on entrance or three instalments of £52 10s., £42, and £42. Students entering for Lectures and Hospital Practice of third and subsequent years pay a composition fee of £80, or £52 10s. on entrance, and £31 10s. one year subsequently. The fee for attendance on the general subjects required of students in Dental Surgery is for the two years £65, or, by instalments, £55 for the first year and £15 for the second year. If certificates for Dental Practice are also required, the special fee for that subject has to be paid.

**UNIVERSITY COLLEGE, LONDON.**—*Composition Fees.*—1. For the entire medical education required by the Examining Board in England and the Society of Apothecaries, 130 guineas, if paid in one sum at the commencement of the course, 135 guineas, if paid by instalments, as follows—first year, 60 guineas; second year, 50 guineas; third year, 25 guineas. 2. For those students who do not require to attend Chemistry, Pharmacy, and Elementary Biology at a medical school (under the regulations of the Examining Board in England) the fee will be—112 guineas, if paid in one sum; 117 guineas, if paid by instalments, as follows—first year, 50 guineas; second year, 40 guineas; third year, 27 guineas. 3. For the whole course of instruction for the Intermediate Examination in Medicine of the University of London, 50 guineas. 4. For the course of instruction for the Final M.B. Examination of the University of London, 70 guineas, if paid in one sum; 72 guineas, if paid by instalments, as follows—first year, 40 guineas; second year, 32 guineas. 5. Composition fee for Dental Students, 65 guineas. 6. Composition fee for the whole course of instruction for the Preliminary Scientific (M.B.) Examination of the University of London, 34 guineas.

*Exhibitions, Prizes, &c.*—Three Entrance Exhibitions, of the respective values of £100, £60, and £40 per annum, tenable for one year, are annually awarded, upon examination by printed papers, to gentlemen who are about to commence their first winter attendance in a medical school. The subjects of the examination are—Chemistry, Physics, Botany, and Zoology. The Atkinson Morley Surgical Scholarship of £45, tenable for three years, is annually awarded to the student who, upon examination, is found to possess the greatest proficiency in the Theory and Practice of Surgery. The Sharpey Physiological Scholarship of about £105 per annum. Filler Exhibition: a prize of £30 is awarded annually, in July, to the most proficient student in the class of Pathological Anatomy. An Atchison Scholarship, value about £55 per annum, tenable for two years. The Cluff Memorial Prize, value about £15, every second year to the most proficient in Anatomy, Physiology, and Chemistry. The Erichsen Prize: a surgeon's operating case of the value of £10 10s., awarded yearly to the student of the class of Practical Surgery who shall most distinguish himself by manipulative skill. The Morris Bursary of £16 a year, tenable for two years. Besides the above, gold and silver medals and other prizes are awarded in each class.

Several professors and other gentlemen connected with the College receive students to reside with them; and in

the office of the College there is kept a register of persons unconnected with the College who receive boarders into their families; among these are several medical gentlemen and clergymen.

The annual dinner of the old and present students of the Faculty of Medicine will be held at the Hôtel Métropole on Thursday, Oct. 1st, at 6.30 P.M. Sir G. Buchanan, M.D., will preside.

**WESTMINSTER HOSPITAL.**—The hospital contains upwards of 200 beds. There are separate departments for Diseases of the Eye, Ear, Skin, Teeth, and Throat, for Orthopædics, and for Diseases of Women, and a special ward for Children. The Anatomical Museum is constantly open to the students. There are also a Pathological Museum and a Materia Medica Museum.

A curator of the museum and a pathologist, with salaries of £40 and £50 respectively, and a medical and surgical registrar, each with a salary of £40, are appointed annually. Two house physicians, two house surgeons, and a resident obstetric assistant are appointed for six months after examination, and are provided with rooms and commons. Clinical assistants to the physicians and surgeons, and to the officers in charge of special departments, are appointed from among qualified students of the hospital.

*Preliminary Scientific and Intermediate (M.B.) Examinations of the University of London.*—Arrangements have been made for holding classes in the subjects of the Preliminary Scientific (M.B.) Examination. The total fees for these will be 12 guineas. Students will also be required to attend the Lectures on Chemistry and Practical Chemistry delivered in the School, the fees for which, 6 and 4 guineas respectively, will be a first instalment of the General Composition Fees. These classes will commence in October. Special classes for the Intermediate M.B., and for the First F.R.C.S. Examinations will be held, also commencing in October. For these, an extra fee of 10 guineas will be charged for the former and 7 guineas for the latter. Anatomy, Mr. Black and Mr. Stonham; Physiology, Dr. Abraham; Chemistry, Dr. Hake; Materia Medica, Dr. Murrell. Any of the above classes are open to other than Students of the School, on conditions to be learned on application to the Dean.

*Scholarships and Prizes.*—A Science Scholarship, value £60, is offered annually; the Guthrie and Entrance Scholarships, on alternate years, value £60; a Senior Scholarship, value £40, to Oxford and Cambridge students; and Two Entrance Scholarships, value £40. Entrance Scholarship, summer session, value £40. A £20 Entrance Scholarship is offered annually to Dental students. The Treasurer's Prize, an Exhibition in Anatomy, Physiology, and Chemistry, value £10 10s., tenable for one year, for first-year men. The President's Prize, a Scholarship in Anatomy, Histology, and Physiology, value £21, given by his Grace the Duke of Westminster, President of the Hospital, to a student of the second year (to be styled Assistant Demonstrator). At the end of the fourth winter session, prizes of £5 each (books or instruments) in Clinical Medicine and Clinical Surgery. Frederick Bird Medal and Prize, value £15. Subjects of examination: Medicine, Midwifery, Diseases of Women and Children, and Pathology. Chadwick Prize for General Proficiency, £21 (books or instruments), to the most meritorious student or students of any year not exceeding the fifth. In most of the classes special prizes, value about 2 guineas each, are given.

**LONDON SCHOOL OF MEDICINE FOR WOMEN, 30, Handel-street, Brunswick-square, W.C.**—The winter session of this School, which is in connexion with the Royal Free Hospital, Gray's-inn-road, will begin on Oct. 1st, 1892, and will end on March 1st, 1893. The summer session will begin on May 1st, and will end on July 31st, 1893. No student will be admitted to the study of Medicine who has not completed her eighteenth year. The admission of students rests exclusively with the Executive Council.

*Scholarships and Prizes.*—The Executive Council offers annually a Scholarship of £30 to women preparing for the medical profession. The following scholarships will be offered for competition on Sept. 22nd and 23rd, 1892:—1. The Scholarship, value £30, open to all candidates who have passed a preliminary examination in Arts recognised by the General Medical Council. 2. The Jubilee Scholarship, value £25 a year for four years, open only to candidates willing to practise in India under the Countess of Dufferin's Fund. The Stuart Mill

Scholarship is offered once in four years to ladies willing to practise Medicine in India in connexion with the National Association for Supplying Female Medical Aid to the Women of India. The United Kingdom Branch of the National Association for Supplying Female Medical Aid to the Women of India also provides funds for the Dufferin and Jubilee Scholarships, each of the value of £25 a year for four years, at the School, to students who will enter into a legal arrangement to practise in India under the Countess of Dufferin's Fund on the completion of their course of study. The Gilchrist Trustees offer a Scholarship of £50 a year for five years to the student of the School who takes the highest position in the Preliminary Scientific M.B. Examination of the University of London. Three Scholarships, each of the value of £100 a year for three years, will be offered yearly to girls under nineteen years of age on the first day of the examination, whose parents reside within the metropolitan area as defined in the Elementary Education Act, by the trustees of the St. Dunstan's charities. The holders must fit themselves for the practice of a profession, medical or otherwise. The Scholarships will be tenable at any place of higher education approved by the governors. The Helen Prideaux Memorial Fund (£505) has been invested, and the income derived from it will be given as a prize every second or third year to a graduate of the School, for the further prosecution of her medical studies, at the discretion of the trustees. There is also a small fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help, to obtain additional experience in operative midwifery. Prizes and Certificates of Honour are awarded in each class at the end of the session. The Wood Prize for Operative Midwifery, value £5 5s., will be offered at the end of the winter session, 1892. Secretary, Miss Heaton.

#### METROPOLITAN ANCILLARY SCHOOLS OF MEDICINE.

THE following institutions offer a partial curriculum in the form of classes dealing with particular subjects, or adapted to special circumstances.

**BETHLEM HOSPITAL.**—This hospital is open for the admission of two Resident Clinical Assistants who have recently obtained their diplomas to practise Medicine and Surgery. They will be permitted to reside in the hospital for a term generally not exceeding six months, and will be provided with such apartments, rations, and attendance as the Committee shall consider reasonable. They will be under the direction of the Resident Physician, and will be elected by the Committee from candidates whose testimonials appear to be most satisfactory. A limited number of medical students who have completed the third year of study are allowed to attend the practice of the hospital free, and qualified practitioners may attend for a period of three months on payment of a fee.

**HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.**—Four House Physicians reside in the hospital for a period of six months. Pupils are admitted to the practice of the hospital; terms £1 ls. for one month; six months £5 5s.; perpetual £10 10s. Lectures and Clinical Demonstrations are given throughout the year by members of the medical staff on Wednesdays and Fridays at four. The medical practice of the hospital is recognised by the University of London, the Apothecaries' Society, and the Army and Navy and Indian Medical Boards. The hospital contains 321 beds in the two buildings.

**CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria-park.**—During the past year 1236 in-patients have been admitted, and the large number of 25,500 cases have been treated since the opening of the wards in 1855. The number of out-patients treated during 1891 was 15,529, and 489,890 since the commencement of the institution in 1848. Information as to medical instruction can be obtained on application to the Secretary of the Clinical Sub-committee at the hospital. Consulting Physicians: Drs. J. Andrew and E. L. Birkett. Consulting Surgeon: Mr. J. Eric Erichsen, F.R.S. Physicians: Drs. J. C. Thorowgood, Eustace Smith, G. A. Heron, Vincent D. Harris, J. A. Ormerod, and E. Clifford Beale. Surgeon: Mr. J. F. C. H. Macready, F.R.C.S. Assistant Physicians: Drs. Harrington Sainsbury, T. Glover Lyon, Sir Hugh R. Beevor, Bart., W. J. Hadley, and E. H. Colbeck.

**CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's-inn-road.**—The hospital contains accommodation for seven-

teen in-patients, and has a very extensive out-patient department, which is open to all medical practitioners and students for the purpose of clinical demonstration and instruction during the hours of the surgeons' visits. During the past year 6250 out-patients and 288 in-patients were treated. Fee for three months' attendance, 3 guineas; for six months, 5 guineas. A course of lectures on the special diseases treated at this hospital will be delivered during the winter months by members of the staff. The date of these lectures is announced in the medical journals prior to their commencement. They are free to qualified practitioners and advanced students of medicine. Consulting Surgeon: Mr. Thomas Nunn. Surgeons: Mr. Lennox Browne, Dr. Arthur Orwin, Dr. Dundas Grant, Mr. Percy Jakins, and Mr. T. W. Carmalt Jones. Assistant Surgeon: Mr. Walter Fowler and Mr. Wyatt Wingrave. Registrar and Pathologist: Dr. Holloway. Dental Surgeon: Mr. George Wallis. Defects of Speech: Mr. William Van Praagh. Secretary: Mr. Richard Kershaw.

ROYAL HOSPITAL FOR CHILDREN AND WOMEN, Waterloo-bridge-road (instituted 1816).—Consulting Physicians: Dr. Wilks, Dr. John Williams, Dr. G. V. Poore, and Dr. Geo. Roper. Consulting Surgeon: Arthur Durham. Physicians: Drs. W. Gow, Alex. Haig, Septimus Sunderland, and S. W. Wheaton. Surgeon: Mr. H. C. Jacobson. Surgeon-Dentist: Mr. Alfred Barnard. Resident Medical Officer: Dr. Richards. Assistant Surgeon: Marmaduke Sheild. Secretary: Mr. R. G. Kestin. Advanced students in Medicine, and such practitioners as may desire it, are permitted to attend the practice of this hospital gratis. If a certificate signifying such attendance be required, the sum of £5 5s. must be paid to the physicians and surgeons in ordinary conjointly. Anaesthetist and Registrar: Dr. Fisher. Consulting Surgeon-Dentist: Mr. Walter Whitehouse.

HOSPITAL FOR WOMEN, Soho-square, W.—In connexion with this institution there has been for some years a well-organised Clinical Department, which has lately been enlarged under the title of the London School of Gynaecology. To meet the want increasingly felt by medical men of an accurate knowledge of the ordinary diseases of women, gentlemen are appointed every three months to act as clinical assistants to the physicians and surgeons seeing out- and in-door patients. The appointments are nominally "open to qualified medical men and to students of medicine after their third year," but in the selection of candidates preference is naturally given to gentlemen already engaged in practice. The large numbers of out-patients afford quite unrivalled opportunities for practical instruction in the use of gynaecological instruments, and for the study of diseases peculiar to women. A course of lectures on the Anatomy and Physiology of the Female Pelvic Organs is given during each quarter by a member of the Staff. Clinical lectures are given in the Operating Theatre on alternate Thursdays, throughout the winter and summer sessions. Valuable prizes are given, after examination, annually, open to past and present clinical assistants. Fee for the three months' course, £8 8s. Any further information can be obtained by letter addressed to the Dean at the hospital.

COOKE'S SCHOOL OF ANATOMY.—The school having been recognised by the London University and the Society of Apothecaries, a department for Curriculum work has been formed, in which instruction is given meeting the requirements of the first two years of medical studies. Special advantages are offered in regard to practical work in Anatomy and Physiology, on the lines in respect of the former subject of Mr. Cooke's "Dissection Guides." It is intended, however, in regard to the Curriculum to take on only a small number of earnest workers, the object being to attract men who, on their becoming efficient in practical work, will be able to act as prosecutors and physiological assistants to the school, and thus to take part in the "Supplementary Teaching," which is the main feature of the institution. In encouragement of such the Bland Subton Scholarship is offered, conferring the privilege of free education for the first two years of the Medical Curriculum. By decision of the Royal Colleges of Physicians and Surgeons, gentlemen rejected at their Anatomical and Physiological Examinations (Primary R.C.S., or Second Conjoint) can get "signed up" from this school for the three or six months' supplementary work they are now required to put in before re-examination. This school is also intended to meet the requirements of qualified practitioners and advanced students—i.e., gentlemen

wishing either to obtain some of the higher qualifications, or to compete for appointments in Her Majesty's Army, Navy, and Indian Medical Services. The instruction is given on the dissected and undissected body, with normal and pathological specimens, microscopical preparations, chemical, physiological, and surgical apparatus, splints, &c. The school possesses a good collection of physiological apparatus, allowing of the demonstration to the class of the great bulk of the usual practical exercises in Physiology; also chemical apparatus, allowing every student not only so see, but to repeat for himself, the analysis of the principal food-stuffs, and fluids and solids of the body, and also all the usual reactions, tests, &c. Gentlemen preparing for the Higher Examinations receive special instruction in the more difficult subjects, and have the advantage of personally repeating the practical exercises in Physiology above alluded to. The operations of Surgery are performed by the students on the dead body. Private address: 40, Brunswick-square, W.C.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City-road. (Established 1814.)—This hospital has recently been enlarged by the addition of a very complete out-patients' department, and also by the erection of a new wing, which provides accommodation for 80 in-patients. Expenditure for 1891, £6322; income (including legacies), £7880.

ROYAL EAR HOSPITAL, Frith-street, Soho-square, W. (Founded 1816, for the special treatment of Diseases of the Ear.)—During 1891, 153 in-patients and 2742 out-patients were treated; attendances 8297. The clinique of the hospital is open to medical practitioners and advanced students by previous arrangement with the Secretary. Surgeons: Urban Pritchard, M.D., F.R.C.S., Farquhar Matheson, M.B., C.M., and G. L. Cheate, F.R.C.S. Secretary: M. C. Puddy.

GRANT NORTHERN CENTRAL HOSPITAL, Holloway-road. Consulting Physician: Sir Andrew Clark, Bart., M.D. Consulting Surgeons: Sir W. S. Savory, Bart., and William Adams. Physicians: Drs. Cholmeley, Burnet, Beale, Beevor, Syers, and Galloway. Obstetric Physicians: Drs. W. S. A. Griffith and L. Remfry. Surgeons: Messrs. J. Macready, C. B. Lockwood, H. W. Allingham, P. T. B. Beale, and Raymond Johnson. Ophthalmic Surgeon: Mr. A. Stanford Morton. Aural Surgeon: Mr. W. R. H. Stewart. Throat Department: Mr. W. Spencer Watson. Skin Department: Dr. Cook. Dental Surgeon: Mr. Traer Harris. The new buildings in the Holloway-road have been recently erected, and the practice of the hospital is open to qualified practitioners and senior students. Clinical assistants are appointed in the wards and out-patient department. Further information can be obtained on application to the Hon. Secretary of the Medical Committee, Dr. Syers, 3, Devonshire-street, W.

LONDON TEMPERANCE HOSPITAL, Hampstead-road, N.W. (Established 1873.)—Physicians: Dr. E. W. Richardson, F.R.C.P., F.R.S.; Dr. J. J. Ridge. Surgeon: Dr. W. J. Collins, F.R.C.S. Dental Surgeon: Mr. A. Alexander. The hospital contains 110 beds. The in-patients average 750 and the out-patients 3500 a year. The medical and surgical practice of the hospital is open to students and practitioners. Special departments for Ophthalmology and Gynaecology. Operations, Mondays and Thursdays, 3.30. Classes will be held during the winter and summer sessions for students preparing for the final examinations at the Colleges and the Universities. Appointments, vacancies for which are advertised in the medical journals: Registrar and Pathologist; Senior and Junior House Surgeons. For particulars as to hospital practice and classes apply at the hospital to Dr. W. J. Collins.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC (Albany Memorial), Queen-square, Bloomsbury.—The new hospital, with the Finchley branch, contains 170 beds and cots. The physicians attend every Monday, Tuesday, Wednesday, and Friday, at 2.30 P.M. In- and out-patient practice and electrical-room treatment at that hour. Physicians: Drs. Ramskill, Hughlings Jackson, Buzzard, and Bastian. Physicians for Out-patients: Drs. W. R. Gowers, D. Ferrier, Ormerod, and Beevor. Assistant Physicians: Drs. James Anderson and Tooth. Surgeons: Messrs. Victor Horsley and C. A. Ballance. Ophthalmic Surgeons: Messrs. R. Brudenell Carter and Marcus Gunn. Aural Surgeon: Mr. A. E. Cumberbatch. Laryngologist: Dr. Felix Semon. Anaesthetist: Dr. Dudley Buxton. Pathologist and Registrar: Dr. Taylor. House Physicians: Drs. Bowman and Wood. Medical practitioners and senior students may attend the practice after signing their names in the clerk's office. The

new wing, containing a clinical theatre and operating room, two small wards for surgical cases, a surgeons' room, an anæsthetic room, and together with a library and museum, is now completed.

**QUEEN CHARLOTTE'S LYING-IN HOSPITAL AND MIDWIFERY TRAINING SCHOOL, Marylebone-road, N.W.**—Consulting Physician: Dr. Brodie. Consulting Surgeons: Mr. H. Lee and Sir William Mac Cormac. Physicians to In-patients: Dr. W. Hope and Dr. W. C. Grigg. Physicians to Out-patients: Dr. W. S. A. Griffith and Dr. W. Rivers Pollock. This hospital, which has been recently enlarged, receives nearly 1000 patients annually, besides having a large out-patient department. Medical pupils are received at all times of the year. Pupils have unusual opportunities of seeing obstetric complications and operative midwifery, on account of the very large number of primiparous cases—upwards of three-fourths of the total admissions. Clinical instruction is given on the more important cases which present themselves. Certificates of attendance at this hospital are recognised by all universities, colleges, and licensing bodies. Pupil midwives and monthly nurses are received and specially trained. Fees: Medical Students, £3 3s. for one week; £5 5s. for two weeks; £6 16s. 6d. for four weeks, exclusive of board and lodging. Pupil Midwives, £26 5s. for three months; Pupil Nurses, £15 15s. for twelve weeks, and £11 0s. 6d. for eight weeks; these include board and lodging. For further particulars, application should be made to Mr. G. Owen Ryan, Secretary, at the Hospital.

**SEAMEN'S HOSPITAL SOCIETY, Dreadnought Hospital, Greenwich, S.E. (235 beds).**—Royal Victoria and Albert Dock Hospital, E. (18 beds). Dispensaries: East India Dock-road, E., and Gravesend. This institution is established for the relief of seamen of all nations. Casualties are received at all hours. Apartments are provided in the house of the Principal Medical Officer for students. Honorary Consulting Physicians: Dr. Robert Barnes, F.R.C.P., and Sir Richard Quain, Bart., F.R.C.P. Visiting Physicians: Dr. John Curnow, F.R.C.P., and Dr. John Anderson, C.I.E., M.R.C.P. Visiting Physician to the Royal Victoria and Albert Dock Hospital: Dr. Patrick Manson, LL.D., M.R.C.P. Honorary Consulting Surgeon: Mr. J. N. Davies-Colley, F.R.C.S. Visiting Surgeon: Mr. G. Robertson Turner, F.R.C.S. Principal Medical Officer: Mr. W. Johnson Smith, F.R.C.S. Ophthalmic Surgeon: Mr. D. S. Gunn, F.R.C.S. House Physician: Dr. M. Spencer, M.R.C.P. House Surgeon: Mr. Arthur Jervis, M.B., B.S., M.R.C.S. Branch Hospital:—House Surgeon: Dr. C. H. Preston, L.R.C.P. Junior House Surgeon: Dr. Frank L. Wod, Ch.B. Gravesend Dispensary:—Surgeon: Mr. O. R. Richmond. Secretary: Mr. P. Micelli.

**HOSPITAL FOR SICK CHILDREN, Great Ormond-street, Bloomsbury, W.C., and Cromwell House, Highbate.**—The hospital contains 127 beds, and 52 beds at the country branch, forming a total of 179. There are ten Clinical Clerkships, and the number will shortly be increased to sixteen, tenable by all students who have taken out a ticket for the hospital. Senior students should not forget that there is here a thoroughly organised system of clinical instruction both in the medical and surgical wards. Lectures are given at intervals by members of the staff. The hospital offers great facilities for post-graduate teaching and for hospital practice.

**ROYAL LONDON OPHTHALMIC HOSPITAL, Moorfields.**—The hospital, founded in 1804, and considerably enlarged in 1876, now contains 100 beds for patients, which were occupied during last year by 1892 persons. The out-patients are yearly over 25,000; attendances, 109,756 in 1891. Operations are performed daily from 10 to 1 o'clock, and three surgeons attend on each day. Students are admitted to the practice. Fee for six months, £3 3s.; perpetual, £5 5s. Classes, demonstrations, and lectures are periodically given, to which perpetual students are admitted free. Students of the hospital are eligible for the office of house surgeon, or may be appointed clinical and junior assistants. The Secretary, Mr. Robert J. Newstead, will furnish further information, as may be desired.

**ROYAL WESTMINSTER OPHTHALMIC HOSPITAL, King William-street, West Strand.**—The hospital contains 50 beds; and the patients, who number 10,000 annually, are seen at 1 o'clock, and operations performed daily at 2 o'clock. The following are the days of attendance of the surgeons: Mr. Power and Mr. Rouse (Consulting Surgeons); Mr. Cowell and Mr. Juler, Wednesday and Saturday; Mr. Mac-

namara and Mr. Wainwright, Tuesday and Friday; Mr. Earbridge, Mr. Frost, and Mr. Dodd, Monday and Thursday. The practice of the hospital is open to practitioners and students. Fees for six months, £3 3s.; perpetual, £5 5s. Students of the hospital are eligible for the post of house surgeon. Special demonstrations and lectures will be given during the session, commencing in October; for details see weekly journals. Clinical Assistants (who must be duly qualified) to the Surgeons are appointed for periods of six months. Secretary: Mr. T. Beattie-Campbell.

**ROYAL ORTHOPÆDIC HOSPITAL, 297, Oxford-street.**—Surgeons: Messrs. B. E. Brodhurst, H. A. Reeves, and Charles Read. Assistant Surgeon: Mr. H. F. Baker. House Surgeon: Mr. C. Ernest Baker. Secretary: Mr. Maskell. Operations on Mondays at 2 P.M. The hospital is open to all legally qualified practitioners. Pupils are admitted to witness the practice of the hospital on the following terms: six months, £3 3s.; twelve months, £5 5s.; perpetual, £10 10s.

**ST. PETER'S HOSPITAL FOR STONE AND URINARY DISEASES, Henrietta-street, Covent-garden.**—Established 1860. New Hospital built 1882. Honorary Surgeons: Mr. F. R. Heycock, Mr. F. Swinford Edwards, Mr. E. Hurry Fenwick, Mr. Reginald Harrison. Pathologist: Mr. E. Hurry Fenwick. The hospital contains 24 beds and 3 private wards. Consultations are held and operations are performed each Wednesday and Friday at 2 P.M. A course of lectures upon Urinary Diseases is delivered every year by members of the staff, whilst clinical instruction in the wards and out-patient department is given daily throughout the year. The attendance of practitioners and senior students is invited. A limited number of clinical assistants is appointed to the out-patients.

**COLLEGE OF STATE MEDICINE, 101, Great Russell-street, W.C.**—The usual three and six months' courses in Hygiene and Public Health by Professor A. Wynter Blyth will be given during the winter session. The Public Health and Bacteriological Laboratories will be open daily from 10 to 4 P.M. from Monday, Oct. 3rd. Gentlemen can obtain tickets for either laboratory, or enter for a three or six months' course. Provision is made for gentlemen undertaking original research.—*Research Scholarship*: A Scholarship of the value of £100 for one year will be awarded to the candidate best qualified to carry out an original research by the use of bacteriological and chemical methods. Applications should reach the Honorary Secretary not later than Oct. 15th. Candidates must be prepared to conduct their work in the College laboratories, and devote five hours a day to the same. For further particulars address the Hon. Secretary, W. Robert Cornish, Esq.

**VOLUNTEER MEDICAL STAFF CORPS (LONDON COMPANIES), 62, St. Martin's-lane.**—Hon. Commandant: Surgeon-General Sir William Guyer Hunter, K.C.M.G., M.P., Q.H.S. Commandant: Surgeon-Lieutenant-Colonel A. T. Norton. The Volunteer Medical Staff Corps bears the same relation to the Volunteer Army as the Medical Staff Corps bears to the regular Army. The course of training has the great advantage of affording, in addition to a knowledge of ordinary military duties, special ambulance instruction useful in all ranks of life. All who have gone through the ranks of this corps are capable of rendering valuable aid in any accident, and in cases of emergency may be the means of saving lives which would otherwise be lost. In addition to the Company and Battalion drills of an ordinary infantry corps, the special training includes stretcher, waggon, and litter drill; the use of improvised seats and stretchers; the use and application of bandages, splints, &c.; lectures by the officers on first aid to the injured, and on the elements of anatomy, physiology, hygiene, and nursing. There is also a Shooting Club in the Corps, in which instruction in and facilities for practice of rifle shooting is given. Lectures are delivered during the winter session. The Adjutant, Surgeon-Captain J. P. S. Hayes, will give any information respecting the above on application to the head-quarters, 62, St. Martin's-lane, W.C.

**SCHOOL OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.**—Chemistry: Professor Dunstan, M.A., F.I.C. Practical Chemistry: Professor Atfield, Ph.D., F.R.S., F.I.C. Botany: Professor Green, M.A., B.Sc., F.L.S. Materia Medica: Mr. Greenish, F.I.C., F.L.S. Practical Pharmacy: Mr. Joseph Ince, F.L.S. The session commences on Wednesday, Oct. 5th, at 10 A.M. Medical students, or pupils intending to enter the medical profession, are admitted to the lectures &c., and to courses of Practical Chemistry. Application for admission to the school, or for further information, may be

made to the Dean of the school, Professor Dunstan, 17, Bloomsbury-square, London, W.C. The introductory address will be delivered on Wednesday, Oct. 5th, at 3 P.M.

**CITY SCHOOL OF CHEMISTRY AND PHARMACY, LIMITED,** 27, Chancery-lane, W.C.—This school was established in 1882 for the advancement of pharmaceutical education. Lecturers and Demonstrators: Mr. Maurice Williams, Principal; Mr. Thomas A. Ellwood, F.I.C., F.C.S. &c.; Mr. Martin J. Cole, Microscopist; Mr. Herbert J. Killick, Curator. Subjects: Theoretical and Practical Chemistry, Chemical Physics, Theoretical and Practical Pharmacy, Materia Medica and Therapeutics. Lectures and Demonstrations are given daily by the Principal, and the student is allowed unlimited laboratory and pharmacy practice. Application for particulars should be made to the Principal.

**SOUTH LONDON SCHOOL OF PHARMACY, LIMITED.**—This school was established in 1868 and incorporated in 1888 as a public company. The managing director is Dr. John Muter, M.A., F.R.S.E., F.C.S., F.I.C., who lectures on Chemistry, Physics, and Botany. The other lecturers are: Mr. W. H. Dodd, F.C.S. (Materia Medica and Pharmacy); Mr. L. De Koningh, F.I.C., F.C.S. (Analytical Chemistry); assisted by a staff of competent demonstrators. The department most valuable to medical students is the Medical and General Science Tutorial Department. The subjects taught are: For First B.Sc. and Preliminary Scientific: Inorganic and Practical Chemistry. For First M.B.: Organic Chemistry, Analysis and Pharmaceutical Chemistry and Materia Medica. For Apothecaries' Hall and the Conjoint Colleges: Chemistry, Botany, and Materia Medica. For Pass M.B. Lond.: Practical Toxicology and Forensic Medicine. For Sanitary Science qualifications: Practical Chemistry and Microscopy. Particulars as to fees may be had from the Secretary, 325, Kennington-road, London, S.E.

**MIDDLESEX COLLEGE OF CHEMISTRY AND PHARMACY,** 40, Charlotte-street, Portland-place, W.—The special classes for medical students in Chemistry, Materia Medica, and Pharmacy started two years ago have proved very successful. The premises, which were erected by the late Dr. W. de la Rue, F.R.S., are well suited for the purpose for which they are used.

**ROYAL COLLEGE OF SCIENCE** (with which is incorporated the ROYAL SCHOOL OF MINES).—Biology: Professor Huxley, Mr. Howes and (up to Sept. 22nd) Dr. Scott. Chemistry: Dr. Thorpe and Mr. Wynne. Physics: Professor Rücker. Geology: Professor Judd. The arrangement which this school had with certain hospitals has fallen through, and the courses are no longer available for their purpose.

**BIRKBECK LITERARY AND SCIENTIFIC INSTITUTION,** Bream's-buildings, Chancery-lane.—Special arrangements have been made for the instruction of students in Chemistry, Biology and Experimental Physics, in conformity with the requirements of the Intermediate and Final B.Sc., the Preliminary Scientific and the Intermediate M.B. Examinations of the University of London. The lectures will be fully illustrated by experiments, and provision will be made for individual practical work in each subject. For particulars apply to the Secretary.

#### HOSPITALS AFFORDING FACILITIES FOR CLINICAL OBSERVATION.

**ALL SAINTS CHILDREN'S HOSPITAL,** 4, Margaret-street, and 59, Mortimer-street, W.—Founded by the All Saints Sisterhood in 1882 for Incurable Diseases. Twelve beds for boys and eight for girls under the age of ten years.

**EAST LONDON HOSPITAL FOR CHILDREN AND DISPENSARY FOR WOMEN,** Glamis-road, Shadwell, E.—Physicians: Dr. Eustace Smith, Dr. Horatio B. Donkin and Dr. J. A. Coult. Surgeons: Mr. R. W. Parker and Mr. L. A. Dunn. Assistant Physicians: Dr. Dawson Williams and Dr. H. T. Campbell. Assistant Surgeon: Mr. H. B. Robinson. Administrator of Anæsthetics: Mr. Thomas Bird. Resident Medical Officer: Dr. Ernest Hare. House Surgeon: Dr. Crosby. House Physician: Mr. G. Norman. Secretary: Samuel Whitford. Lady Superintendent: Miss F. A. Davies. The hospital maintains 102 cots, and on an average 125 out-patients are seen daily.

**EVELINA HOSPITAL FOR SICK CHILDREN,** Southwark-bridge-road, S.E.—Consulting Physicians: Dr. W. S. Playfair, Dr. James F. Goodhart and Dr. Fredk. Taylor. Consulting Surgeons: Mr. W. Marrant Baker and Mr. H. G. Howse. Physicians: Drs. Nestor Tirard, Fred. Willcocks,

G. A. Carpenter and W. Soltau Fenwick. Surgeons: Messrs. R. Clement Lucas, G. H. Makins, F. S. Eve and J. H. Targett. Ophthalmic Surgeon: Dr. W. A. Bralley. Dental Surgeon: Mr. R. Denison Pedley. Senior Resident Medical Officer: Mr. T. G. Stevens. Junior Resident Medical Officer and Registrar: Mr. Hugh Ralph. Hon. Secretary: Dr. L. Dobree Chepmell.

**VICTORIA HOSPITAL FOR CHILDREN,** Chelsea, S.W. (with which is incorporated ST. GABRIEL'S HOSPITAL FOR INFANTS).—The hospital contains 90 beds and has a large out-patient department (nearly 1000 weekly); the home at Broadstairs has 50 beds, and the home at Churchfields 16 beds. Consulting Physician: Dr. W. H. Walsha. Consulting Surgeons: Mr. Erichsen and Mr. Cowell. Physicians: Dr. Ridge Jones and Dr. Dawtrey Drewitt. Physicians to the out-patients: Drs. Montague Murray, Walter Carr, W. Wallis Ord and Humphry D. Rolleston. Surgeons: Messrs. Pick and Clutton. Surgeons to the Out-patients: Messrs. D'Arcy Power and Raymond Johnson. Ophthalmic Surgeon: Mr. W. J. Holmes Spicer. Dental Surgeon: Mr. Percy Smith. Anæsthetist: Paul Frank Moline. M.D. House Surgeon: Mr. H. G. G. Cook. House Physician: Dr. R. C. M. Colvin-Smith. Secretary: Captain W. C. Blount, R.N. Out-patients are seen daily as under:—Medical and surgical cases: Daily, at 12.30, and every afternoon at 1.30. Dental cases: Saturdays, at 9 A.M.

**WEST LONDON HOSPITAL,** Hammersmith-road, W.—This hospital has 101 beds. About 1400 in-patients and 20,000 out-patients, whose attendances number 60,000, are treated annually. There are appointments for two House Physicians and two House Surgeons, with board and residence tenable for six months. Also appointments for a limited number of Clinical Assistants. Physicians: Drs. D. W. C. Hood, F. G. D. Drewitt and W. P. Herringham. Physician for Diseases of Women: Dr. Albert Venn. Surgeons: Messrs. C. B. Keetley, F. Swinford Edwards and W. Bruce Clarke. Surgeon for Diseases of the Eye: Mr. B. J. Vernon. Assistant Physicians: Dr. J. B. Ball, Seymour Taylor and A. E. Garrod. Assistant Physician for Diseases of Women: Dr. J. A. Mansell-Moullin. Assistant Surgeons: Messrs. S. Paget, L. A. Bidwell and G. L. Cheate. Assistant Surgeon for Diseases of the Eye: Mr. H. P. Dunn. Surgeon-Dentist: Mr. H. Lloyd Williams. Pathologist: Mr. H. P. Dunn. Physician-in-Charge of Throat and Nose Department: Dr. J. B. Ball. Surgeon-in-Charge of Aural Department: Mr. S. Paget. Surgeon-in-Charge of Skin Department: Mr. L. A. Bidwell. Surgeon-in-Charge of Orthopedic Department: Mr. C. B. Keetley. Electrician: Dr. F. O. Buckland. Administrators of Anæsthetics: Messrs. T. Gunton Alderton and Rickard W. Lloyd. Secretary: Mr. R. J. Gilbert.

**NORTH-EASTERN HOSPITAL FOR CHILDREN,** Hackney-road, N.E. City Offices: 27, Clement's-lane, E.C.—This hospital contains 57 beds. Last year 508 in-patients and 13,722 out-patients (representing 48,909 attendances) were relieved. Consulting Physicians: Drs. A. E. Sanson and W. Cayley. Consulting Surgeons: Messrs. Jonathan Hutchinson, R. J. Godlee and Waren Tay. Physicians: Drs. F. C. Turner, C. E. Armand Semple and W. Pasteur. Surgeons: Messrs. Bilton Pollard and H. Percy Dean. House Surgeons: (Senior) Mr. S. H. Bates, (Junior) Mr. H. G. Adamson. Lady Superintendent: Miss E. M. Curro. Secretary: Mr. Alfred Nixon. The surgeons attend on Wednesday and Friday at 9 A.M.; the physicians daily at 1.30 P.M.

**NORTH-WEST LONDON HOSPITAL,** Kentish Town-road.—This hospital provides 47 beds and has a large out-patient department. There are appointments for Two Resident Medical Officers, with board, residence and washing. The Senior Medical Officer also receives £50 per annum. Honorary Medical Staff:—Physician: Donald W. C. Hood, M.D. Surgeon: Frederic Durham, M.B. Lond., F.R.C.S. Assistant Physicians: Harry Campbell, M.D., B.Sc. Lond., M.R.C.P.; Walter K. Sibley, B.A., M.B., B.C. Cantab., M.R.C.S.; Leonard G. Guthrie, M.A., M.B., B.Ch. Oxon., M.R.C.P., M.R.C.S. Assistant Surgeons: M. P. Mayo Collier, M.S., M.B. Lond., F.R.C.S.; James Black, B.A., M.B. Cantab., F.R.C.S.; C. Gordon Brodie, F.R.C.S. Accessory Staff: J. Herbert Stowers, M.D.; John Shaw, M.D. Lond.; Wm. J. Collins, M.D., M.S., B.Sc. Lond., F.R.C.S.; C. F. Rivot, L.R.C.P., M.R.C.S., L.D.S. Resident Medical Officer: Dr. C. D. Sutherland. Assistant Medical Officer: Dr. C. N. Hamper. Secretary: Mr. Alfred Craske.

**GENERAL AND QUEEN'S HOSPITALS, BIRMINGHAM.**—*General Hospital:* Consulting Physicians: Dr. Fletcher, Sir W. Foster and Dr. Wade. Consulting Surgeons: Mr. Crompton, Mr. Baker and Mr. Pemberton. Physicians: Drs. Rickards, Saundby, Simon and Wilson. Surgeons: Messrs. Jolly, Chavasse, Barling and Haslam. Obstetric Officer: Dr. Malins. Assistant Physicians: Drs. Short and Russell. Assistant Surgeons: Messrs. Heaton and Jordan. *Queen's Hospital:* Consulting Physician: Sir James Sawyer. Consulting Obstetric Surgeon: Mr. John Clay. Consulting Surgeon: Mr. Furneaux Jordan. Physicians: Drs. Carter, Suckling and Foxwell. Surgeons: Messrs. Wilders, Bennett May, Jordan Lloyd and Marsh. Ophthalmic Surgeon: Mr. Priestley Smith. Obstetric Surgeon: Dr. Purslow. Dental Surgeon: Mr. Charles Sims. Physician for Out-patients and Pathologist: Dr. Kauffmann. Casualty Surgeons: Messrs. Morrison and Clayton.

**BRISTOL SCHOOL OF MEDICINE** (affiliated to University College, Bristol).—Students can complete in Bristol the entire course of study required for the Medical and Surgical degrees of the University of London, and for the diplomas of the Royal College of Physicians of London and the Royal College of Surgeons of England, the Apothecaries' Society of London, and the Army and Navy Boards. The lectures and instructions given at University College, Bristol, are adapted to the various Preliminary Arts Examinations above referred to, and also to the Matriculation and Preliminary Scientific Examinations of the University of London; while the Medical School, the Royal Infirmary and the General Hospital together provide for every detail of the professional curriculum required by the University of London and the above examining boards. All necessary information may be obtained from the Dean of the Bristol Medical School, Dr. Markham Skerritt.

**BRISTOL ROYAL INFIRMARY** (founded 1735).—264 beds. Physicians: Drs. Shingleton Smith, Waldo, Shaw, and Prowse. Surgeons: Messrs. Prichard, Greig Smith, Harsant, and Bush. Ophthalmic Surgeon: Mr. Cross. Obstetric Physician: Dr. Walter Swayne. Dental Surgeon: Mr. Ackland. Assistant Physician: Dr. Watson Williams. Assistant Surgeons: Mr. Munro Smith and Dr. James Swain. Hon. Pathologist: Dr. Edgeworth. House Surgeon: Mr. W. J. Hill. House Physician: Mr. Ormerod. Secretary and House Governor: Dr. Skelton, D.S.G.

*Scholarships and Prizes.*—Two Entrance Scholarships, 35 guineas and 10 guineas, awarded annually in October, after examination in general subjects; Surgical and Medical Suple Gold Medals, 5 guineas each, with 7 guineas added in money; Clark Prize, 15 guineas; Crosby Leonard Prize, 7 guineas; Tibbitts Prize, 9 guineas; Midwifery Prize, 3 guineas in books; Six Pathological Prizes, 3 guineas each.

Dressers reside in the house in weekly rotation, and have charge of all casualties under the supervision of the house surgeon. Special instruction (including dresserships) for first-year students in the out-patient department. Class instruction in the wards by the physicians and surgeons on five days a week, in addition to the regular clinical lectures. Clinical Clerkships and Dresserships, 5 guineas for each six months. Perpetual Medical and Surgical Practice, 35 guineas in one sum. Special departments for Diseases of Women, the Eye, Ear, Throat, &c., with Clerkships and Dresserships attached. One or two Pathological Clerks are appointed every four months, who perform all post-mortem examinations. There is a large museum and well-stocked library.

Further information can be obtained from Dr. Arthur B. Prowse, Dean of the Faculty.

**BRISTOL GENERAL HOSPITAL.**—200 beds. Physicians: Drs. Markham Skerritt, Harrison, and Baron. Physician-Accoucheur: Dr. Lawrence. Surgeons: Messrs. Lansdown, Dobson, Pickering, and Penny. Ophthalmic Surgeon: Mr. Walker. Assistant Physician: Dr. Clarke. Assistant Surgeon: Mr. Barelay. Assistant Obstetric Physician: Dr. Newnham. Registrar: Mr. Morton. Anaesthetist: Mr. R. G. L. Lansdown. Dental Surgeon: Mr. Genge. House Surgeon: Dr. Solly. Physician's Assistant: Mr. Carter. Assistant House Surgeon: Mr. Star. Clinical Clerkship, six months, £5 5s. Dressership, six months, £5 5s. Obstetric Clerkship, three months, £3 3s. Special clinical instruction is given in Diseases of the Skin, Eye, Ear, and Throat, also in Diseases of Women and in Dental Surgery. Further

information may be obtained of the Secretary, at the hospital, or from Dr. Markham Skerritt, Dean of the Hospital Faculty.

*Scholarships and Medals.*—*Lady Haberfield Entrance Scholarship:* This scholarship, founded in 1875, of the value of about £30 the interest of £1000 bequeathed for the purpose by the late Lady Haberfield, is awarded annually at the commencement of the winter session, after a competitive examination in subjects of general education. *Second Entrance Scholarship:* An additional Entrance Scholarship of the value of £20 is awarded when more than six candidates present themselves. *Clarke Scholarship:* A Surgical Scholarship, of the value of £15, founded by H. M. Clarke, Esq., of London, is awarded annually at the end of the winter session, after an examination in Surgery. *Sanders Scholarship:* A Scholarship founded by the late John Nash Sanders, Esq., of the value of £22 10s., is awarded annually at the end of the winter session, after examination in Medicine, Surgery, and Diseases of Women. *Martyn Memorial Pathological Scholarships,* founded in 1878, by public subscription, in memory of the late Dr. Samuel Martyn, Physician to the Hospital. Two Scholarships, each of the value of £10, are awarded annually; one at the end of the summer session, and one at the end of the winter session. A student may, at the option of the Faculty, hold both these Scholarships. After a competitive examination in Pathology and Morbid Anatomy, the successful candidate is appointed Pathological Clerk to the hospital for the term of six months. *Committee Gold Medal:* This medal, presented by the committee of the hospital, is awarded annually at the end of the winter session to the student of the fourth year who has most distinguished himself during his career at the hospital and medical school. *Committee Silver Medal:* This medal, presented by the committee of the hospital, is awarded annually at the end of the winter session to the next most distinguished student of the fourth year. The rules relating to the several Scholarships may be had on application.

**CAMBRIDGE: ADDENBROOKE'S HOSPITAL.**—Clinical Lectures in Medicine and Surgery, in connexion with the Cambridge Medical School, are delivered at this hospital twice a week during the academical year; and practical instruction in Medicine and Surgery in the wards and out-patients' rooms is given by the physicians and surgeons daily, during the vacations as well as term time. Instruction is also given in all the special modes of medical and surgical investigation. Clinical Clerks and Dressers are selected from students according to merit, and without payment. The composition fee for pupilship is 8 guineas.

**UNIVERSITY OF DURHAM COLLEGE OF MEDICINE,** Newcastle-upon-Tyne.—The following Scholarships and Prizes are awarded annually:—A University of Durham Scholarship, value £100, for proficiency in Arts, awarded to full students in their first year. The Dickinson Scholarship, value the interest of £400, and a Gold Medal, for Medicine, Surgery, Midwifery, and Pathology. The Tulloch Scholarship, value the interest of £400, for Anatomy, Physiology, and Chemistry. The Charlton Scholarship, value the interest of £700, for Medicine. The Gibb Scholarship, value the interest of £500, for Pathology. The Goyder Memorial Scholarship (at the Infirmary), value the interest of £325, for Clinical Medicine and Clinical Surgery. The Luke Armstrong Memorial Scholarship, value the interest of £680. The Stephen Scott Scholarship for promoting the study of Hernia and allied subjects, value the interest of £1000. At the end of each session a Prize of Books and Honours Certificates are awarded in each of the regular classes. Assistant Demonstrators of Anatomy, receiving each an honorarium of £5, an Assistant Curator of the Museum, Prosectors, and Assistant Physiologists are elected yearly. Pathological Assistants, Assistants to the Dental Surgeon, Assistants in the Eye Department, Clinical Clerks, and Dressers are appointed every three months.

**NEWCASTLE-UPON-TYNE ROYAL INFIRMARY.**—Physicians: Drs. Philipson, Drummond, Oliver, and Limont. Surgeons: Drs. Arnison, Hume and Page, and Mr. Williamson. Assistant Surgeon: Mr. T. A. Dodd and Mr. James Rutherford Morison. Pathologist: Dr. Drummond. Dental Surgeon: Mr. R. L. Markham. House Physician: Dr. W. D. Arnison. Chloroformist: Dr. W. Baigent. Surgical Registrar: Mr. Geo. Walter Ridley.

The infirmary contains 280 beds. Clinical Lectures are delivered by the Physicians and Surgeons in rotation. Pathological Demonstrations are given as opportunity offers by the Pathologist. Practical Midwifery can be studied at the Newcastle Lying-in Hospital. Instruction is given in Psychological Medicine at the Coxlodge Lunatic Asylum. A Special Course of Instruction is given in the City Hospital for Infectious Diseases by the Superintendent, the City Officer of Health, Mr. H. E. Armstrong.

**LEEDS GENERAL INFIRMARY AND MEDICAL DEPARTMENT OF THE YORKSHIRE COLLEGE.**—The Leeds General Infirmary has accommodation for 471 in-patients, surgical and medical, including forty-two beds at a "semi-convalescent home" in the country. During the last year 5425 in-patients and 38,988 out-patients were treated; these numbers show a remarkable increase if compared with statistics of eleven years ago, when only 11,500 out-patients were seen. Clinical teaching takes place daily in the wards, and Clinical Lectures are given in the operating-room. There are Medical, Surgical, Ophthalmic, Aural, and Electrical Departments, in each of which special instruction is imparted to students. A Gynaecological and Extern Obstetric Department, together with Laryngeal and Skin Clinics, are in operation. The Public Dispensary, the Hospital for Women and Children, the Fever Hospital, and the West Riding Lunatic Asylum are other medical institutions which are made use of by the Leeds students.

In consequence of the growing requirements for space, chiefly as regards lecture-rooms and laboratories, plans have been prepared and an admirable site secured for a new building. It is believed that this building, the erection of which is in progress, will, in its convenience, commodiousness, and completeness, compare favourably with any similar institution in the kingdom. Meanwhile the work of the Medical School is carried on mainly in the premises in Park-street, which, erected in 1865, were then considered to be of ample size for the needs of the school, and were furnished with all that was necessary to give a complete medical education. The dissecting-rooms and physiological laboratories (which have been considerably enlarged since they were first built), the library, and the museums of Pathology and *Materia Medica*, are contained in this building. By the kind permission of the board of the infirmary, the lectures on Medicine, Surgery, and Ophthalmology are given in that institution; while the classes in Chemistry and Physics, Biology and Botany, Practical Chemistry, Practical Toxicology, and Practical Pharmacy, are held in College-road, in the Arts and Science Department of the College buildings. Two entrance Scholarships are offered: one, of the value of 60 guineas, covering admission to all requisite lectures; and the other, of the value of 40 guineas, covering the cost of admission to the medical and surgical practice of the infirmary. Several valuable prizes are given at the end of each session. The following appointments at the infirmary are annually open to students: Resident medical officer, resident surgical officer, resident obstetric officer, appointed for twelve months, and eligible for re-election; two house physicians, holding office for twelve months; four house surgeons, for twelve months; twenty-four physicians' clerks, for three months; twenty-four surgeons' dressers, for six months; sixteen ophthalmic and aural surgeons' dressers, for three months; eight gynaecological ward clerks, for three months; eight gynaecological out-patient clerks, for three months; twenty-four assistant physicians' clerks, for three months; twenty-four assistant surgeons' dressers, for three months; forty-eight dressers in the casualty-room, for three months; twelve post-mortem clerks, for three months.

There are appointments open to students in other medical institutions in the town, and also in the West Riding Lunatic Asylum.

**UNIVERSITY COLLEGE, LIVERPOOL, MEDICAL FACULTY: VICTORIA UNIVERSITY.**—The infirmary attached to the School contains 300 beds, with 40 special beds for the treatment of Diseases of Women. Lock, Lying-in, and Eye and Ear Hospitals are in the immediate vicinity, and their practice is open to the students of the Medical Faculty.

The composition fee for lectures and classes is £24 15s. for Preliminary Scientific Classes, and 60 guineas for the Medical Classes required for Victoria and London degrees; 60 guineas for the classes for the London diploma, ex-

clusive of Biology. The composition fees are payable in two instalments, with an interval of twelve months. The fee for hospital practice is 40 guineas, exclusive of the special hospital practice in Fever, Eye and Mental Diseases, which may be paid in the same way.

Three house physicians and three house surgeons are appointed from the qualified pupils every six months, also clinical clerks, dressers, and post-mortem clerks.

Two Holt Tutorial Scholarships, each of the value of £100, are awarded annually by the Medical Faculty to senior students. Also an entrance Lyon Jones Scholarship of £21 for two years for students proceeding to the Victoria degree, and another of the same value open to all students who have completed their second year. The Derby Exhibition of £15 for Clinical Medicine and Surgery. The Torr and School Gold Medals for Anatomy and Physiology, and the class prizes.

**MEDICAL DEPARTMENT OF OWENS COLLEGE, VICTORIA UNIVERSITY.**—This medical school is located in a large new building, which forms a part of Owens College. It is provided with a very large dissecting-room, physiological laboratory, private laboratories, and work-rooms, besides lecture-rooms, a museum, and a library. In order to give the fullest possible opportunities for teaching and investigation in the departments of Anatomy, Physiology, Pathology, and *Materia Medica*, an extension of the school buildings has been made and further extensions are approaching completion. The more strictly practical departments of medical study are taught partly in the Medical School and partly in the Royal Infirmary, to which are attached a fever hospital, a lunatic asylum, and a convalescent home. Medical and Surgical Clinical Classes are conducted in the infirmary, and separate instruction is afforded in the elements of Medical and Surgical Physical Diagnosis, in Obstetric Medicine, Ophthalmic Surgery, and Pathological Anatomy by the different members of the staff of the Medical School and Infirmary. The following scholarships and prizes are open to students of the Medical School:—A Dauntsey Scholarship of the value of about £100 is offered annually for competition at the beginning of October to persons who have not been students in any medical school in the United Kingdom, and whose age does not then exceed twenty-five years. The subjects for examination are—(a) General and Comparative Anatomy; (b) Physiological Botany; (c) Chemistry; (d) Mathematics or Latin. Medals are awarded on the results of the various class examinations at the end of each session. A Platt Physiological Scholarship of £50 a year for two years is offered annually to the student who, having studied for one entire session in the Physiological Laboratory of Owens College, has prosecuted the best original investigation in Physiology, and has passed a satisfactory examination in Physiology. Two Platt Exhibitions, of the value of £15 each, to be competed for by first and second year students in the class of Physiology. A Dumville Surgical Prize of £20 is offered annually for proficiency in Clinical Surgery. The Turner Medical Prize of £25 is awarded annually. The John Henry Agnew Scholarship in Diseases of Children is also offered for competition each year. Medical and Surgical Clinical Prizes, each of the value of 6 guineas, are open to competition each year for the best reports (with comments) of cases which have occurred in the wards of the infirmary.

**MANCHESTER ROYAL INFIRMARY (300 beds).**—Consulting Physicians: Drs. Frank Renaud, H. Browne, Sir Wm. Roberts, Henry Simpson, and John E. Morgan. Consulting Surgeons: Messrs. George Bowring, E. Lund, and F. A. Heath. Physicians: Drs. D. J. Leech, J. Dreschfeld, Thos. Harris and Graham Steell. Assistant Physicians: Drs. J. S. Bury and A. T. Wilkinson. Obstetric Physician: Dr. Lloyd Roberts. Surgeons: Messrs. Walter Whitehead, Thomas Jones, Jas. Hardie, and F. A. Southam. Assistant Surgeons: Messrs. G. A. Wright and Wm. Thorburn. Ophthalmic Surgeon: Dr. D. Little. Dental Surgeon: Mr. G. W. Smith. Medical Registrar: Dr. R. T. Williamson. Administrators of Anæsthetics: Mr. Alexander Wilson and Mr. A. G. Andrews. General Superintendent and Secretary: Mr. W. L. Saunder.

**BARNES CONVALESCENT HOSPITAL, Cheshire (in connexion with the Manchester Royal Infirmary; 136 beds).**—Secretary: Mr. W. L. Saunder. Resident Medical Officer: Dr. John E. Platt.

**MONSALL FEVER HOSPITAL, Newton Heath (in connexion with the Manchester Royal Infirmary; 350 beds).**—Resident

Medical Officer: Dr. Alex. Johnston. Secretary: Mr. W. L. Saunder.

**RADCLIFFE INFIRMARY, OXFORD.**—This infirmary is open to students for Medical and Surgical work in the wards and out-patients' departments. Clinical lectures are given by the Lichfield Clinical Lecturers in Medicine and Surgery. Also tutorial instruction and demonstrations are given in special Regional Anatomy (medical and surgical), methods of Medical Diagnosis, and Surgical Manipulation. Practical Pharmacy is taught in the Infirmary Dispensary. The whole course of study at the museum and infirmary combined is intended for students until they have passed the Second Conjoint Examination or the First Oxford M.B.

**SHEFFIELD SCHOOL OF MEDICINE**—The medical school is provided with dissecting-room, physiological laboratory, museum, library, and class-room. The course of lectures and instruction are adapted to meet the requirements of the various examining bodies. Chemistry, Physics, Comparative Anatomy, Elementary Biology, Botany, and Toxicology are taken out at Firth College. The infirmary contains 200 beds, a museum of Pathology, library, and post-mortem theatre, with microscopes, and all the appliances for clinical research. The Public Hospital and Dispensary contains 101 beds, and is recognised by the examining bodies. Perpetual fee for hospital practice £45 in one payment, or by two instalments; £26 on entering for hospital practice, and 22 guineas within twelve months afterwards. A tutor's fee of £2 2s is required from students entering for Anatomy and Physiology.

**JESSOP HOSPITAL FOR WOMEN, Gell-street, Sheffield.**—The hospital is devoted to Diseases peculiar to Women. There is also an Obstetric Department for the admission of a small number of cases. A staff of midwives connected with the hospital attend lying-in women at their own homes, and in case of need are assisted by the members of the medical staff. Out-patients are attended daily. Students can attend the practice of the hospital, and be supplied with cases of midwifery. Communications should be addressed to the Secretary, York Chambers, York-street, Sheffield.

#### ENGLISH PROVINCIAL HOSPITALS HAVING SPECIAL CLASSES AND FACILITIES FOR CLINICAL STUDY.

**BATH ROYAL UNITED HOSPITAL (120 beds).**—Honorary Consulting Physician: Dr. Cones. Honorary Consulting Surgeon: Mr. Fowler. Honorary Physicians: Drs. Cole and Fox. Honorary Surgeons: Messrs. Stockwell, Freeman and Scott. Honorary Assistant Medical Officers for Out-patients: Mr. Lane, Drs. Wilson-Smith and Bannatyne. Honorary Assistant Surgeons: Messrs. Green, Ransford and Terry. Dental Surgeon: Mr. Gaine. Curator of Museum: Dr. Bannatyne. Anaesthetist: Mr. Lace. Registrar: Mr. Hopkins. The hospital is recognised by the Royal College of Physicians, Surgeons, &c., and licensed for dissections. It contains a library and an excellent museum, in which are a large number of interesting specimens, both in Pathology and Comparative Anatomy. Fees for attendance: twelve months, £10 10s.; six months, £5 5s. (Temporary pupils can also, by permission of the Honorary Staff, attend the practice of the hospital by the payment of £1 1s. for each month.) Instruction in Practical Pharmacy for three months, £3 3s. Number of Patients admitted during 1891, 1048. Out-patients, 8448. Operations performed, 305. Cases of anaesthetisation recorded, 305. Out-patient casualties, 1203. For further particulars apply to the Registrar.

**DEVON AND EXETER HOSPITAL, Exeter.**—Medical and Surgical Staff: Consulting Physician: Dr. Drake. Physicians: Drs. H. Davy, Arthur G. Blomfield, and Wm. Gordon. Consulting Surgeons: Messrs. A. J. Cumming and T. W. Caird. Surgeons: Messrs. James Bankart, J. D. Harris, E. J. Donville, and Charles E. Bell. House Surgeon: Mr. Henry Andrew. Assistant House Surgeon: Mr. G. Stewart Abram. The hospital contains 218 beds (including special children's wards). There is a good library, museum, dissecting and post-mortem rooms. Attendance on the practice of this hospital qualifies for all the examining boards. Arrangements can be made by which students can attend Midwifery. There is also a Nurses' Home attached to the Hospital. For further particulars as to fees &c., apply to the House Surgeon.

**WEST OF ENGLAND EYE INFIRMARY, Exeter.**—Surgical Staff: Messrs. Bankart and Toswill. Registrar: Mr. Roper. Secretary: Mr. R. C. Cole. The infirmary contains fifty beds. Students of the Exeter Hospital can attend the practice of the Eye Infirmary. Patients for the year ending Michaelmas, 1891, 2104. Total number of patients since the opening of the Infirmary in 1808, 79,512. Days of admission: Mondays, Tuesdays, and Fridays, at 11.

**GENERAL KENT AND CANTERBURY HOSPITAL.**—Opened for the reception of patients April 26th, 1793. 53,331 in-patients and 95,953 out-patients have been admitted since the hospital was open. The hospital contains 106 beds. Pupils of the staff are admitted to the practice of the hospital, and have the use of the library of the East Kent and Canterbury Medical Society for £7 7s. Operation day, Thursday, 11 A.M. Physician: Dr. Henry Alex. Gogarty. Consulting Surgeon; Mr. James Reid. Surgeons: Messrs. Charles Holttum, Frank Wacher, T. Whitehead Read, and John Greasley. Dentist: Mr. Martin L. Bell. House Surgeon: Mr. Z. Prentice. Assistant House Surgeon and Dispenser: Mr. A. C. Elliman. Secretary: Mr. Arthur J. Lancaster. Over 600 in-patients, 3000 out-patients, and 1000 dental cases are attended in a year.

**LIVERPOOL NORTHERN HOSPITAL (160 beds).**—There is a special ward for the treatment of Children. Clinical lectures are delivered by the physicians and surgeons during the summer and winter sessions. Clinical clerkships and dresserships are open to all students without additional fee. Consulting Surgeons: Mr. W. H. Manifold and Dr. W. Macfie Campbell. Physicians: Dr. E. H. Dickinson, M.A.; Dr. James Barr. Surgeons: Messrs. Chauncy Puzey, Damer Harrison, and A. H. Wilson. Fees for hospital attendance: Perpetual, £26 5s.; one year, £10 10s.; six months, £7 7s.; three months, £4 4s.; Practical Pharmacy, £2 2s. Students can enter to the medical or the surgical practice separately on payment of half the above fees.

**LIVERPOOL ROYAL SOUTHERN HOSPITAL (CLINICAL SCHOOL).**—Physicians: Dr. Cameron, Dr. Carter and Dr. Williams. Surgeons: Mr. Rawdon, Mr. Alexander and Mr. Robert Jones. Medical Tutor: Dr. Macalister. Surgical Tutor: Mr. Davey. Pathologist: Dr. Barendt. The hospital is situated within convenient distance of the School of Medicine and contains 164 beds. There is a children's ward and beds are appropriated to the diseases of women. Clinical teaching is given in the hospital and arrangements have been made to render it both thorough and systematic. The members of the staff visit the wards daily and clinical lectures are given every week. Tutorial classes are also held each day at which the junior students are instructed in the methods of diagnosis and the seniors are prepared for their final examinations. The pathological department has a good laboratory attached in which the students receive practical instruction. In addition to the usual clinical and post-mortem clerkships, which are open to all students, the resident post of Ambulance Officer is awarded every three months to the student whom the board may consider most suited to hold it. A Scholarship of £20 is competed for annually, which has attached to it some clinical and pathological duties; and three prizes of £5 each are yearly offered for the best series of clinical reports. Fees: Perpetual £26 5s.; one year £10 10s.; six months £7 7s.; three months £4 4s. A limited number of resident pupils can be received. Terms (exclusive of fees for Hospital Practice), £15 15s. per quarter. The practice of the hospital is recognised by all examining bodies. Special wards for accidents and diseases of children. Resident students received. For further particulars apply to the Dean, Mr. Robert Jones, 11, Nelson-street, Liverpool.

**NEW ROYAL INFIRMARY, Liverpool.**—The buildings of the new Royal Infirmary were completed and occupied in 1890. They stand on the old site, adjacent to the college, but enlarged by the purchase of a fine frontage in Pembroke-place and of the street known as Pembroke-gardens. Externally, they form a handsome and imposing group of buildings, the general arrangement of which may be gathered from the plan at the beginning of the prospectus. Every available open-air space has been taken advantage of to secure good airing grounds for the patients, and the beauty of the buildings has been not a little enhanced by the numerous balconies, colonnades, and flat roofs adapted to the same purpose for both patients and resident staff. Internally, no point in modern sanitary science has been omitted. The wards—some parallelograms, some circular—

have floors of waxed oak blocks, laid on an iron and cement substratum. Three operating theatres and a clinical lecture theatre have been provided. There is an electrical room, and provision for special kinds of baths. The out-patient department has been so modelled that advantage can be taken of the patients who come to it for the study of minor medical and surgical maladies, and probably also of certain special forms of disease. A room has been allotted to the tutors, in which they may keep their records, while each surgeon and physician has a private room in connexion with his wards, where his dressers and clerks may write up and tabulate cases and investigate morbid products. The pathological department, which is daily becoming of more importance in medical education, has had much pains expended upon it, so as to give proper facilities for the study of morbid anatomy. It is hoped that the facilities for clinical work will be such as not merely to enable the present students to learn the practical parts of their profession thoroughly, but to attract students from overcrowded institutions where the number of pupils is far in excess of the opportunities for the bedside study of disease. In no hospital in the country are the resident physicians and surgeons so comfortably lodged. Each is provided with a bedroom and a private sitting-room in addition to the music-room and dining-room, where all the six residents meet in common.

**NORFOLK AND NORWICH HOSPITAL** (220 beds).—Fees: £10 10s. for six months', £15 15s. for twelve months' medical and surgical practice. Pupils: resident and non-resident. Consulting Physician: Sir P. Eade, M.D. Consulting Surgeons: Mr. T. W. Crosse, F.R.C.S., and Mr. W. Cadge, F.R.C.S. Physicians: Sir Frederic Bateman, M.D., Dr. Barton and Dr. Burton-Fanning. Surgeons: Mr. Williams, Dr. Beverley and Mr. H. S. Robinson. Assistant Surgeons: Mr. S. H. Burton and Mr. D. D. Day. Dental Surgeon: Mr. R. Wentworth White. House Surgeon: Mr. Reginald Crosse. Secretary: Mr. Poole Gabbott.

**NORTHAMPTON GENERAL INFIRMARY** (Established 1743; rebuilt 1793).—In-patients, 1870; out-patients, 9202. The number of beds is 160. Out-pupils are received, and have every opportunity of acquiring a practical knowledge of their profession. Instruction is also given in Anatomy and Materia Medica and Practical Pharmacy. Pupils' fee £25 per annum, or a perpetual fee of £50. Non-resident pupils are taken at a fee of £10 10s.

**NORTH STAFFORDSHIRE INFIRMARY AND EYE HOSPITAL**, Hartshill.—The New Infirmary, opened in 1869, is built on the pavilion plan, has accommodation for over 220 patients, including Children's wards, special Ovarian wards, and a special department for the treatment of Diseases of the Eye. In-patients last year, 1877; out-patients, 9661. The attendance of pupils at this infirmary is duly recognised by all the examining boards; and there are unusual facilities for acquiring a practical knowledge of the profession. Physicians: Dr. A. M. McAldowie and Dr. J. Charlesworth. Surgeons: Messrs. J. Alcock and W. D. Spanton. Ophthalmic Surgeon: Mr. J. G. U. West. Assistant Ophthalmic Surgeon: Mr. Herbert Folker. Assistant Physicians: Messrs. S. King Alcock and H. Nicholls. Assistant Surgeons: Drs. G. S. Hutton and W. Hind. Dental Surgeon: Mr. A. Baines. House Surgeon: Mr. A. S. Barling. House Physician: Mr. T. Treffy Cockill. Secretary: Mr. R. Hordley, Hartshill, Stoke-on-Trent, from whom particulars as to fees &c. may be obtained.

**WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL** (founded 1848; beds, 230).—A preparatory school of Medicine and Surgery. The pupils have the advantage of seeing the whole of the practice of the physicians and surgeons, and are trained in clinical work by the medical and surgical staff. The attendance of pupils at this hospital is recognised by all the examining boards. Operations are performed every Thursday at 11 o'clock, and practitioners are welcomed.

**SUSSEX COUNTY HOSPITAL**.—Beds, 174. In-patients treated annually, 1520; out-patients treated annually, 7800. This hospital affords ample facilities for students, possessing a large out-patient department, a library and a well-appointed museum. The hospital does not take resident pupils, but out-pupils may attend the practice of the hospital for any period not exceeding two years on payment, in advance of such a fee, not exceeding 20 guineas, as the Committee of Management shall direct.

**MANCHESTER GENERAL HOSPITAL FOR SICK CHILDREN**, Pendlebury and Gartside-street.—The hospital contains 140

beds, including 28 for scarlet fever. The medical staff visit the hospital daily at 10 A.M. Clinical instruction is given by the medical staff at the Hospital and Dispensary. Out-patients are seen daily at 9 A.M. at the Dispensary, Gartside-street, Manchester. Physicians: Drs. Ashby and Hutton. Surgeon: Mr. G. A. Wright. Assistant Surgeon: Mr. Joseph Collier. During 1891 there were 1249 in-patients and 10,571 out-patients under treatment at the Dispensary.

**BRADFORD EYE AND EAR HOSPITAL**.—The hospital contains 45 beds. The staff attend from 3 to 5 on Tuesdays and Saturdays for Diseases of the Eye, and on Thursdays for Diseases of the Ear. Operations on Tuesday and Thursday at 5 P.M. During 1891 the number of out-patients was 4113, and 489 major operations were performed. The clinique of the hospital is open to medical practitioners and advanced students. Surgeons: Drs. Bell and Adolph Bronner. Assistant Surgeons: Drs. Johnstone, Dodd, and Little.

**ROYAL PORTSMOUTH HOSPITAL**. (Opened 1849).—Beds, 133. In-patients last year, 896; out-patients, 6803. One year's attendance recognised by the Examining Boards. Consulting Surgeon: Mr. E. K. Knight. Physicians: Drs. E. J. Wallace and J. Watson. Surgeon: Dr. J. Ward Cousins, F.R.C.S. Dental Surgeon: Mr. Kirton. Surgeon for Out-patients: Mr. C. H. Newby, F.R.C.S. House Surgeon: Mr. T. H. Bishop, M.B. Assistant House Surgeon: Mr. B. B. Thorne. For particulars as to fees &c. apply to the House Surgeon.

## SCOTLAND.

### MEDICAL SCHOOLS WITH FULL CURRICULUM.

**SCHOOL OF MEDICINE, Edinburgh**.—The students who enter the classes of the school of medicine are partly University students, proceeding to the University qualification; and partly students who are intending to take other qualifications, such as the qualifications of the Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, and the Faculty of Physicians and Surgeons of Glasgow, the Royal College of Surgeons of England, and the University of London, and elsewhere. The number of students varies much in the classes and subjects. In Practical Anatomy alone it reaches 600 different students. It is much within the limit to say that about 1000 students avail themselves each year of the opportunity of attending the school. The number of class tickets issued annually by the lecturers is of course considerably larger. The lectures qualify for the University of Edinburgh and the other Universities, the Royal Colleges of Physicians and Surgeons of Edinburgh, London, and Dublin, the Faculty of Physicians and Surgeons of Glasgow, and the other Medical and Public Boards. In accordance with the recent Statutes of the University of Edinburgh, one half of the qualifying classes required for graduation may be attended in this school. The regulations require that the fee for any class, taken for graduation in Edinburgh, shall be the same as that for the corresponding class in the University. The whole education required for graduation at the University of London may be taken in this school.

*Fees*.—For a first course of lectures, £3 5s.; for a second, £2 4s.; perpetual, £5 5s. To those who have already attended a first course in Edinburgh the perpetual fee is £2 4s. Practical Anatomy (six months' course), £3 3s.; course of demonstrations, £2 2s.; perpetual, £4 4s. Practical Anatomy, with course of demonstrations, £4 4s. Practical Chemistry, £3 3s. Analytical Chemistry, £2 for one month, £5 for three months, or £10 for six months. Practical Physiology, Practical Pathology, and Practical Materia Medica and Pharmacy, each £3 3s.; Diseases of the Ear and Throat, and Diseases of the Eye, each £2 2s. For summer courses of Clinical Surgery and Clinical Medicine, each £2 4s.; Practical Anatomy, including Anatomical Demonstrations, £2 2s.; Operative Surgery, £3 3s.; Insanity, £1 1s.

**EDINBURGH SCHOOL OF MEDICINE AND PHARMACY**, Marshall-street, Nicolson-square.—The classes of this School will be resumed for the winter session on October 11th next, Chemistry, Theoretical and Practical, Midwifery, Surgery, and Medicine. From the Dispensary attached to this institution, Pharmacy, Practical and Theoretical. Practical Midwifery. Out-door Practice. Medical and Surgical Diagnosis. Attendance at this institution qualifies for the University of Edinburgh and all other licensing boards. Tutorial classes

in all the branches of the medical curriculum. Particulars of R. Urquhart, Secretary.

**ANDERSON'S COLLEGE MEDICAL SCHOOL, Glasgow.**—This medical school dates back to the year 1790. It has given fourteen professors to the University of Glasgow, of whom six at present hold office. The following courses are given, which qualify for all the licensing boards and for the Universities of London, Durham, Ireland, Edinburgh, and Glasgow (the latter two under certain conditions):—In winter: Anatomy, Professor A. M. Buchanan, M.A., M.D.; Chemistry, Professor J. Robertson Watson, M.A.; Physics, Professor Freeland Fergus, M.D.; Zoology, Professor Geo. Bell Todd, M.B.; Physiology, Professor D. Campbell Black, M.D.; Surgery, Professor James Dunlop, M.D.; Practice of Medicine, Professor Samson Gemmell, M.D.; Materia Medica, Professor Alex. Napier, M.D.; Diseases of Women, Professor W. L. Reid, M.D.; Ophthalmic Medicine and Surgery, T. Spence Meighan, M.D.; Aural Surgery, Thomas Barr, M.D.; Diseases of Throat and Nose, John Macintyre, M.B. In summer: Anatomy, Practical Anatomy, and Osteology, Practical Chemistry, Physics, Practical Pharmacy, Practical Physiology, Operative Surgery, Midwifery and Diseases of Children, Medical Jurisprudence, Professor T. Kennedy Dalziel, M.B.; Botany, Professor King; Ophthalmic Medicine and Surgery and Mental Diseases, Dr. Carswell; Diseases of Throat and Nose and Hygiene and Public Health, P. Caldwell Smith, M.A., M.D., D.P.H.Camb. The Chemical Laboratory is open daily from 10 to 5. The Dissecting-room is open in winter from 9 A.M. to 6 P.M., and in summer from 6 A.M. to 6 P.M. The students are assisted in their dissections by the Professor and Demonstrators, by whom frequent examinations and demonstrations on the parts dissected are conducted. The supply of subjects for dissection is ample, and students are consequently provided with parts as soon as they may be ready for them. The Dissecting-room is provided with a complete series of dissected specimens, mounted in plaster-of-Paris, illustrating the anatomy of the human body.

The new buildings are situated in Dumbarton-road, immediately to the west of the entrance to the Western Infirmary, within two minutes' walk of it, and four minutes' walk of the University. Extensive accommodation is provided for Practical Anatomy, Practical Chemistry, Practical Physiology, Practical Pharmacy, and Operative Surgery. There are also provided a large library and reading-room, and a students' recreation-room.

**Fees.**—For each of the above courses of Lectures (Anatomy and Chemistry excepted), first session, £2 2s.; second session, £1 1s. Anatomy Class Fees: Winter, first session (including Practical Anatomy), £4 4s.; second session (including Practical Anatomy), £4 4s.; third session, £2 2s. To those who have had the necessary courses of Practical Anatomy the fee will be £1 1s. Summer, Lectures and Practical Anatomy, £2 2s.; Lectures alone, £1 11s. 6d.; Practical Anatomy alone, £1 1s.; Osteology and Practical Anatomy, £2 2s.; Osteology alone, £1 11s. 6d. Chemistry Fees: First course, £2 2s.; second course, £2 2s. Matriculation Fees: 10s. to those taking out two or more classes; 5s. to those taking out only one class. The fee of 10s. represents a combined fee for the winter and summer sessions. Students who have attended Classes at other Schools, and who desire to pursue their studies at Anderson's College Medical School, will be admitted to such Classes as they may have attended elsewhere at the reduced fees.

**Royal Infirmary.**—Fees: Hospital Practice and Clinical Instruction, first year, £10 10s.; second year, £10 10s.; afterwards free. Six months, £6 6s.; three months, £4 4s. Pathology, both courses, £3 3s. Vaccination Fee, £1 1s.

**Western Infirmary.**—Fees: Hospital Practice and Clinical Instruction, first year, £10 10s.; second year, £10 10s.; afterwards free. Six months, £7 7s.; three months, £4 4s. Pathology, both courses, £4 4s. Vaccination Fee, £1 1s.

Certificates of attendance on the lectures at Anderson's College Medical School are received by the Universities of London, Durham, Ireland, Edinburgh, and Glasgow (the latter two under certain conditions); by the Royal Colleges of Physicians of London and Edinburgh; by the Royal Colleges of Surgeons, England, Edinburgh, and Ireland; by the King and Queen's College of Physicians, Ireland; by the Faculty of Physicians and Surgeons of Glasgow; by

the Apothecaries' Hall, London; and by the Army, Navy, and East India Boards. Communications relating to the Medical School to be addressed to the Dean of the Medical Faculty, Professor Samson Gemmell, M.D., Anderson's College Medical School, Dumbarton-road, Partick, Glasgow. Communications relating to the Preliminary Examination in General Education, and also regarding the Triple Qualification, to be addressed to Alexander Duncan, Esq., B.A., Faculty Hall, 242, St. Vincent-street, Glasgow.

**ST. MUNGO'S COLLEGE AND GLASGOW ROYAL INFIRMARY.**—This College was incorporated in 1889. The Glasgow Royal Infirmary was founded in 1791. The Faculty of Medicine of the College occupies new buildings erected for the purposes of a medical school, adjoining and communicating with the Royal Infirmary. The Laboratories, Museums, and Lecture-rooms are equipped and adapted to modern scientific requirements. Recent additions consist of Public Health, Practical Zoology, and Bacteriological Laboratories. The Royal Infirmary, which is at the service of the College for the purpose of clinical and practical instruction, is one of the largest general and special hospitals in the kingdom. It has nearly 600 beds, and will almost immediately have considerably over 600. It has special wards for Diseases peculiar to Women, for Venereal Diseases, Erysipelas, Burns, and Diseases of the Throat and Nose. At the Dispensary special advice and treatment are given in Diseases of the Eye, Ear, Teeth, and Skin, Women, Throat and Nose, in addition to the large and varied number of ordinary medical and surgical cases—over 36,000 per annum—which in a great industrial centre daily require attention. Students of the College and Hospital get the benefit of dispensary experience free of charge. All appointments are open. There are five Physicians and six Surgeons' Assistants, who board in the hospital free of charge, and act in the capacity of House Physicians and House Surgeons. These appointments are made for six months, and are open to gentlemen who have a legal qualification in Medicine or Surgery, and preference is given to the students of this College and Hospital. Clerks and Dressers are appointed by the Physicians and Surgeons. From the large number of cases of acute disease and accidents of varied character received into this hospital, these appointments are very valuable. In the Pathological Department assistants are also appointed. The session will open with an address by Professor McVail on Wednesday, Oct. 16th, at the College buildings.

**Ophthalmic Department.**—The Ophthalmic Institution in West Regent-street having been amalgamated with the Royal Infirmary, the usefulness of this department is very much increased, and greater opportunities afforded to students for the practical study of Diseases of the Eye. Dr. Wolfe, the ophthalmic surgeon, attends the Royal Infirmary every Tuesday and Friday at 12 noon, and daily at the Institution in West Regent-street from 1 to 2 o'clock. Students can attend both without payment of any additional fee. Lectures are delivered twice a week during the winter and summer sessions. Fee for the course, £2 2s.

The fee for each class is £2 2s., except for Anatomy, which is £4 4s., and for Physics, which is £2 4s. 6d., and certain extra classes, for which the fee is £1 1s. The governors have arranged a sessional fee, payment of which entitles the student to attendance not only on the curriculum classes, but all the classes—nearly as many more as the curriculum classes,—and this sessional fee is only slightly greater than the sum total of the fees required for the curriculum classes. Students are strongly recommended to begin their course on the sessional fee plan. This fee, exclusive of hospital practice, is £17 19s. 6d. for the first year, £15 15s. for the second, £10 10s. for the third, and £5 5s. for the fourth. The hospital fee (including clinical lectures) is £21 for a perpetual ticket. The classes in St. Mungo's College and in the Glasgow Royal Infirmary are for male students exclusively. Further particulars can be obtained in the Calendar of the College, which will be sent free of charge on application to the Hon. Secretary, Mr. Henry Lamond, 93, West Regent-street, Glasgow.

**GLASGOW WESTERN MEDICAL SCHOOL.**—This School is situated in University-avenue, close to the University and Western Infirmary, in which latter students obtain their Hospital Practice and Clinical Lectures. Lectures and

Demonstrations are given on Chemistry, on Surgery, on Practice of Physic, on Midwifery and Gynæcology, and on Diseases of the Throat and Nose.

*Class Fees.*—For each course of Lectures the fee is £2 2s., except for Diseases of Throat and Nose, the fee for which class is £1 1s. There is no matriculation fee.

**QUEEN MARGARET COLLEGE, Glasgow.**—Queen Margaret College, hitherto the only college in Scotland for the University education of women, was founded in 1883, and now after nine years has attained to a position of greater honour than the promoters could have anticipated in the earlier days of its history. Within the last two months an important change has taken place in the relation of the College to the University of Glasgow. The Universities Commissioners have empowered the Courts of the several Universities of Scotland to admit women to graduation in such Faculty or Faculties as each Court may think fit, and to provide for the education of candidates either in mixed classes of men and women or in separate classes. Glasgow University Court has preferred the second of these alternatives, and, at the instance of the Council of Queen Margaret College, has accepted an offer made by the Council to hand over to the University the government, the endowments, present and prospective, and, with the consent of the donor, Mrs. Elder, the buildings of Queen Margaret College, the endowment and buildings to be reserved for the exclusive education of women, and the College to become incorporated with the University as its department for women. By this step has been secured the amplest fulfilment of the object continually kept in view by the founders—viz., the provision of a University education for women, for now a full curriculum in arts and medicine is given in Queen Margaret College to women by University professors and lecturers, and attendance on the classes qualifies for admission to the degrees examinations of the University. Queen Margaret College therefore, as being a department of the University of Glasgow, has now a standing which it could have acquired by no other means, while the University obtains a building in which women shall have their own class-rooms, laboratories and reading-rooms, as well as access to the University Library and Museum.

**UNIVERSITY COLLEGE, Dundee.**—Medical Department, Session 1892-93.—The College now forms an integral part of St. Andrews University. The medical classes qualify therefore for the degrees of this and the other Scottish Universities, for the University of London, the Royal University of Ireland, as well as for the licences of the Medical Corporations in England and Scotland. All classes are open to women on equal terms with men. Equipment is at present provided for the first three years of the curriculum. Recently a considerable addition has been made to the temporary anatomical buildings, comprising an enlarged dissecting-room, library, bone-room, private room and work-room. New buildings are also being provided for the departments of zoology, botany and physiology. The Zoological Museum has been very largely increased by recent donations of several thousands of specimens from the British Museum and other sources, and there have been great additions made in the equipment of the department of Physiology by the acquisition of new instruments and apparatus. The lectures and classes for the winter session will commence on Tuesday, Oct. 11th. Natural Philosophy: Professor Steggall and assistant. Chemistry: Professor Frankland, F.R.S., and assistants. Zoology: Professor D'Arcy W. Thompson. Anatomy: Lecturer, Professor Paterson. Physiology: Professor Waymouth Reid. Systematic Surgery: Dr. MacEwan. Clinical Medicine and Surgery: The Visiting Physicians and Surgeons of the Dundee Royal Infirmary, daily.

The lectures and classes for the summer session will commence on Tuesday, May 2nd, 1893.

**DUNDEE ROYAL INFIRMARY.**—*Entrance Scholarships.*—First year: (a) Three Armitstead Scholarships of £20 each, tenable for one year. (These Scholarships were founded and endowed in 1883 by George Armitstead, Esq., M.P.) (b) Three Scholarships of £15 each, tenable for one year. Second year: Three Armitstead Scholarships of £20 each, tenable for one year, to be awarded under the following regulations:—1. These Scholarships will be open to all day students entering upon their second year. Candidates must have attended not less than two regular courses at the College during the year immediately preceding the competition.

## INSTITUTIONS AFFORDING FACILITIES FOR CLINICAL OBSERVATION.

**ROYAL INFIRMARY, Edinburgh.**—Beds are set apart for clinical instruction by the professors of the University of Edinburgh. Courses of Clinical Medicine and Surgery are also given by the ordinary physicians and surgeons. Special instruction is given in the medical department on Diseases of Women, Physical Diagnosis, and on Diseases of the Skin; and in the surgical department on Diseases of the Eye, the Ear, the Larynx, and the Teeth. Separate wards are devoted to Venereal Diseases, Diseases of Women, Diseases of the Eye, the Ear, and the Skin, also to cases of Incidental Delirium or Insanity. Post-mortem examinations are conducted in the anatomical theatre by the pathologists, who also give practical instruction in Pathological Anatomy and Histology. The fees for hospital attendance are as follows—viz.: Perpetual ticket, in one payment, £12; annual ticket, £6 6s.; six months, £4 4s.; three months, £2 2s.; monthly, £1 1s. Separate payments amounting to £12 12s. entitle the student to a perpetual ticket. No fees are paid for any medical or surgical appointment. The appointments are as follows:—1. Resident physicians and surgeons are appointed, and live in the house free of charge. The appointment is for six months, but may be renewed at the end of that period by special recommendation. 2. Special non-resident clerks are appointed for six months. The appointment may be renewed for a like period by special recommendation. 3. Clerks and dressers are appointed by the physicians and surgeons. These appointments are open to all students and junior practitioners holding hospital tickets. 4. Assistants in the pathological department are appointed by the pathologists.

**EDINBURGH EYE, EAR, AND THROAT INFIRMARY, 6, Cambridge-street, Lothian-road.**—Clinical Lectures and Instruction are given in this institution, which is open at 1 o'clock daily for out-door patients for Eye Diseases; Mondays, Thursdays, and Saturdays at 12 noon for out-door Ear Patients; and Tuesdays and Fridays at 4 P.M. for out-door Throat Patients. Those whose diseases require operations or more than ordinary care are accommodated in the house. Consulting Surgeon: Dr. Joseph Bell, F.R.C.S. Surgeons: Dr. J. J. Kirk Duncanson, Dr. G. Hunter Mackenzie, Dr. William George Sym, and Dr. Alexander Black. Dental Surgeon: Mr. G. W. Watson, L.D.S. Treasurer and Secretary: Mr. A. P. Purves, 12, Queen-street.

**GLASGOW HOSPITAL AND DISPENSARY FOR DISEASES OF THE EAR, 28, Elmbank-crescent.**—The hospital, which contains twelve beds for in-door patients, is always open for urgent cases. Hours of surgeons' visits 2 P.M. daily; clinical teaching daily. Out-patients are seen on Mondays, Tuesdays, Wednesdays, Thursdays, Fridays, and Saturdays, at 2 P.M., by Dr. Barr and assistants; and operations and special demonstrations to students and practitioners take place on Thursdays from 3 to 4 P.M.

**GLASGOW WESTERN INFIRMARY.**—This hospital adjoins the University of Glasgow. Number of beds upwards of 400. Special wards are set apart for Diseases of Women and for Affections of the Skin. In the out-patient department there are special clinics for Diseases of Women and for Diseases of the Throat, Ear, and Teeth. The Clinical Courses are given by the Physicians and Surgeons, each of whom conducts a separate class, and students require to enter their names at the beginning of the session for the class which they propose to attend. Special instruction is given to junior students by tutors or assistants, and clinical clerks and dressers are selected from the members of the class. All the courses of clinical instruction are recognised by the University of Glasgow and the other boards in the kingdom. In the Pathological Department the course is both systematic and practical, and extends through the winter and following summer; these are likewise recognised by the University for graduation. Eight resident assistants are appointed annually, without salary, from those who have completed their course. The fee for the hospital practice, including the various courses of clinical instruction, is 20 guineas in one payment, or in two equal instalments for the first and second year; for six months, 7 guineas; and for three months, 4 guineas.

**ROYAL HOSPITAL FOR SICK CHILDREN, Glasgow, situated at Garnet-hill.**—This hospital was opened in December, 1882, and is now available to medical students for clinical instruction in the diseases peculiar to childhood. The

hospital includes 70 beds for non-infectious cases only. A specially designed Dispensary, or Out-patient Department, was opened in October, 1888. Students may be enrolled at any time. Fee, £1 1s. Particulars on applying to House Surgeon, 45, Hill-street, Garnet-hill, Glasgow.

**GLASGOW OPHTHALMIC INSTITUTION**, 126, West Regent-street (40 beds)—Clinical and systematic course of lectures for students during the winter and summer seasons. In-patients, 531; out- or dispensary patients, 3219. Operations on Wednesdays and Saturdays. Consulting Physician: Samuel J. Moore, Esq., M.D. Acting Surgeon: J. R. Wolfe, Esq., M.D., F.R.C.S. Ed. Acting Physician: J. S. Cumming, Esq., M.D. Assistant Surgeon: A. T. Thomson, M.D. This institution has recently been amalgamated with the Glasgow Royal Infirmary, of which it forms an integral part. The work is carried on provisionally at the above address until a new house is erected on the Infirmary ground.

**GLASGOW EYE INFIRMARY**, Berkeley-street and Charlotte-street.—This institution, the largest of its kind in the West of Scotland, was founded in 1824. The Infirmary now consists of two large buildings—both in Berkeley-street being occupied as the Infirmary proper, and that in Charlotte-street as a dispensary. The Infirmary is devoted exclusively to the treatment of Diseases of the Eye, and is intended primarily to provide treatment, and, when necessary, board and lodging for those who are unable to do so for themselves, and are properly recommended to the Directors. The average number of new patients for the last ten years has been 10,381.5, and the total number of cases treated in 1891 was 15,210. The Medical Staff is as follows:—Senior Surgeon: Thomas Reid, M.D., Waltonian Lecturer in the University of Glasgow. Surgeons: Thomas S. Meighan, M.D., A. Freeland Fergus, M.D., and A. Maitland Ramsay, M.D. Assistant Surgeons: William Robertson, M.B., C.M., Andrew Wilson, M.B., C.M., and James Hinshelwood, M.D. Pathologist: Robert M. Buchanan, M.B., C.M. House Surgeon: Leslie Buchanan, M.B. Consulting Surgeon: George Buchanan, M.D.

*Regulations as to Attendance of Students.*—(1) Gentlemen may attend as students on payment to the treasurer of the following fees:—For three months £1 1s., six months £2 2s., twelve months £3 3s. (2) Students attending the Waltonian Lectures in the University of Glasgow may attend at the Infirmary for clinical instruction during the University Session without fee. Former Waltonian students may attend on payment of the following fees:—For six months £1 1s., twelve months £2 2s. (3) All students when duly entered in the Infirmary Register may attend the clinical instruction of any or every member of the medical staff on production of their tickets. The days on which the surgeons respectively attend to receive patients may be ascertained at the Infirmary. Secretary: William George Black, 88, West Regent-street.

**ABERDEEN ROYAL LUNATIC ASYLUM**.—Contains about 650 beds. Medical Superintendent: Dr. William Reid. Assistant Physicians: Drs. C. Angus and A. Davidson. Secretary: Mr. W. Carnie. Clinical instruction is given to students during three months in summer.

**ABERDEEN ROYAL INFIRMARY**.—Contains about 200 beds. Physicians: Drs. Angus Fraser and P. B. Smith, Professor Finlay, and Dr. James Rodger. Assistant Physician. Surgeons: Professor A. Ogston, Drs. R. J. Garden and M. K. Booth, and J. S. Riddell. Assistant Surgeon. Ophthalmic Surgeon: Dr. J. Mackenzie Davidson. Pathologist: Professor David James Hamilton. Dental Surgeon: Dr. Williamson. Treasurer and Secretary: Mr. W. Carnie.

## IRISH SCHOOLS OF MEDICINE.

**QUEEN'S COLLEGE SCHOOL OF MEDICINE**, Belfast.—Eight Junior Scholarships have been founded in the Faculty of Medicine, of the annual value of £25 each. Two are tenable by matriculated students, of the first, second, third, and fourth year of their course respectively. The examinations for Junior Scholarships in the Faculty of Medicine take place at the commencement of the session. Matriculated students in Medicine intending to compete for Medical Scholarships of the second year must be of not more than one year's standing as students of Medicine, and must have attended, in some of the Queen's Colleges, or in a university capable of granting degrees

in Medicine, two at least of the following courses—viz.: Chemistry, Botany and Zoology, Anatomy and Physiology, Materia Medica and Pharmacy, Practical Chemistry, Practical Anatomy. Matriculated students in Medicine intending to compete for Medical Scholarships of the third year must be of two years' standing and not more, and must have attended, in some of the Queen's Colleges, or in a University capable of granting degrees in Medicine, four at least of the following courses—viz.: Chemistry, Botany, and Zoology, Anatomy and Physiology, Materia Medica and Pharmacy, Practical Chemistry, Practical Anatomy. Matriculated students in Medicine intending to compete for Medical Scholarships of the fourth year must be of three years' standing and not more, and must, in addition to the qualifications prescribed above, have attended, in their third year, two at least of the following courses—viz.: Theory and Practice of Medicine, Theory and Practice of Surgery, Midwifery, and Diseases of Women and Children.

**QUEEN'S COLLEGE SCHOOL OF MEDICINE**, Cork.—The building is provided with a very large, well-ventilated dissecting room, with physiological and toxicological laboratories, materia medica, anatomical and pathological museums, as well as a room for surgical and obstetrical instruments and appliances. There are well-appointed physical and chemical laboratories, and a large natural history museum in the adjoining building, and part of the College ground is laid out as a botanical garden. The plant houses are now completed and well filled with plants, and are open to the students in the class of Botany.

*Fees.*—For Practical Anatomy and for Practical Chemistry, £3 each course; for Anatomy and Physiology, £3 first course, and £2 for each subsequent course. Other medical classes, £2 first course, and £1 each subsequent course. Eight scholarships (value about £30 each), as well as several exhibitions and class prizes, are awarded every year.

## IRISH ANCILLARY MEDICAL SCHOOLS.

**ADELAIDE MEDICAL AND SURGICAL HOSPITALS**, Peter-street, Dublin.—Fee for nine months' hospital attendance, £12 12s.; six months, £8 8s. Summer, three months, £5 5s.

*Staff.*—Physicians: Henry H. Head, M.D., M.R.I.A.; James Little, M.D., M.R.I.A. Surgeons: J. Kellock Barton, M.D., F.R.C.S.I.; Kendal Franks, M.D., F.R.C.S.I.; F. T. Heuston, M.D., F.R.C.S.I.; J. H. Scott, M.B., F.R.C.S.I. Obstetric Surgeon: R. D. Purefoy, M.B., F.R.C.S.I. Ophthalmic Surgeon: H. R. Swanzy, M.B., F.R.C.S.I. Assistant Physicians: Wallace Beatty, M.D., F.R.C.P.I.; H. F. Bewley, M.D., F.R.C.P.I. House Surgeon: F. W. Staunton, M.B., B.Ch.

A resident surgeon is elected yearly, and three resident pupils half-yearly. At the termination of the session, prizes in Clinical Medicine and Surgery, and in Obstetric Medicine, will be awarded.

*Hudson Scholarship.*—In addition to the junior prizes, the Hudson Scholarship, £30 and a gold medal, as well as a prize of £10, together with a silver medal, will be awarded at the end of the session for proficiency in Clinical Medicine and Medical Pathology, Clinical Surgery and Surgical Pathology, Pathological Histology, Surgical Appliances, including instruments and bandaging, Ophthalmology and Gynecology.

The certificates of attendance are recognised by all the universities and licensing bodies in the United Kingdom.

**COOMBE LYING-IN HOSPITAL AND GUINNESS DISPENSARY FOR THE TREATMENT OF DISEASES PECULIAR TO WOMEN.**—This hospital contains nearly 70 beds, and consists of two divisions, one of which is devoted to lying-in cases, and the other to the treatment of the diseases peculiar to women. The maternity department is one of the largest in Ireland, 3000 cases being annually treated either as intern or extern patients. A regular course of lectures is delivered in the hospital, and clinical instruction is given daily at the bedside. There are two large dispensaries connected with the institution, at one of which instruction is given on the general diseases of women and children, and, in the other, on the diseases peculiar to women. There is accommodation for a limited number of intern pupils, who enjoy exceptional advantages of acquiring a practical knowledge of this branch of their profession. Two Resident Pupil

‡ Zoology in Winter; Botany in Summer.

† In Winter and in Summer.

\* In Summer.

Midwifery Assistants and one Clinical Clerk are elected half-yearly from among the pupils of the hospital. Certificates of attendance at this hospital are accepted by all licensing bodies, and the diploma is recognised by the Local Government Board as a full legal midwifery qualification. Fees (six months' course): Extern pupils, 8 guineas, half payable in advance; intern pupils, 18 guineas for six months' residence. If pupils enter as interns by the month, the fees are £4 4s. for first month, and £3 3s. for each succeeding month. Intern pupils enjoy very special advantages, which can be learned on application. Registration fee on entrance, 10s. 6d. Students can enter for attendance at any time. Further particulars may be had on application to the Master or the Registrar at the hospital.

**SIR PATRICK DUN'S HOSPITAL.**—Fees for attendance of students—nine months, £12 12s.; six months, £8 8s.; three months, £5 5s. The hospital is open to extern students as well as to the students of Trinity College, and the certificates are recognised by all the licensing bodies in the kingdom. Dr. Ball, Secretary to the Medical Board, will give any further information.

**MATER MISERICORDIÆ HOSPITAL, Dublin.**—Consulting Physician: Dr. Francis R. Cruise. Physicians: Drs. Christopher J. Nixon, Joseph M. Redmond, Michael A. Boyd, and John Murphy. Surgeons: Messrs. Patrick J. Hayes, Charles Coppinger, Arthur Chance, and John Lentaigne. Obstetric Physician: Dr. Thos. More Madden. Ophthalmic Surgeon: Mr. Louis Werner. Dental Surgeon: Mr. Daniel Corbett, jun. Pathologist: Mr. Edmond J. McWeeney. House Physician: Dr. Frank Dunne. House Surgeons: Messrs. Jeremiah Dowling and Michael O'Sullivan. This hospital, the largest in Dublin, at present containing 311 beds, is open at all hours for the reception of accidents and urgent cases. Fifty beds are specially reserved for the reception of patients suffering from fever and other contagious diseases. Instruction at the bedside will be given by the Physicians and Surgeons at 9 A.M. daily. Clinical Instruction will commence on Monday, October 3rd, at 9 o'clock A.M. A course of Clinical Instruction on Fever will be given during the winter and summer sessions. A certificate of attendance upon this course, to meet the requirements of the licensing bodies, may be obtained. Opportunities are afforded for the study of Diseases of Women in the ward under the care of the Obstetric Physician, and at the Dispensary held on Tuesdays and Saturdays. Ophthalmic Surgery will be taught in the Special Wards and Dispensary. Surgical Operations will be performed on Mondays, Tuesdays, Thursdays and Saturdays, at 10 o'clock. Connected with the hospital are extensive Dispensaries, which afford valuable opportunities for the study of general Medical and Surgical Diseases, Accidents, &c. Instruction will be given on Pathology and Bacteriology. Junior Appointments: A House Physician and two House Surgeons will be appointed annually. Eight resident pupils will be elected from the most attentive of the class to hold office for six months. For the current session the elections will take place on Nov. 1st, 1892, and May 1st, 1893, at 11 o'clock A.M. Dressers and Clinical Clerks will be appointed, and certificates will be given to those who perform their duties to the satisfaction of the staff. Leonard Prizes: One Gold and one Silver Medal will be offered for competition annually, in the subject of Medicine, and one Gold and one Silver Medal in the subject of Surgery. Junior Leonard Prizes: One prize value £3 and one prize value £2 will be awarded in Medicine and one prize value £3 and one prize value £2 will be awarded in Surgery. They will be awarded on the aggregate of marks gained for Reports of Cases and at a Clinical Examination to be held at the close of the summer session. For further particulars see prospectus. Certificates of attendance upon this hospital are recognised by all the Universities and licensing bodies in the United Kingdom. Private Wards have been opened for the reception of Medical and Surgical cases. A Training School and Home for Trained Nurses have been opened in connexion with the Hospital.

*Terms of attendance.*—Nine months, £12 12s.; six winter months, £8 8s.; three summer months, £5 5s. A prospectus containing in detail the arrangements for Clinical Instruction, Prizes, &c., may be obtained from the Secretary, Dr. Joseph Redmond, 8, Clare-street.

**RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS, North Brunswick-street, Dublin.**—These hospitals contain

312 beds—110 for Surgical cases, 82 for Medical cases, and 120 for Fever and other epidemic diseases.

**ROTUNDA HOSPITAL, Rutland-square, Dublin.**—This institution consists of two distinct hospitals—namely, the Lying-in Hospital and the Auxiliary Hospital, the latter for the reception of patients suffering from Uterine and Ovarian Diseases. There is also a large extern maternity and a Dispensary for Diseases peculiar to Women, which is open daily. Clinical instruction is given daily (Saturdays excepted) in Midwifery and the Diseases peculiar to Women, special attention being directed to the application of anti-septics in midwifery, and lectures on these subjects are delivered regularly throughout the session. Accommodation is provided for a limited number of intern pupils.

**DR. STEEVENS'S HOSPITAL.**—This hospital, containing beds for 250 patients, is situated close to the Kingsbridge Terminus of the Great Southern and Western Railway, occupying a position in the centre of one of the busiest manufacturing districts of the city, otherwise unprovided with medical institutions, and affords exceptional advantages for clinical instruction. Immediately adjoining is St. Patrick's (Swift's) Asylum for the Insane. The hospital is easily accessible by two lines of tramways. There is a ward entirely devoted to Syphilitic Disease, a detached building for Fever Cases, and an extensive Out-patient Department, with separate Clinics for Diseases of the Skin, Throat, Eye, Ear and Teeth.

The hospital is visited daily at 8.30 A.M. by the resident surgeon, and at 9 A.M. by the physicians and surgeons. The surgical wards are also visited each evening. Clinical Lectures are given by the physicians and surgeons during the session. There is accommodation in the hospital for two medical and six surgical resident clinical assistants, who, in addition to their rooms and furniture, are provided with coals and gas.

*Fees.*—Hospital Practice: Nine months, £12 12s.; six months, £8 8s.; three months, £5 5s. Dressership: £10 10s. each three months.

## AMERICAN MEDICAL SCHOOLS.

The most important event in the forthcoming session of American schools is the announcement of the adoption of a four years' course by the three leading colleges, Harvard, the University of Pennsylvania and the College of Physicians and Surgeons of New York. The change is to take effect this session at Harvard. The credit of having been the first to adopt the four years' graded course belongs, however, to the University of Michigan, and it is gratifying to hear that the change has been most satisfactory.

**UNIVERSITY OF PENNSYLVANIA, Philadelphia.**—The rapid increase in the number of students which has taken place in the past two sessions, while taxing the teaching capacity, has been a gratifying indication that the profession is ready for higher medical education. The fourth session, which will be compulsory on all students entering after October, 1893, will, it is anticipated, cause a reduction in the income of about 25 per cent., and to meet this probable deficit a guarantee fund has been raised. An important recent event in this school was the opening of the Hygiene Laboratory. The cost of the building (\$50,000) was provided by the well-known medical publisher, Henry C. Lea; and an Endowment Fund of nearly \$200,000 has been raised by the Provost, Dr. Pepper, under whose guidance during the past ten years the University has so rapidly developed in all its branches. The Laboratory is under the direction of Dr. John S. Billings, of the Army Medical Department, who devotes a certain amount of time each week to the work. The practical classes are under the control of Dr. A. C. Abbot. Dr. Hayes Agnew, the Nestor of American surgeons, and Emeritus Professor in the school, died during the past session. As an acknowledgment, no doubt, of the great value of his connexion with the medical school, he left \$50,000 to the University Hospital. The death is also announced of Dr. Formad, the Demonstrator of Pathology, who as coroner's physician was of great service in supplying the classes with material in morbid anatomy.

**HARVARD.**—For the first time one of the large schools of the Eastern States opens with a four years' curriculum. It is just twenty years ago since Harvard adopted a compulsory three years' course, and the success which

followed this, as well as other important changes, is the best guarantee for the future. The Sears Laboratory for Pathology and Bacteriology is now fully equipped and in working order. Dr. Ernst has been appointed Professor of Bacteriology. Dr. Fitz has been transferred from the chair of Pathology to that of Medicine, and the vacancy thus caused in the former has been filled by the appointment of Dr. Councilman, Associate Professor of Pathology in the Johns Hopkins University. It is rumoured that Dr. Howell, the Professor of Physiology in the University of Michigan, is to join the Harvard School as associate of Dr. Henry P. Bowditch, whose executive duties as Dean do not enable him to devote sufficient time to laboratory teaching. Efforts are being made by friends of the school to organize a hospital under the control of the Faculty. The clinical advantages of the Massachusetts General and the Boston City Hospitals are ample and readily available, but in appointments to the practical chairs the choice at present is limited to men holding positions on the staff of one or other of these hospitals, and this is felt to be an anomaly. Mention must be made of the death during the past session of Dr. Henry J. Bowditch, the Emeritus Professor of Clinical Medicine, whose work did so much to extend the reputation of the school.

**COLLEGE OF PHYSICIANS AND SURGEONS OF NEW YORK.**—The magnificent gifts of the Vanderbilt family have enabled the school to take an advanced position among the teaching bodies. The recent union with Columbia College, the oldest and richest of the universities in the State of New York, which guarantees the salaries of the professors, has made progress easy, and within a short time of the adoption of a compulsory three years' course a fourth year is announced. No changes of any moment have occurred on the teaching staff. Dr. McBurney's new operating theatre, by far the most elaborate and costly on the continent, has been completed.

**JOHNS HOPKINS UNIVERSITY.**—The undergraduate department in medicine has not yet been organised, as the professors of pharmacology and anatomy have not yet been appointed. It is hoped that at an early date the funds of the University will permit of the building of the necessary laboratories for these branches. Meanwhile graduate teaching is carried on at the hospital and in the pathological laboratory. Qualified practitioners are admitted to the wards and operating rooms on payment of a fee of \$100 or for a less sum to the individual clinics. During the months of January, February, and March there is a regularly organised graduate course, with lectures, demonstrations, and ward work—Professor Osler and assistants in Medicine, Professor Halsted in Surgery, and Professor Kelly in Gynecology. Special students are admitted at any time. In the Pathological Department (Professor Welch) systematic instruction is given throughout the winter in Morbid Anatomy and Histology, and in Bacteriology (Dr. Nuttal). Several changes in the *personnel* of the staff have occurred within the past year. Dr. Councilman, Associate in Pathology, has been called to the chair of Pathology at Harvard; Dr. Abbott has gone to the Hygienic Institute of the University of Pennsylvania, and is succeeded as bacteriologist by Dr. Nuttal; Dr. Flexner succeeds Dr. Councilman as Associate in Pathology; and Dr. Barker has been appointed Fellow in Pathology.

## CANADIAN MEDICAL SCHOOLS.

**MCGILL UNIVERSITY.**—No special changes have occurred. Steps are being taken to raise money for the pathological department, and an advertisement has appeared in our columns asking for applications for the chair of Pathology. Among the candidates are Drs. Savill and Ruffer of London and Dr. Muir of Edinburgh. Dr. George Ross, the Professor of Medicine, who has been in ill-health, has associated with him in the chair Dr. Lalleur, lately first assistant in the medical clinic at the Johns Hopkins Hospital.

The new clinical wards and amphitheatre at the Montreal General Hospital are ready for occupation, and will materially enhance the teaching facilities. The Royal Victoria Hospital is approaching completion.

## MEDICAL TEACHERS.

Mr. J. BECKTON, assisted by his son, H. BECKTON, B.A. (Graduate in Honours, late Scholar of Clare College, Cambridge), prepares candidates for the London Matriculation, Medical and Law Preliminary, University Entrance, Local, and other Examinations. Boarders received.—19, Keppel-street, late 140, Gower-street, W.C.

Mr. J. COATES, 1st B.A., M.C.P., prepares candidates for Matriculation, College of Preceptors, Apothecaries' Hall, Pharmaceutical Society, and the Professional Examinations of the Conjoint Board of the Royal Colleges of Surgeons and Physicians. Laboratory fitted with every requisite. Terms moderate.—30 to 32, Ludgate-hill, E.C.

M.D., B.S. Lond., M.R.C.P. Lond., prepares Personally and by Correspondence in a systematic and thorough manner for all the Examinations of the Colleges of Physicians and Surgeons, the Universities, the Services, the M.D.'s of Durham, St. Andrews, and Brussels, and for the Apothecaries' Hall.—64, Guilford-street, Russell-square, W.C.

Mr. A. H. DAVIES, 1st B.A. Lond., gives lessons privately, in class or by post, in preparation for the London Matriculation and Medical Preliminary Examinations.—55 and 60, Chancery-lane, W.C.

Mr. J. GIBSON, M.A., prepares candidates for the London Matriculation and Preliminary Medical and Legal Examinations.—Quornmore, Bromley, Kent, and 24, Chancery-lane, E.C. Mr. Gibson brings out directly after each examination a "Guide" containing the questions set at the examination, followed by solutions in full.

Mr. RNT GOOCH, B.Sc. (Honours) Lond., B.A. Lond., F.G.S., (for many years associated with the late Mr. H. Sergeant, B.A.), assisted by experienced graduates, prepares for Preliminary Scientific, B.Sc. degree, Conjoint Board, Matriculation, and Preliminary Medical. Special Classes in Chemistry, Materia Medica, Botany, Zoology, Anatomy, and Physiology. Laboratory work. Recently passed fifteen.—33, Alfred-place, Gower-street, W.C.

Mr. FRANK W. GREGG, "Ruby House," Mayflower-road, Clapham, S.W., instructs pupils for the London Matriculation Examination and all Medical Preliminary and Scientific Examinations required by the various Examining Boards. Mr. Gregg will receive boarders on moderate terms, which may be had on application.

Mr. A. J. MAINWARING, M.A., 1st M.B. Cantab., prepares candidates for all Preliminary Examinations.—115, Edith-road, West Kensington.

Mr. JOHN T. SAILLÉ, B.A. Lond., (for eighteen years with the late Mr. HENRY SERGEANT), holds special classes, morning and evening, for London University Matriculation, the Preliminary Medical Examinations, &c.—University Institute, 102, Fuston-road.

Mr. HENRY WAITE prepares pupils for Matriculation, Preliminary Scientific, and the Examinations for Medical Registration of all the licensing bodies.—25, Dingwall-road, Earlsfield-road, Wandsworth.

Mr. J. WOODLAND, F.L.S., F.C.S., &c. (late Lecturer on the Art of Prescribing, and Teacher of Materia Medica at St. George's Hospital), reads privately with many for University and other examinations.—Interview at 173, Marylebone-road, N.W., by appointment only.

### INSTRUCTORS IN ELOCUTION &c.

Dr. ALTSCHUL has made Stuttering, Stammering, Lipping, Falsetto, recent or of long standing, due to Nervousness, &c., irrespective of Age or Sex (without any Mechanical appliances), his Special, Life-long study. The Voice greatly Developed and Strengthened.—9, Old Bond-street, W. (attends at Brighton).

Mr. H. N. DIXON, M.A. Lond. and Cambridge, F.L.S., gives a thorough and high-class Education to Deaf Children, based upon the Oral Method. Special arrangements made for very young children.—Apply, Wickham House, East Park Parade, Northampton.

Mr. WILLIAM VAN PRAAGH, the public introducer of the Pure Oral System of Teaching Deaf Mutes, has made the subject of Lip-reading and the cure of all Defects of Speech, both acquired and congenital, his special study. Papers on the various subjects can be had free at 11, Fitzroy-square, W.

Mr. H. W. WHITE educates Deaf and Dumb Children of the higher classes on the Pure Oral System; also deals with cases of Defective Speech, and has many testimonials from parents. Lip reading lessons given to adults who have lost their hearing. References to the highest medical authorities.—13, Sinclair Gardens, Kensington, W. Next term Sept. 20th.

## CLINICAL INSTRUCTION IN INFECTIOUS DISEASES.

THE Metropolitan Asylums Board now offer facilities to students whereby they may obtain instruction in the subject of infectious diseases supplemented by clinical observation of cases at any of the fever hospitals of the Board, and classes open to students and qualified men are held at the Eastern Hospital, Homerton; the North-Western Hospital, Haverstock-hill; the Western Hospital, Fulham; the South-Western Hospital, Stockwell; and the South-Western Hospital, New Cross-road, three times during the year. The next course will begin early in October. A certificate of attendance, now required by the Conjoint Board of the Royal Colleges of Physicians and Surgeons, as part of the five years' curriculum of every medical student entering the profession, is granted to students who have satisfactorily completed a course of study. The fee for attendance is three guineas for a course of two months. Applications should be made to the Clerk to the Metropolitan Asylums Board, Norfolk House, Norfolk-street, Strand, from whom all necessary information can be obtained.

## SCHOLARSHIPS GIVEN IN AID OF MEDICAL STUDY.

THE following list is as nearly complete as the Editors have been able to make it, and gives such prizes as would enter into a Student's calculation of the cost of Medical education. It does not contain prizes of less value than £10, or prizes of greater than this value which are given in any form except money or necessaries of medical study and research:—

INSTITUTION.	TITLE OF SCHOLARSHIP & C.	ANNUAL OR TOTAL VALUE.	HOW LONG TENABLE.	HOW OBTAINABLE.	CONDITIONS ATTACHED TO TENURE.
OXFORD UNIVERSITY ..	Burdett-Coutts Scholarships.	£80 per annum.	2 years.	Competitive Examination.	....
	Radcliffe Trav. Fellowship.	£200 " "	3 years.	Ditto.	Foreign Travel for purpose of Medical Study.
	Rolleston Prize.	£60 " "	....	Original Research.	M.B. taken within 3 years.
LONDON UNIVERSITY ..	....	£40 per annum.	2 years.	By first place with distinction in ANATOMY at July Intermediate M.B. Examination.	Ditto.
		£40 per annum.	2 years.	By first place, with distinction in PHYSIOLOGY AND HISTOLOGY at July Intermediate M.B. Examination.	Ditto.
		£30 per annum.	2 years.	By first place with distinction in ORGANIC CHEMISTRY at July Intermediate M.B. Examination.	Ditto.
		£30 per annum.	2 years.	By first place with distinction in MATERIA MEDICA and PHARMACEUTICAL CHEMISTRY at July Intermediate M.B. Examination.	Ditto.
	University Scholarship in Medicine.	£50 per annum.	2 years.	By first place with distinction in MEDICINE at M.B. Honours Examination.	Ditto.
	University Scholarship in Obstetric Medicine.	£30 per annum.	2 years.	By first place with distinction in OBSTETRIC MEDICINE at M.B. Honours Examination.	
	University Scholarship in Forensic Medicine.	£30 per annum.	2 years.	By first place with distinction in FORENSIC MEDICINE at M.B. Honours Examination.	
	University Scholarship in Surgery.	£50 per annum.	2 years.	By first place with distinction in B.S. Honours Examination.	
*EDINBURGH UNIVERSITY	Theses Gold Medals.	....	....	Candidates for M.D. who present Theses of high merit.	None.
	Syme Surgical Fellowship.	£105 17s. 6d. per annum.	2 years.	Competitive Thesis by M.B. of not more than three years' standing.	None.
	Leckie Maclier Fellowship.	£70 per annum.	3 years.	Competitive Examination among M.B.'s of not more than three years' standing.	None.
	Sibbald Scholarship.	£40 per annum.	3 years.	Competitive Examination among University Students.	None.
	Hope Prize.	£25.	....	Distinction in MINOR CHEMICAL CLASS.	None.
	Vans Dunlop Scholarship.				
	" No. 1.	£100.	3 years.	First place in MEDICAL PRELIMINARY EXAMINATION.	None.
	" No. 2.	£100.	3 years.	NAT. HISTORY, BOTANY, and GEOLOGY.	None.
	" No. 3.	£100.	3 years.	Highest marks in Class Examinations in PHYSIOLOGY and SURGERY.	None.
	" No. 4.	£100.	3 years.	Competitive Examination in ANATOMY, PHYSIOLOGY, MATERIA MEDICA, and PATHOLOGY.	One year's study at the University, and 2 years' original research
	Murchison Memorial Scholarship.	Interest on £1000.	1 year.	Competitive Examination in CLINICAL MEDICINE among registered Students of Medicine.	None.
	Buchanan Scholarship.	Interest on £1000.	1 year.	Competitive Examination and Class Work in MIDWIFERY and GYNECOLOGY.	None.
	James Scott Scholarship.	£45 per annum.	1 year.	Competitive Examination and Class Work in MIDWIFERY.	None.
	Ettles Scholarship in Medicine.	£35.	....	Distinction in M.B. and M.S. Examination.	None.
	Mackay Smith Scholarship in Chemistry.	£25 per annum.	2 years.	Competitive Examination in CHEMISTRY among University Students.	None.
	Sibbald Bursary.				
	" No. 1.	£30.	....	....	....
	" No. 2.	£30.	....	....	....
	Heriot Bursary.				
	" No. 1.	£30 per annum.	3 years.	Competitive Examination among Matriculating Students.	None.
	" No. 2.	£30 per annum.	3 years.	Ditto.	None.
	Thomson Bursary.				
	" No. 1.	£25 per annum.	4 years.	Distinction in Preliminary Medical Examination.	None.
	" No. 2.	£25 per annum.	4 years.	Distinction in Preliminary Medical Examination.	None.
	Grierson Bursary.				
	" No. 1.	£20 per annum.	1 year.	Distinction in Preliminary Medical Examination. (Holder must be native of Crawford or Leadhills.)	None.
	" No. 2.	£20 per annum.	1 year.	Competitive Examination in CHEMISTRY, BOTANY, and NATURAL HISTORY among Second-year Students. (Holder must be native of Crawford or Leadhills.)	None.
	" No. 3.	£20 per annum.	1 year.	Ditto.	None.

\* Several Fellowships, Scholarships, Bursaries, &c., are not mentioned in the above list, which are occasionally vacant in alternate years.

## SCHOLARSHIPS GIVEN IN AID OF MEDICAL STUDY—continued.

INSTITUTION.	TITLE OF SCHOLARSHIP & C.	ANNUAL OR TOTAL VALUE.	HOW LONG TENABLE.	HOW OBTAINABLE.	CONDITIONS ATTACHED TO TENURE.	
EDINBURGH UNIVERSITY —continued.	Grierson Bursary. " No. 4.	£20 per annum.	1 year.	Competitive Examination in ANATOMY and PHYSIOLOGY among Third-year Students. (Holder must be native of Crawford or Leadhills.)	None.	
	" No. 5.	£20 per annum.	1 year.	Competitive Examination in MATERIA MEDICA and PATHOLOGY among Fourth-year Students. (Holder must be native of Crawford or Leadhills.)	---	
	Dr. J. A. Carlyle Bursary. " No. 1.	£28 per annum.	1 year.	Proficiency in Class Examinations in ANATOMY and CHEMISTRY.	None.	
	" No. 2.	£28 per annum.	1 year.	Proficiency in Class Examinations in ANATOMY and PHYSIOLOGY.	None.	
	Mackenzie Bursary. " No. 1.	£21 5s.	....	Industry and Skill in Junior Class work of PRACTICAL ANATOMY.	None.	
	" No. 2.	£21 5s.	....	Industry and Skill in Senior Class work of PRACTICAL ANATOMY.	None.	
	Beaney Prize.	£37 10s.	....	Highest Marks taken in ANATOMY, SURGERY, and CLINICAL SURGERY, by University Student in M.B. and C.M. Examinations.	None.	
	Hope Chemistry Prize.	£100.	....	Competitive Examination among University Students.	None.	
	Neil Arnott Prize.	£42.	....	Distinction in Natural Philosophy in the M.A. Examination.	None.	
	Wightman Prize.	£10 10s.	....	Competitive Reports on Cases by Clinical Students.	None.	
	ST. BARTHOLOMEW'S MEDICAL SCHOOL	Entrance Scholarships No 1.	£75.	....	Open Competitive Examination in PHYSICS and CHEMISTRY.	Full Course at St Bartholomew's Hospital.
		" No. 2.	£75.	....	Open Competitive Examination in BIOLOGY and PHYSIOLOGY.	Ditto.
		" No. 3.	£150.	....	Open Competitive Examination in PHYSICS, CHEMISTRY, and BIOLOGY.	Ditto.
Preliminary Scientific Exhibition.		£50.	....	Open Competitive Examination in PHYSICS, CHEMISTRY, and BIOLOGY.	Ditto.	
Jeaffreson Exhibition.		£20.	....	Open Competitive Examination in LATIN, MATHEMATICS, and GREEK, FRENCH, or GERMAN.	None.	
Shuter Scholarship.		£50.	....	Competitive Examination among Cambridge Graduates in ANATOMY, PHYSIOLOGY, and MATERIA MEDICA.	None.	
Junior Scholarship. " No. 1.		£30.	....	Competitive Examination among Students in ANATOMY and PHYSIOLOGY.	None.	
" No. 2.		£20.	....	Ditto.	None.	
Senior Scholarship.		£50.	....	Competitive Examination among Students in ANATOMY, PHYSIOLOGY, and CHEMISTRY.	Study at St. Bartholomew's Hospital.	
Kirkes' Scholarship. Brackenbury Scholarships. " No. 1. " No. 2.		£30 and Medal. £30. £30.	.... .... ....	Competitive Examination among Students in CLINICAL MEDICINE. Competitive Examination among Students in MEDICINE. Competitive Examination among Students in SURGERY.	None.	
Lawrence Scholarship.	£42 and Medal.	....	Competitive Examination among Students in SURGERY, MEDICINE, and MIDWIFERY.	None.		
Sir Geo. Burrows' Prize. Skynner Prize.	£10 10s. £15.	.... ....	Competitive Examination in PATHOLOGY among Students. Competitive Examination in REGIONAL and MORBID ANATOMY among Students.			
CHARING-CROSS HOSPITAL AND COLLEGE	Entrance Scholarships. " No. 1.	£105.	....	Open Competitive Examination in any three of the following groups of subjects: (1) ENGLISH, including LANGUAGE, LITERATURE, HISTORY, and GEOGRAPHY; (2) LATIN and GREEK; (3) FRENCH and GERMAN; (4) MATHEMATICS, including ARITHMETIC, ALGEBRA, and GEOMETRY, and MECHANICS, including STATICS and DYNAMICS; (5) CHEMISTRY (INORGANIC) and PHYSICS, including ACOUSTICS, HEAT, and ELECTRICITY; and (6) ANIMAL and VEGETABLE BIOLOGY.	Full Course at Charing-cross Hospital.	
	" No. 2.	£52 10s.	....	Ditto.	Ditto.	
	" No. 3.	£52 10s.	....	Competitive Examination in ANATOMY and PHYSIOLOGY, open to Students from the University of Oxford who have passed the First M.B. Examination, and to Students from the University of Cambridge who have passed the Second M.B. Examination, and who have not entered at any London Medical School.	Completion of Curriculum at Charing-cross Hospital.	

SCHOLARSHIPS GIVEN IN AID OF MEDICAL STUDY—*continued.*

INSTITUTION.	TITLE OF SCHOLARSHIP &c.	ANNUAL OR TOTAL VALUE.	HOW LONG TENABLE.	HOW OBTAINABLE.	CONDITIONS ATTACHED TO TENURE.
CHARING-CROSS HOSPITAL AND COLLEGE— <i>continued.</i>	Llewellyn Scholarship.	£25.	....	Competitive Examination among Third-year Students in ANATOMY, PHYSIOLOGY, PHARMACOLOGY, MEDICINE, SURGERY, THERAPEUTICS, and MIDWIFERY.	None.
	Golding Scholarship.	£15.	....	Competitive Examination among Second-year General and Dental Students in DESCRIPTIVE ANATOMY, PHYSIOLOGY, and CHEMISTRY.	
ST. GEORGE'S HOSPITAL..	Entrance Scholarships.				
	" No. 1.	£145.	....	Competitive Examination among First-year Students, being the sons of medical men, in LATIN, FRENCH, or GERMAN, and ELEMENTARY PHYSICS, and MATHEMATICS.	Course at St. George's School.
	" No. 2.	£65.	....	Competitive Examination among Students being First M.B.'s of Oxford and Second M.B.'s of Cambridge, in ANATOMY and PHYSIOLOGY.	Ditto.
	" No. 3.	£65.	....	Ditto.	Ditto.
	" No. 4.	£50.	2 Scholarships.	Competitive Examination among Students in the same subjects as Entrance Scholarship No. 1.	Complete Course at St. George's School.
	" No. 5.	£50.	....	Ditto.	Ditto.
	Wm. Brown Exhibition.	£100 per annum.	2 years.	Competitive Examination among Perpetual Students having registrable qualification in the PRACTICE OF MEDICINE, MIDWIFERY, and SURGERY.	None.
	"	£40 per annum.	3 years.	Competition among Third-year Students in respect of fitness for Medical Profession.	None.
	Brackenbury Prize in Medicine.	Interest on £1077.	....	Competitive Examination among Students of not more than five years' standing.	None.
	Brackenbury Prize in Surgery.	Interest on £1077.	....	Competitive Examination among Students of not more than five years' standing.	None.
	Treasurer's Prize.	£10 10s.	....	Proficiency in Clinical Examination of three Medical and three Surgical Cases, together with a written or <i>visu-voce</i> Examination in Medicine, Surgery, and Midwifery.	None.
	H. C. Johnson Memorial Prize.	£10 10s.	....	Competitive Examination among Second-year Students in PRACTICAL ANATOMY.	None.
	Pollock Prize.	Interest on £372.	....	Competitive Examination among Second-year Students in PHYSIOLOGY, PHYSIOLOGICAL CHEMISTRY, and HISTOLOGY.	None.
	General Proficiency Prizes.				
	" No. 1.	£10 10s.	....	Competitive Examination among First-year Students in ELEMENTARY ANATOMY, BIOLOGY, and CHEMISTRY.	None.
	" No. 2.	£10 10s.	....	Competitive Examination among Second-year Students in ANATOMY, PHYSIOLOGY (including HISTOLOGY), and PHYSIOLOGICAL CHEMISTRY.	
	" No. 3.	£10 10s.	....	Competitive Examination among Third-year Students in the PRINCIPLES and PRACTICE OF MEDICINE and SURGERY, PATHOLOGY, MIDWIFERY, and MATERIA MEDICA.	None.
GUY'S HOSPITAL..	Entrance Scholarships. No. 1.	£105.	....	Open Competitive Examination among Candidates under twenty years of age in LATIN, GREEK, FRENCH, GERMAN, ARITHMETIC, EUCLID, and ALGEBRA.	Course at Guy's Hospital.
	" No. 2.	£52 10s.	....	Under twenty-five years of age, ditto.	Ditto.
	" No. 3.	£131 5s.	....	Open Competitive Examination among Candidates under twenty-five years of age in INORGANIC CHEMISTRY, GENERAL BIOLOGY, and EXPERIMENTAL PHYSICS.	Perpetual Course at Guy's Hospital.
	" No. 4.	£52 10s.	....	Ditto.	Course at Guy's Hospital.
	Arthur Durham Prizes.	£5.	....	Dissections by First-year Students.	
	First Year's Prizes.	£15.	....	Dissections by Students of later years.	
		£50.	....	Competitive Examination among First-year Students in ANATOMY OF BONES, LIGAMENTS, and MUSCLES, PHYSIOLOGY, and CHEMISTRY.	None.
	Second Year's Prizes.	£25.	....	Ditto.	Ditto.
		£25.	....	Competitive Examination among Second-year Students in ANATOMY, PHYSIOLOGY, and MATERIA MEDICA.	
	Michael Harris Prize.	£10.	....	Ditto.	Ditto.
	£10.	....	Competitive Examination among Second-year Students in HUMAN ANATOMY.	Ditto.	
Sands Cox Scholarship.	£15 per annum.	3 years.	Competitive Examination among Second-year Students in PHYSIOLOGY, HISTOLOGY, and PHYSIOLOGICAL CHEMISTRY.	Course at Guy's Hospital.	

SCHOLARSHIPS GIVEN IN AID OF MEDICAL STUDY—*continued.*

INSTITUTION.	TITLE OF SCHOLARSHIP &c.	ANNUAL OR TOTAL VALUE.	HOW LONG TENABLE.	HOW OBTAINABLE.	CONDITIONS ATTACHED TO TENURE.
GUY'S HOSPITAL— <i>continued.</i>	Third Year's Prizes.	£25.	....	Competitive Examination among Third-year Students in ANATOMY (Medical and Surgical), DIAGNOSIS, OPERATIVE and MINOR SURGERY, MIDWIFERY, and THERAPEUTICS.	None.
	Fourth Year's Prizes.	£10. £25.	....	Ditto. Competitive Examination among Fourth-year Students in MEDICINE SURGERY, DISEASES OF WOMEN, and MEDICAL JURISPRUDENCE.	Ditto. None.
	Golding Bird Prize.	£10. £20 and Medal.	....	Ditto. Competitive Examination among Fourth-year Students in DIAGNOSIS ORIGINAL REPORTS on Three Medical and Three Surgical Cases.	Ditto. Ditto.
	Gurney Hoare Prize.	£25.	....	Competitive Examination among Students in PATHOLOGY.	None.
	Beaney Prize for Pathology.	£31 10s.	....	Competitive Examination among Students in MATERIA MEDICA.	Ditto.
	Beaney Prize for Mater. Medica.	£31 10s.	....	Competitive Examination among Students in MATERIA MEDICA.	Ditto.
	Gull Studentship.	£150 per annum.	3 years.	For Research in PATHOLOGY and allied subjects. Not awarded by Competitive Examination.	Study at Guy's Hospital.
KING'S COLLEGE .. ..	Warnford Scholarships. No. 1.	£25 per annum.	3 years.	Competitive Examination among Matriculated Medical Students in DIVINITY, ENGLISH, HISTORY, LATIN, GREEK, FRENCH, GERMAN, and MATHEMATICS.	Perpetual Course at King's College.
	" No. 2.	£25 per annum.	3 years.	Ditto.	Ditto.
	" No. 3.	£25 per annum.	2 years.	Ditto.	Ditto.
	" Class II.	£25 per annum.	2 years.	Competitive Examination among Matriculated Medical Students in the third year, residing in the College.	Course either as Science or Medical Student at King's College
	Sambrooke Exhibitions. No. 1.	£60.	....	Competitive Examination among Matriculated Students in MATHEMATICS, ELEMENTARY PHYSICS, INORGANIC CHEMISTRY, BOTANY, and ZOOLOGY.	Ditto.
	" No. 2.	£40. £20.	....	Ditto. Competitive Examination among Matriculated Students in Science.	Ditto. None.
	Rabbeth Scholarship.	£20.	....	Competitive Examination among Matriculated Students in Science.	None.
	Science Exhibitions. No. 1.	£30 per annum.	2 years.	Competitive Examination among Candidates under nineteen years of age in MATHEMATICS, MECHANICS, PHYSICS, &c., or alternative Subjects.	None.
	" No. 2.	£20 per annum.	2 years.	Ditto.	None.
	Medical Scholarships. No. 1.	£40 per annum.	2 years.	Competitive Examination among Third- and Fourth-year Students.	
	" No. 2.	£30 per annum.	1 year.	Competitive Examination among Second- and Third-year Students.	
	" No. 3.	£20 per annum.	1 year.	Competitive Examination among First-year Medical Students.	
	" No. 4.	£20 per annum.	1 year.	Ditto.	
	" No. 5.	£20 per annum.	1 year.	Ditto.	
	Sambrooke Registrarship. No. 1.	£50.	2 years.	Competitive Examination among Matriculated Medical Students who have filled certain appointments at hospitals.	
" No. 2.	£50.	....	Ditto.		
Daniel Scholarship.	£20 per annum.	2 years.	Open Competitive Examination among six months' Laboratory Students.		
Carter Prize.	£15.	....	Open Competitive Examination in Botany.		
Tanner Prize.	£10.	....	Competitive Examination in OBSTETRICS AND DISEASES OF WOMEN AND CHILDREN.	None.	
Todd Prize.	£1 4s. and medal.	....	Competitive Examination in Clinical Medicine.		
LONDON HOSPITAL .. ..	Price Scholarships.	Interest on £5000 to be awarded in Entrance Scholarships.	....	....	
	Entrance Scholarships. No. 1.	£75.	....	Competitive Examination among Students in subjects of Preliminary Scientific M.B. Examination at University of London.	
	" No. 2.	£50.	....	Ditto.	
	Epsom College Scholarship.	Free Education.	....	....	
	Buxton Scholarships. No. 1.	£30.	....	Competitive Examination among Students in subjects of Preliminary Examination.	
	" No. 2.	£20.	....	Ditto.	
	Scholarship.	£20.	....	Competitive Examination in CLINICAL MEDICINE.	
	"	£20.	....	Competitive Examination in CLINICAL SURGERY.	
	Sutton Prize in Pathology.	£20.	....	....	
	Biennially: Duckworth Nelson Prize.	£20.	....	Competitive Examination in CLINICAL OBSTETRICS.	
Lethby Prize.	£10. £30.	....	.... Competitive Examination in PRACTICAL MEDICINE and SURGERY. Competitive Examination in CHEMISTRY.

	Entrance Scholarship.	£63.	....	Competitive Examination among Medical Students in Subjects of GENERAL EDUCATION.	
	Infirmary Scholarship.	£42.	....	Ditto.	
	Hardwick Prize.	£10.	....	Class Work of Third-year Students.	
	McGill Prize.	£10.	....	Competitive Examination among Medical Students who have passed Preliminary Scientific Examination at London or Victoria University.	
UNIVERSITY COLLEGE, LIVERPOOL.	Thorp Prizes.	£10 and £5.	....	Competitive Examination among Students who have passed one of the Preliminary Examinations.	
	Holt Tutorial Scholarships (two annually).	£100.	....	Competitive Examination among Clinical Clerk Students of two years' standing in CLINICAL MEDICINE.	
	Lyon Jones Scholarship. No. 1.	£21 per annum.	2 years.	Competitive Examination among advanced Surgical Students.	
	" No. 2.	£21.	....	Examinations in Forensic Medicine and Hygiene.	
	Derby Exhibition.	£15.	....	Vote of Faculty to Student of not less than two years' standing.	

## PUBLIC HEALTH.

INSTRUCTION FOR DIPLOMAS IN  
STATE MEDICINE.

## ENGLAND.

THE following recommendations, designed with a view of ensuring "the possession of a distinctively high proficiency, scientific and practical, in all the branches of study which concern the public health," were adopted by the General Medical Council in 1889. The regulations require that—

"(1) A period of not less than twelve months shall elapse between the attainment of a first registrable qualification in Medicine, Surgery and Midwifery and the examination for a diploma in Sanitary Science, Public Health, or State Medicine; (2) every candidate shall have produced evidence of having attended, after obtaining a registrable qualification, during a period of six months, practical instruction in a laboratory approved of by the body granting the qualification; (3) every candidate shall have produced evidence of having for six months practically studied the duties of out-door sanitary work under the medical officer of health of a county or large urban district; (4) the examination shall have been conducted by examiners specially qualified, and shall comprise laboratory work as well as written and oral examination; (5) the rules as to study shall not apply to—(a) medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890; (b) registered medical practitioners who have for a period of three years held the position of medical officer of health to any county, or to any urban district of more than 20,000 inhabitants, or to any entire rural sanitary district."

*London University.*—Sanitary Science is included in the M.D. degree, and a certificate will have to be produced showing that a course of practical instruction has been attended for the prescribed period, and that the course has included such chemical, microscopical and meteorological work and exercises as more especially relate to sanitation.

*Cambridge University.*—The Examination consists of two parts. Part I. comprises physics and chemistry; the principles of chemistry and methods of analysis, with especial reference to analyses of air and water; application of the microscope; the laws of heat and the principles of pneumatics, hydrostatics and hydraulics, with especial reference to ventilation, water-supply, drainage; construction of dwellings, disposal of sewage and refuse, and sanitary engineering in general; statistical methods. Part II. comprises laws of the realm relating to public health; origin, propagation, pathology and prevention of epidemic and infectious diseases; effects of overcrowding, vitiated air, impure water, and bad or insufficient food; unhealthy occupations and the diseases to which they give rise; water-supply and drainage in reference to health; distribution of diseases within the United Kingdom, and effects of soil, season, and climate. The examination in both parts is oral and practical, as well as in writing. Candidates may present themselves for either part separately or for both together. Every candidate must pay a fee of £4 4s. before admission to each part of the examination. Candidates for examination must be in their twenty-fourth year at the time of taking the first part and must have completed that age before presenting themselves for the second part. Those who have become qualified after January 1st, 1890, must have passed a prescribed course of study, particulars of which may be obtained on application to Dr. Bushell Annington, Barton-road, Cambridge, who is the Secretary to the State Medicine Syndicate.

*University of Oxford.*—There will be held every year in Michaelmas Term an examination in subjects bearing on Preventive Medicine and Public Health, for the purpose of granting certificates of proficiency therein. No person will be admitted thereto who shall not have obtained the degree of Bachelor of Medicine in the University. The subjects of examination are Hygiene, Sanitary Law, Sanitary Engineering and Vital Statistics. At the close of the examination a list of the candidates who shall have received certificates will be made in a book to be kept for that purpose, and will be certified by the signature of the examiners. Such book will remain in the custody of the registrar of the University. The examination is under the supervision of the Board of the Faculty of Medicine. The fee to be paid before examination is £5; for the Certificate of Proficiency, £10. This examina-

tion is suspended during alterations in the Statute. As evidence that the School of Medical Science in Oxford is a growing one, we note the progress made in the new department of Human Anatomy. The building is now nearly completed, and there is every prospect that it will be ready for occupation next summer, the present accommodation being now insufficient to meet the wants of the increasing numbers of students. In the department of Comparative Anatomy a number of large and well-lighted laboratories have been added; these have been fitted up to meet the requirements of senior students and those engaged in research.

*University of Durham.*—For the licence in Sanitary Science candidates must be registered medical practitioners, and shall have spent one year of professional study subsequently to the attainment of a first registrable qualification in Medicine, Surgery, and Midwifery, in attendance at the University of Durham College of Medicine, Newcastle-upon-Tyne. Medical practitioners registered, or entitled to be registered, on or before Jan. 1st, 1890, are exempt from this year's attendance. For the degree of Bachelor in Hygiene (B. Hy.) the candidate must be a registered medical practitioner; he must not be less than twenty-two years of age, and must have spent one year of professional study subsequently to the attainment of a first registrable qualification in Medicine, Surgery, and Midwifery, in attendance at the University of Durham College of Medicine, Newcastle-upon-Tyne, in the following manner: In the winter session, a course of lectures on Public Health; three months' practical instruction in a Chemical Laboratory; and three months' practical instruction in a Bacteriological Laboratory; and attendance on the Clinical Practice, Lectures, and Instruction at the City Hospital for Infectious Diseases, Newcastle-upon-Tyne. In the summer session a course of Lectures on Sanitary Chemistry and Physics; a course of Practical Chemistry of not less than twelve hours per week; and six months' practical study of out-door sanitary work under the Medical Officer of Health, Newcastle-upon-Tyne. The regulations for the degree of Doctor of Hygiene (D. Hy.) are as follows: The candidate shall be a Bachelor in Hygiene. He shall have been engaged for two years subsequently to the date of his acquirement of the degree of Bachelor in Hygiene in practice as a Medical Officer of Health, and shall write an essay upon some practical hygienic subject, selected by himself and approved by the Lecturer on Public Health, and shall be examined thereon, and upon questions relative to the subject of the essay. Calendars containing full information may be had on application to the Secretary.

*Victoria University.*—An examination in Sanitary Science is held yearly, beginning about the middle of July, under the following regulations: The examination is in two parts, and is written, oral and practical. Candidates before entering for either part of the examination must have held for not less than twelve months a registrable qualification in Medicine, Surgery and Midwifery, and must present satisfactory certificates of having attended courses of instruction in Public Health and in Chemistry as applied to Public Health in a college of the University, or in a college or medical school recognised for this purpose by the University; of having attended, after obtaining a registrable qualification, during at least six months, practical instruction in a laboratory approved by the University; of having practically studied the duties of out-door sanitary work for not less than six months under the Medical Officer of Health of a county or of a large urban district. Candidates may present themselves for Parts I. and II. separately or at the same time, provided that no candidate be admitted to Part II. unless he has already presented himself for Part I. No candidate's name will be published until he has satisfied the examiners in both parts of the examination. Notice in writing must be given by each candidate to the registrar of the University on or before July 1st in each year. The fee for each part is £4 4s., and must be paid on or before July 5th in each year. For any subsequent examination in the same part the fee will be £2 2s. Every candidate who has passed both parts of the examination to the satisfaction of the examiners, and who is legally registered, will receive a diploma in Sanitary Science. The examinations will begin on the third Monday in July each year.

*Royal College of Physicians of London and the Royal College of Surgeons of England.*—The following are the regulations for obtaining the diploma in Public Health: Section 1: Candidates must be registered under the Medical Act. The examination consists of two parts. The fee for

each part is £5 5s. A candidate intending to present himself must give fourteen days' written notice to the Secretary, at the Examination Hall, Thames Embankment, W.C. A candidate registered under the Medical Act on or before Jan. 1st, 1890, will be admissible to Part I. of the examination on producing evidence of being at least twenty-three years of age, and to Part II. on producing evidence of being at least twenty-four years of age. A candidate registered under the Medical Act after Jan. 1st, 1890, will be admissible to examination in Part I. on producing evidence (1) of having been in possession of a registrable qualification in Medicine, Surgery and Midwifery for at least twelve months; (2) of having attended, after obtaining such registrable qualification, practical instruction in a laboratory recognised by the Examining Board in England during a period of six months; (3) of being at least twenty-three years of age. A candidate will be admitted to Part II. of the examination on producing evidence (1) of having, during a period of six months after obtaining a registrable qualification, either practically studied the duties of out-door Sanitary Work under the medical officer of health of a county or large urban district or else held appointment as medical officer of health under conditions not requiring the possession of a special Sanitary diploma; (2) of being at least twenty-four years of age.

*King's College, London.*—A course of lectures will be given in the summer session by Professor Charles Kelly, M.D., F.R.C.P. Practical instruction will be given in the uses of Sanitary Appliances at the Parkes' Museum, Margaret-street, Regent-street, W. The lectures will be given during the summer session on Thursdays at 12.30 P.M., commencing Thursday, May 12th, 1892. Fee for the course, £2 2s., payable in advance in the College Office. Medical students at King's College, free. The necessary Laboratory Instruction to comply with the regulations of the various Universities and other Medical Licensing Bodies will be given by Professor William R. Smith, M.D., D.Sc., and Professor Edgar M. Crookshank, M.B. Lond. The syllabus includes Physics, Chemistry, Microscopy; Parasites and other Organisms Infesting Food-stuff or the Human Body; Bacteriology, including the Cultivation and Recognition of Micro-organisms. The course will last six months, four months of which will be spent in the Laboratories of Public Health, and two months in the Bacteriological Laboratory. Fee 20 guineas, payable in advance in the College Office. Under the direction of Professor William R. Smith, M.D., D.Sc., and Demonstrator, G. N. Huntly, Assoc. R.C.Sc. Lond., practical instruction will be given in the laboratories in the methods of Analysis of Air, Water, Foods &c.; Detection of Poisons. Fees, one month, £4 4s.; three months, £10 10s. The laboratories are also available for original investigations and practical work in Public Health, and are open daily from 9 A.M. to 4 P.M. and on Saturdays to 1 P.M. In Public Health special classes will be held during the winter session by Professor W. R. Smith; fee £12 12s. The bacteriological laboratory is open for original research under the direction of the professor of Comparative Pathology and Bacteriology. For one month for original research, 3 guineas. For a longer period by arrangement. For one month for private study, with supervision, 4 guineas. For a longer period by arrangement. Practical course for a month, with attendance on lectures, 5 guineas. For a year, 30 guineas. Professor H. G. Seeley, F.R.S., will deliver a course of six lectures on Physiography. For further particulars connected with any of the foregoing classes apply to Professor W. R. Smith, King's College, London.

*University College, Bristol.*—A course of lectures on the Principles and Practice of Hygiene will be given at the Medical School, Bristol, by D. S. Davies, M.B. Lond., D.P.H. Cantab., on Mondays and Fridays, 10-11 A.M., commencing on the first Monday in October. A six months' course of Practical Laboratory Instruction is to be given at the Western Counties' Laboratory, Park-street, by Mr. F. Wallis Stoddart, commencing on the first Wednesday in October, and including the subjects of Chemistry, Physics, Bacteriology and Parasites. Demonstrations on the provisions and practical working of the various Acts relating to Public Health and on the Orders, Circulars and By-laws of the Local Government Board will be delivered by Mr. J. C. Heaven on Mondays and Fridays, commencing on the first Monday in October. Gentlemen taking out the course will be admitted to practical out-door sanitary work during the session, under the supervision of the Medical Officer of Health for the city and port of Bristol. They will be considered as pupil assistants, and will be required to carry out diligently such of the duties of

medical officers of health as they may be directed to undertake. Facilities will be afforded during the course for the study of those diseases of the lower animals which are communicable to man. Fee for the entire course, 20 guineas.

## SCOTLAND.

*Edinburgh University.*—Two degrees in Science in the Department of Public Health are conferred by the University of Edinburgh—viz., Bachelor of Science (B.Sc.) and Doctor of Science (D.Sc.). Every candidate who desires to proceed to the first examination for the degree of B.Sc. must produce evidence that he has taken a degree in Medicine in the University of Edinburgh or in a University recognised under Section 1 hereof; and that he has worked for at least six months, or the usual winter session, in a laboratory where practical instruction is given in the methods of investigating subjects pertaining to Public Health. Laboratories are not recognised in which provision is not made for the teaching of Public Health laboratory in accordance with the schedule of laboratory work issued by the Senate, nor will they be recognised if such work is not taught by a specially recognised teacher. Candidates will not be admitted to the Second Examination for the said degree until one year after taking a degree in Medicine, nor until an interval of at least three months has elapsed after passing the First Examination. Two laboratories are entirely devoted to Public Health work, and the demonstrator teaches in them from 10 A.M. to 4 P.M. daily. The teaching is both individual and by lectures to groups of students. The latter are given twice a week, and deal with the *rationale* of the methods employed in the practical work.

Bachelors of Science in the department of Public Health, may, after the lapse of one year, proceed to the degree of Doctor in the same department, on producing evidence that they have been engaged in Practical Sanitation since they took the said degree of Bachelor of Science, and on presenting a Thesis on some subject in the department of Public Health. For the First Examination for the degree of Bachelor the fee is £5 5s., and for the Second Examination £5 5s.; for the degree of Doctor, £5 5s.; fee for registration as a member of the University Council (unless previously registered), £1.

*Glasgow University.*—The following regulations as to instruction in Public Health and as to examinations for the diploma in Public Health prepared by the Senate have received the sanction of the University Court; the University provides instruction in Public Health by a laboratory training; and otherwise. The subjects of instruction are:—Duties of health officer, air and ventilation, food and its adulterations, water and water-supply, sewerage and drainage; construction of hospitals, public buildings and dwellings; overcrowding; manufactories, insalubrious trades, cemeteries, nuisances, quarantine, disinfectants and deodorisers, outbreaks of zymotic diseases; climate, topographical and seasonal; its influences in relation to health and disease; geographical distribution of diseases; knowledge of leading Sanitary Acts of Parliament; vital statistics. The laboratory training is provided in a special department of the Chemical Laboratory. Practical instruction is given in the subjects of water, air, soils, antiseptics and disinfectants, foods. The diploma in Public Health may be obtained by any Bachelor of Medicine of the University on his passing the required examination not less than twelve months after he has taken the degree of M.B. Every candidate for a diploma in Public Health shall give sufficient evidence by certificates: that after obtaining the degree of M.B. he has undergone the practical training provided above, and that he has, after obtaining such degree, practically studied for six months the duties of out-door sanitary work under the Medical Officer of Health of a county or large urban district. The examination is written, practical and oral. The fee for the course of instruction is £10 10s. and for the examination £5 5s.

*University of Aberdeen.*—The diploma in Public Health (D.P.H.) is conferred only on graduates in Medicine of a University in the United Kingdom; and a period of not less than twelve months must elapse between medical graduation and entrance to the examination for the diploma. Every candidate must produce evidence of having attended, after graduation in Medicine, during a period of six months, practical instruction in Hygiene in a laboratory approved of by the University, together with having for a like period after graduation practically and daily studied the duties of out-door sanitary work under the Medical Officer of Health of a county or large urban district, or also of having himself

held appointment as Medical Officer of Health. He must also have regularly attended for six months the wards of a general fever hospital containing not less than fifty beds. Every candidate who is not a graduate in Medicine of this University must have attended a course of instruction in the University in one or more of the subjects embraced in the examination for the diploma. The diploma is conferred after an examination in Public Health held in March and July of each year. Candidates desiring to appear for examination at either of these periods must send in their names, with the necessary fee, to the Secretary of the Medical Faculty before the first day of the month in which the examination takes place. The fee for the examination is £5 5s. The examination is conducted by specially qualified examiners appointed by the University. Candidates may enter for the whole examination at one period, or they may enter for Parts I. and II. at one period and for Parts III. and IV. at another and subsequent period.

*Royal College of Surgeons, Edinburgh.*—Every candidate for the examination for the diploma in Public Health must be a registered medical practitioner of at least one year's standing; or be in possession for at least one year of such colonial, Indian, or foreign qualification registrable in terms of the Medical Act, 1886, as may be specially recognised by the College. Attendance of candidates on special courses of lectures and instructions is recommended by the College on all subjects appertaining to the examination for the diploma. But it is imperative on every candidate, after obtaining a registrable qualification, to attend six months' practical instruction in a sanitary science laboratory approved by the College. Every candidate will be required to produce evidence of having for six months practically studied out-door sanitary work under the Medical Officer of Health of a county or large urban district. The rules as to study will not apply to medical practitioners registered on or before Jan. 1st, 1890, nor to registered practitioners who have for a period of three years held the position of Medical Officer of Health to any county or to any urban district of more than 20,000 inhabitants, or to any entire rural sanitary district. The examination consists of a First and Second Examination, and in both cases comprises laboratory work as well as written and oral examinations. The fee for the diploma is £10, of which £5 is payable on entering for the First Examination and £5 on entering for the Second Examination. Candidates may present themselves for both examinations at one period, the condition being that failure to pass in the subjects of the First Examination precludes the candidate from admission to the Second Examination. Every candidate on passing the Second Examination will receive a diploma for Proficiency in Sanitary Science, Public Health and State Medicine, which is registrable on the Medical Register as an additional qualification. NOTE.—This diploma will be superseded after Oct. 1st, 1892, by one to be granted by the Triple Qualification Board, but candidates who have passed the First Examination for the above diploma before that date may be admitted to the Second Examination at a subsequent period.

*Faculty of Physicians and Surgeons of Glasgow.*—After Sept. 30th, 1892, the separate Examinations conducted by the Royal Colleges of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow, and the three Bodies will conduct their Examinations for the diploma in Public Health conjointly. Candidates other than those registered before 1890 must produce evidence of having subsequently to registration (1) attended six months in a Public Health Laboratory; (2) practically studied for six months the duties of out-door Sanitary work under the Medical Officer of Health of a county or large urban district. The examination is divided into two parts, the first part embracing Chemistry, with laboratory work, physics, and meteorology; the second part epidemiology, endemiology, vital statistics, practical sanitation and sanitary law. The various subjects included in the two examinations are detailed by synopses; and the Acts of Parliament embraced in "Sanitary Law" are also enumerated in a schedule. Candidates may present themselves for both examinations at one period, or for either examination separately. The fee is 10 guineas, one-half payable for each part; on re-entry candidates pay 3 guineas in respect of such part. The examination is held twice yearly in Edinburgh or in Glasgow. Applications for admission in Edinburgh should be made to Mr. James Robertson, solicitor, 1, George-square, Edinburgh; and in Glasgow to Mr. Alexander Duncan, B.A., 242, St. Vincent-street. Either of these gentlemen will furnish candidates with copies of the regulations, and any information necessary.

## IRELAND.

*Royal University of Ireland.*—This University grants a diploma in Sanitary Science. It is conferred only on graduates in Medicine of the University. Candidates are not admitted to this examination until the lapse of twelve months from the time of obtaining the first registrable qualification; they must give notice in writing to the Secretaries of their intention to present themselves and must pay the fee, £2, at least one month previously to the examination. Candidates are required to produce a certificate of having attended a course of instruction in Geology in some recognised institution, as a guarantee that they have rigorously studied the subject; they must also produce a certificate of having, after obtaining a registrable qualification, attended six months' practical instruction in a laboratory approved by the University.

*University of Dublin.*—The diploma in State Medicine is conferred, after examination, on the following conditions:—The candidate must be a Doctor in Medicine, a graduate in Medicine and Surgery of Dublin, Oxford or Cambridge. The name of the candidate must have been on the Medical Register at least twelve months before the examination. The candidate must have completed, subsequently to registration, six months' practical instruction in a laboratory approved by the University and also have studied practically out-door sanitary work for six months, under an approved officer of health. The subjects of examination will be—(a) State Medicine and Hygiene, including causation and prevention of disease, contagion in different diseases, morbid diathesis, congenital diseases and malformations, diseases of animals in relation to the health of man, diseases of the vegetable kingdom, famine diseases, causes of origin and spread of epidemics, principles of bacteriology, quarantine, disinfection &c.; (b) Chemistry, including air, water and articles of food and drink, and their chemical and microscopical examination and analysis, the detection of common poisons and recognition of injurious pigments &c.; (c) Physics and Meteorology; (d) Engineering; (e) Morbid Anatomy; (f) Vital Statistics; (g) Medical Jurisprudence.

*Royal College of Physicians and Royal College of Surgeons.*—Stated examinations for the diploma in State Medicine are held on the Tuesday, Wednesday and Thursday following the first Friday of the months of February, May and November. A special examination for the diploma can be obtained on payment of £5 5s., in addition to the ordinary fees mentioned below, and on giving notice at least one fortnight before the date of the proposed examination. Every candidate for the diploma in State Medicine must be a registered medical practitioner. He must return his name to the secretary of the committee of management under the conjoint scheme three weeks before the examination, and lodge with him a testimonial of character from a Fellow of either of the Colleges, or of the Royal Colleges of Physicians or Surgeons of London or Edinburgh. The fee for the examination is £10 10s. The examination for the diploma in State Medicine comprises the following subjects:—State Medicine and Hygiene, Chemistry, Meteorology and Climatology, Engineering, Morbid Anatomy, Vital Statistics, Medical Jurisprudence, Law.

## DENTAL SURGERY.

ANYONE who is on the Medical Register is entitled to practise as a dentist, although he cannot register as such without the special licence; but it is of eminent advantage to take the L.D.S., otherwise few dental appointments at general or special hospitals or dispensaries are available, and what is still more important, the manual dexterity and knowledge of mechanics requisite for the successful practice of dentistry can only be gained by long and careful training at the dental operating chair and in the dental laboratory; and this having been attained, it costs but little trouble to pass the special examination. The subjects beyond those included in the general qualification are—Dental Anatomy and Physiology (Human and Comparative), two courses; Dental Surgery, two courses; Dental Mechanics, two courses; Metallurgy, one course; Practice of Dental Surgery at a recognised school, two years, and an apprenticeship in Dental Mechanics to a competent practitioner for three years, but in the case of qualified surgeons two will suffice. The Dental Schools in London are the Dental Hospital of London, the National Dental Hospital and College and Guy's Hospital Dental School, and most of the large provincial towns have

now dental hospitals. A convenient arrangement by which the M.R.C.S., L.R.C.P. and L.D.S. can be taken is as follows:—The Preliminary Examination in General Education having been passed, the student should become apprenticed to a qualified dentist and register as a dental and medical student. (This instruction, however, may be taken prior to the date of registration as a dental student.) During his apprenticeship the student should receive instruction in Chemistry, including Chemical Physics, Practical Chemistry, Pharmacy and Materia Medica, and pass in these subjects before entering the hospital. Having entered the hospital, the student should attend the dental and general courses contemporaneously, and pass the Elementary Anatomy Examination at the end of the first winter session, and at the end of the second winter the Second Conjoint Examination in Anatomy and Physiology. At this point a break may be made to admit of the completion of the dental curriculum and the passing of the final examination for the L.D.S. diploma. The student should now devote the rest of his time to the requirements of the Conjoint Board. The regulations for the Dental Licence of the Royal Colleges of Ireland and Edinburgh and of the Faculty of Physicians and Surgeons of Glasgow are very similar to those of the English College. The L.D.S. can also be obtained alone.

#### REGISTRATION OF DENTAL STUDENTS.

The registration of dental students is carried on at the Medical Council Office in London in the same manner as the existing registration of medical students, and subject to the same regulations as regards Preliminary Examinations. Students who commenced their professional education by apprenticeship to dentists entitled to be registered, or by attendance upon professional lectures before July 22nd, 1878 (when dental education became compulsory), are not required to produce evidence of having passed a Preliminary Examination. Candidates for a diploma in Dental Surgery must produce certificates of having been engaged during four years in professional studies, and of having received three years' instruction in Mechanical Dentistry from a registered practitioner. One year's *bond-fide* apprenticeship with a registered dental practitioner, after being registered as a dental student, may be counted as of the four years of professional study. The three years of instruction in Mechanical Dentistry, or any part of them, may be taken by the dental student either before or after his registration as a student; but no year of such mechanical instruction will be counted as one of the four years of professional study unless taken after registration.

The Royal College of Surgeons of England grants a diploma in Dental Surgery under the following regulations: A candidate must produce certificates: 1. Of registration as a dental student by the General Medical Council, 299, Oxford-street, London, W. 2. Of having been engaged during four years in the acquirement of professional knowledge subsequently to the date of such registration. 3. Of having received instruction in Chemistry, including Chemical Physics, Practical Chemistry and Materia Medica. 4. Of having attended a recognised medical school where he followed (a) a course of lectures on Anatomy during not less than six months, or one winter session; (b) a course of lectures on Physiology during not less than six months, or one winter session; (c) a separate practical course of Physiology during not less than three months; (d) a course of lectures on Surgery during not less than six months, or one winter session; (e) a course of lectures on Medicine during not less than six months, or one winter session. (Students are required to attend examinations, which are held in the several classes.) 5. Of having performed dissections at a recognised school during not less than twelve months. 6. Of having attended at a recognised hospital or at hospitals in the United Kingdom the practice of Surgery and clinical lectures on Surgery during two winter sessions. 7. Of having attended at a recognised school two courses of lectures upon each of the following subjects: Dental Anatomy and Physiology (Human and Comparative), Dental Surgery, Dental Mechanics and one course of lectures on Metallurgy, by lecturers recognised by this College. Students are required to attend examinations which are held in the several classes. 8. Of having been engaged during a period of not less than three years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a competent practitioner. In the cases of qualified surgeons evidence of a period of not less than two instead of three years of such instruction will be sufficient. This instruction may be taken prior to the date of registration as a dental student. 9. Of

having attended at a recognised dental hospital, or in the dental department of a recognised general hospital, the practice of Dental Surgery during the period of two years. 10. Of being twenty-one years of age. (Professional study prior to the date of registration as a dental student is not recognised except in the case of Chemistry, Practical Chemistry and Materia Medica, and of instruction in the details of Mechanical Dentistry—see Clauses 3 and 8). All candidates who commenced their professional education on or after July 22nd, 1878, must, in addition to the certificates enumerated above, produce a certificate of having, prior to such commencement, been registered as dental students by the General Medical Council. Candidates who are members of the College, or who have passed the examination in Surgery of the Examining Board in England, or who shall produce evidence of having passed the examination in Surgery for the licence of the Royal College of Surgeons of Edinburgh, the Royal College of Surgeons in Ireland, or the Faculty of Physicians and Surgeons of Glasgow, or an examination in Surgery for a degree in Medicine or Surgery at a University in the United Kingdom, will be exempt from re-examination in General Surgery and Pathology. A candidate whose qualifications are found insufficient will be referred back to his studies, and will not be admitted to re-examination within the period of six months unless the Board shall otherwise determine. The fee for the diploma is £10 10s., not inclusive of any stamp duty.

*Royal College of Surgeons, Edinburgh.*—For the licence in Dental Surgery all candidates must pass a preliminary examination in general knowledge and have their names inscribed in the Register of Dental Students of the General Medical Council. A copy of regulations, giving a list of preliminary examinations recognised for obtaining this licence, as well as of the subjects of the professional examinations, may be obtained from Mr. James Robertson, Clerk to the Royal College of Surgeons, at 1, George-square, Edinburgh. Students who commenced their professional education by apprenticeship or attendance on lectures before July 22nd, 1878, are exempt from the preliminary examinations. Candidates must produce certificates of having, subsequently to the date of registration, been engaged for four years in professional studies, and of three years' instruction in Mechanical Dentistry from a registered dental practitioner, except in the case of previously registered medical practitioners, when two years will be considered sufficient. 1. Candidates who have commenced their studies prior to Oct. 1st, 1890, must have attended the following curriculum: Anatomy, one winter course; Practical Anatomy and Demonstrations, nine months; Practical Anatomy, nine months; Anatomy of Head and Neck, one course of twenty lectures; Physiology, one course of not less than fifty lectures; Chemistry, one winter course; Surgery, one winter course; Medicine, one winter course; Materia Medica, one course of three months; Practical Chemistry and Metallurgy, one course of three months; attendance on the practice of Surgery and Clinical Lectures on Surgery, at a recognised hospital, one course of six months, or two courses of three months. 2. Candidates commencing their studies after Oct. 1st, 1890, must have attended the following curriculum: Anatomy, one course of six months; Practical Anatomy, twelve months; Chemistry, one course of six months; Practical Chemistry, one course of three months; Physiology, one course of six months; Materia Medica, one course of three months; Surgery, one course of six months; Medicine, one course of six months; attendance on the practice of Surgery, and Clinical Lectures on Surgery, at a recognised hospital, six months. These courses must have been attended at a University, or in an established school of medicine, or in a provincial school specially recognised by the College as qualifying for the diploma in Surgery. In addition to these courses candidates will be required to have attended in a recognised dental hospital, or with teachers recognised by the College, the following special courses of lectures and instruction: Dental Anatomy and Physiology (Human and Comparative), Dental Surgery and Pathology, Dental Mechanics—one course each; two years' attendance at a dental hospital, or the dental department of a general hospital, recognised by the College. Certificates of attendance on such of these courses of the new curriculum as may be respectively required will entitle candidates to appear either for the first dental examination, or for the first and second examinations for the triple qualification as they may select, and subject to the existing regulations for each qualification. Candidates.

who have passed the first and second examinations for the triple qualification will be exempt from the first dental examination, and will have the advantage of being admissible either to the Final Dental Examination or to the Final Examination for the Triple Qualification, or to both. But the First Dental Examination will not be held as equivalent to the first and second Triple Examinations, and will admit to the Final Dental Examination only. Candidates who are Licentiates of this College, or who may be registered medical practitioners, will be required to produce certificates of attendance on the special subjects only, and will be examined in these only for the Dental diploma. First Professional Examination: The candidate must have attended the courses on Anatomy, Chemistry and Physiology. The examination embraces Anatomy, Chemistry and Physiology. The fee is £4 4s. Second Examination: The candidate must have attended the remaining courses of the curriculum, must be twenty-one years of age, and must pay a fee of £6 6s. The examination embraces Surgery, Medicine, Therapeutics and the special subjects of Dental Anatomy and Physiology, Dental Surgery and Pathology and Dental Mechanics. Unsuccessful candidates will be repaid £2 2s. in the First and £3 3s. in the Second Examinations. Candidates who claim exemption from the First Dental Examination, on the ground of having passed the First and Second Triple Qualification Examination, will, before being admitted to the Second Dental Examination, be required to pay the total fee of £10 10s., payable for the Dental diploma, of which £3 3s. will be returned in case of rejection.

*Faculty of Physicians and Surgeons of Glasgow.*—The regulations as to certificates, curriculum, number and subjects of examinations, fees &c. are in effect similar to those of the Royal College of Surgeons of Edinburgh. Special provision is made for candidates who intend to qualify both in Medicine and in Dentistry. There is an examination in Practical Dentistry conducted in a dental hospital.

*Royal College of Surgeons in Ireland.*—All information concerning the licence in Dentistry may be obtained from the Registrar of the College, who will receive the applications of candidates for permission to be examined. The bank receipt for fees, together with all certificates &c., are to be lodged at least fourteen days prior to the day fixed for the commencement of the examination for the class to which each candidate belongs. The examinations commence on the second Monday in the months of February, May and November. Candidates are required to pass three examinations—viz., Preliminary, Primary and Final. 1. Preliminary Examination and Registration. 2. Primary Dental Examination, the fee for which is £10 10s., and the subjects are: (a) Physics; (b) Chemistry; (c) Anatomy; (d) Histology and Physiology. 3. Final Examination. Candidates must produce evidence of having passed the former two examinations and of having attended courses of Dental Surgery and Pathology, Dental Mechanics, Dental Anatomy, Dental Metallurgy and Surgery; of having attended for two years the practice of a dental hospital recognised by the College, or of the dental department of a general hospital so recognised; of having, subsequently to passing the Primary Dental (or an equivalent) Examination, attended for a period of nine months as an extern, or six months as an intern, pupil the practice of a recognised medico-surgical hospital; of having been engaged for at least forty-five months in acquiring a knowledge of dentistry. The candidate is recommended to devote at least three years to acquiring a practical knowledge of Dentistry under the instruction of a registered dentist. Candidates holding a diploma in Surgery are only required to produce certificates of one year's attendance at a dental hospital and are not required to produce certificate in Dental Anatomy and Physiology. As this remission has been made on the understanding that the surgeon devotes his whole time to dental work, such attendance must be taken out after the date of his diploma in Surgery. The examination fee is £10 10s.

#### TEACHING INSTITUTIONS IN ENGLAND.

*Dental Hospital of London and School of Dental Surgery, Leicester-square.*—The school was founded to provide the special dental education required by the Royal College of Surgeons for the licence in Dental Surgery. The general part of the curriculum may be taken at any general hospital. The hospital is open from 9 A.M. to 4 P.M., there being one staff for the morning and another for the afternoon of each day. There is a good mechanical laboratory, under Mr. A. J. Watts, and opportunity is afforded students of gaining practical experience in taking models and fitting dentures into the mouth. The demonstrators at the commencement

of each session give a course of lectures on Operative Dental Surgery. The five house surgeoncies are held for six months each, and are open to all qualified students. The lecturers, in addition to their lectures, give special demonstrations on the Microscopy of Dental Anatomy and Dental Surgery. The lecturer on Dental Mechanics also gives practical demonstrations in the mechanical laboratory. A scholarship of the value of £20 has been founded by Sir Edwin Saunders and will be awarded to the student who has obtained the highest aggregate number of marks in the five class examinations—viz., the four Lecturers' Prizes, the Operating Prize—and in additional special *vivâ-vocâ* examinations in Practical Dentistry. Prizes and certificates are awarded by the lecturers for the best examinations in the subjects of their respective courses, at the end of the summer and winter sessions. Arrangements have been made for a prize in Operative Dentistry. A prize of the value of 5 guineas is given by Messrs. Ash and Sons for the best essay on some surgical subject connected with Dental Surgery. The conditions under which this prize is to be competed for are the same as those for the Saunders Scholarship, with this exception, that the papers are to be written in the hospital during the summer session. Consulting Physician: Sir Richard Quain, Bart. Consulting Surgeon: Mr. C. Heath. Consulting Dental Surgeons: Mr. T. Arnold Rogers and Sir John Tomes. Dental Surgeons: Monday, 9 A.M., Mr. C. E. Truman; Tuesday, 9 A.M., Mr. R. H. Woodhouse; Wednesday, 9 A.M., Mr. G. Gregson; Thursday, 9 A.M., Mr. Storer Bennett; Friday, 9 A.M., Mr. W. Hern; Saturday, 9 A.M., Mr. Leonard Matheson. Assistant Dental Surgeons: Monday, 9 A.M., Mr. J. F. Colyer; Tuesday, 9 A.M., Mr. C. F. Rilot; Wednesday, 9 A.M., Mr. E. Lloyd Williams; Thursday, 9 A.M., Mr. W. B. Paterson; Friday, 9 A.M., Mr. H. Baldwin; Saturday, 9 A.M., Mr. H. Lloyd Williams. For the afternoons—Monday, Mr. A. Clayton Woodhouse; Tuesday, Mr. W. H. Dolamore; Wednesday, Mr. F. J. Bennett; Thursday, Mr. W. H. Woodruff; Friday, Mr. C. Robbins; Demonstrators of Gold and other Methods of Filling: Mr. Arthur Colyer, Mr. E. H. L. Briault, Mr. G. Hern, and Mr. E. Gardner. Medical Tutor: Mr. W. H. Dolamore. Lecturers: Dental Surgery and Pathology—Mr. Storer Bennett. Dental Anatomy and Pathology (Human and Comparative)—Mr. Arthur Underwood. Mechanical Dentistry—Mr. David Hepburn. Metallurgy in its application to Dental Purposes—Professor A. K. Huntington (King's College, London). Total fee as a perpetual student, £36 15s., to be paid in one sum. Composition fee for the Special Lectures and two years' Hospital Practice required by the curriculum, £31 10s. All fees are payable on day of entry. An extra fee of £10 10s. for Hospital Practice makes a student "perpetual" for that course when paid at any period after original entry. The Dean, Mr. Morton Smale, attends at the hospital every Wednesday morning from 10 to 12, and daily from 5 P.M. to 6 P.M. from Sept. 26th to Oct. 30th, and from April 29th to May 28th, or he can be seen by appointment. Letters to be addressed—40, Leicester-square, "to be forwarded."

*National Dental Hospital and College.*—Consulting Physicians: Dr. B. W. Richardson and Dr. W. H. Broadbent. Consulting Surgeons: Sir Spencer Wells and Mr. Christopher Heath. Consulting Dental Surgeon: Sir Edwin Saunders. Honorary Visiting Physician: Dr. James Maughan. Honorary Visiting Surgeon: Mr. E. W. Roughton. Dental Surgeons: Mr. F. H. Weiss, Mr. A. Smith, Mr. M. Davis, Mr. A. F. Canton, Mr. H. G. Read and Mr. W. R. Humby. Assistant Dental Surgeons: Mr. W. Weiss, Mr. P. H. White, Mr. S. Spokes, Mr. T. G. Read, Mr. C. W. Glassington and Mr. Rushton. Lecturers (winter), Dental Anatomy and Physiology: Mr. Sidney Spokes, Tuesdays and Thursdays, 6 P.M., in October, November and December. Operative Dental Surgery and Therapeutics: Dr. George Cunningham, Mondays, 6.30 P.M., in October, November and December. Dental Materia Medica and Therapeutics: Mr. C. W. Glassington, Tuesdays, 7.30 P.M., in October, November and December. Dental Metallurgy: Mr. W. Lapraik, Tuesdays, 7.30 P.M., in January, February and March. Dental Mechanics: Mr. H. Rose, Mondays, 7 P.M., in January, February and March. Demonstrations in Dental Mechanics: Mr. Humby, Wednesdays, 7 P.M., in January, February and March (in 1889 and alternate years). Summer—Dental Surgery and Pathology: Mr. W. Weiss, Mondays and Thursdays, 6 P.M., in May, June and July. Elements of Histology: Dr. J. Maughan, Mondays and Thursdays, 5 P.M., May, June and July. Clinical Lectures and Demonstrations are given from time to time. The stopping rooms have accommodation for

twenty chairs. Dresserships in the extraction room are held for three months by six senior and twelve junior students of the hospital. An Entrance Exhibition, of the value of £15, is open for competition at the commencement of each summer and winter session. Six prizes in medals are open for competition at the end of each course of lectures. Certificates of honour are given in each class. The Rymer Medal for General Proficiency, value £5, is awarded annually to the most meritorious student; and the Ash Prize, value £3 3s., for a Thesis on a subject in Dental Surgery. General fee for special lectures required by the curriculum of the Royal College of Surgeons of England, £12 12s. For the Two Years' Hospital Practice required, £12 12s. Total fee for the Special Lectures and Hospital Practice required, £25 4s. Perpetual fee to all Lectures and to Hospital Practice, £15 15s. each. Single Courses: Dental Anatomy and Physiology, Dental Surgery and Pathology, Operative Dental Surgery and Dental Mechanics, each, one course, £2 12s. 6d.; two courses, £4 4s.; Dental Metallurgy, one course, £3 3s.; two courses, £5 5s.; Dental Materia Medica, £2 2s.; Demonstration of Dental Mechanics, Elements of Histology, each £1 1s. Hospital Practice to registered practitioners, six months, £7 7s.; twelve months, £9 9s. Information respecting the Hospital Practice and the College may be obtained from the Dean, Mr. Harry Rose, at the Hospital, Great Portland-street.

*Guy's Hospital.*—The work of the Dental Department begins daily at 9 o'clock both in the extraction rooms and in the conservation room. *The Extraction Rooms:* Patients are admitted between 9 and 10.30 A.M., and are seen by the assistant dental surgeon for the day, the dental house surgeon, the assistant dental house surgeon, and the dressers. Such cases as are suitable for conservative treatment are transferred to the conservation room, taking with them a dental chart to indicate the treatment required. *The Conservation Room:* This room is under the charge of one of the assistant dental house surgeons from 9 o'clock till the completion of the extractions, and he receives patients transferred from the extraction rooms and allots the cases to the dressers. The assistant dental surgeons of the day demonstrate a filling or one of the operations of dental surgery every morning at 11 and 1 o'clock respectively. A ticket which gives admission to the General and Special Lectures and Demonstrations, and to the Hospital and Dental Practice, requisite for the diploma in Dental Surgery of the Royal College of Surgeons of England, may be obtained—1. By the payment of £90 on entrance. 2. By two payments of 50 guineas and 40 guineas, at the beginning of the first and second years respectively. A ticket which gives admission to the General Lectures, Demonstrations and Hospital Practice required for the L.D.S. Eng. may be obtained for £60 paid on entrance, or 60 guineas paid in instalments of 30 guineas at the beginning of the first year and 30 guineas at the beginning of the second year. A ticket which gives admission to the Special Lectures and Demonstrations and Dental Practice only may be obtained for 30 guineas paid on entrance.

*London Hospital.*—Mr. Barrett gives practical instruction during the winter session on Tuesdays at 9 A.M., and during the summer session on Tuesdays and Thursdays at the same hour. The attention of dental students is particularly directed to the fact that the Council of the Royal College of Surgeons recognises the dental department of the London Hospital as a school at which may be obtained the dental practice necessary to qualify a student for the examination for the Dental diploma. Dental students may also obtain the general medical education (apart from certain lectures to be attended at the dental school) and the dental practice necessary for the diploma at the London Hospital School. In selecting from candidates for the office of Dental Assistant priority will be given to those who have attended the greatest number of lectures on Dental Pathology and Surgery, and have also been the most punctual in attendance in the dental department on the Tuesday mornings. During the summer a class for special instruction in filling teeth will be formed by Mr. Barrett.

*Mason College, Birmingham.*—The teaching of Dentistry is undertaken by the Mason College, acting in association with the Birmingham Dental Hospital and the Birmingham Clinical Board, so that the students may fully qualify themselves for the Dental diploma of the Royal Colleges. There is a special and well-equipped Dental Museum and Laboratory. Special courses of lectures are delivered on Medical and Surgical Diseases of the Mouth &c., and there is a special course of Practical Dental Histology. An Entrance Exhibition, value £15, is awarded annually at the commencement of the winter

session. Medals and honour certificates are awarded annually in the various classes.

*Liverpool Dental Hospital, Mount Pleasant.*—The Liverpool Dental Hospital, founded in the year 1864, combines the work of a most useful charity with all the advantages of a dental school recognised by all the licensing bodies of Great Britain and Ireland. The hospital has four separate operating rooms, all facing north, which is recognised as the best aspect for securing a good light. There is an abundant daily supply of patients. Over 21,000 cases were treated during last year. The hospital staff consists of twelve honorary dental surgeons, one of whom is present each morning and evening. In addition to these there are one or more house surgeons to superintend all the hospital work and devote themselves to clinical teaching, advising and helping the students in their studies. Every facility is afforded to students who are anxious to acquire proficiency in Dental Surgery and to prepare themselves for the Dental diploma of the Royal College of Surgeons. The fee for the two years' Dental Hospital Practice required by the College of Surgeons is £12 12s., which must be paid on entrance. Fee as a perpetual student, £15 15s. Composition fee for all Lectures: A payment of £50 on entrance, or in two equal instalments (one half on entrance and the remainder within twelve months). Fee for General Hospital Practice, £10 10s. All communications relating to the medical department should be addressed to Mr. Paul, the Dean of the Medical Faculty, 38, Rodney-street; and all communications relating to the Dental Hospital should be addressed to R. Edwards, 50, Mount Pleasant.

*Bristol General Hospital.*—Mr. Genge gives practical instruction in Dental Surgery at 9.30 A.M. on Mondays and Thursdays. Assistant House Surgeon, Mr. P. Star.

*Owens College, Manchester.*—Arrangements have been made for dental students to attend the hospital practice at the Manchester Royal Infirmary and the practice at the Victoria Dental Hospital. Lectures on special subjects will be given in the College as follows:—Winter session: Dental Mechanics, Mr. Tanner, Thursday, 4 P.M. Summer session: Dental Anatomy and Physiology, Mr. Hooton, Tuesday at 4 P.M., Friday at 2 P.M. Dental Surgery, Mr. Campion, Tuesday and Friday, 3 P.M. Operative Dentistry, Wednesday: Lecture, 2.30 P.M.; Demonstration, 4 P.M. Dental Metallurgy, Dr. Burghardt, Monday, 2.30 P.M. Demonstrations in Dental Pathology and Histology, Mr. Headridge. For the course of Metallurgy the fee is £3 3s.; for other lectures, one course, £3 3s.; two courses, £4 4s. Dental practice for two years at the Manchester Royal Infirmary, £12 12s., paid in advance, or £8 8s. for the first year and £5 5s. for the second year. At the Victoria Dental Hospital patients attend at 8.30 in the morning daily, and at 7 P.M. on Monday, Wednesday and Friday. Consulting Physicians: Dr. H. Simpson and Dr. D. J. Leech. Consulting Surgeons: Mr. E. Lund, Mr. F. A. Heath, Mr. T. Jones and Mr. J. Hardie. Consulting Dental Surgeons: Mr. H. Campion and Mr. G. W. Smith. Dental Surgeons: Mr. G. G. Campion, Mr. E. P. Collett, Mr. W. Dougan, Mr. L. Dreschfeld, Mr. J. W. Dunkerley, Mr. W. Dykes, Mr. W. Headridge, Mr. W. A. Hooton, Mr. I. Renshaw, Mr. W. Simms, Mr. W. Smithard, Mr. T. Tanner and Mr. G. O. Whittaker. Assistant Dental Surgeons: Mr. P. A. Linnell, Mr. F. W. Minshall, Mr. C. R. Morley, and Mr. C. H. Smale. Dean: Mr. G. G. Campion.

*Devon and Exeter Dental Hospital, Castle-street, Exeter.*—Established 1880.—The hospital is open daily (Sundays excepted), and patients are admitted between the hours of 9 and 11 A.M. Students attending the practice of the hospital must consider themselves strictly under the control of the medical officers, and must not undertake any operation without the consent of the dental surgeon for the day.

#### SCOTLAND.

*The Incorporated Edinburgh Dental Hospital and School, 5, Leveston-lane, Edinburgh.*—For the special classes, both theoretical and practical, required by dental students, the directors have secured the services of an efficient staff of dental officers and lecturers. There will also be a course of demonstrations in Mechanical Dentistry. Students will receive instruction in Practical Dental Mechanics under the mechanician. The fee for clinics in gold filling is included in the Dental Hospital fee of £15 15s. The minimum cost of classes for the whole course of dental instruction amounts to £78 13s. Consulting Physician: Dr. Alex. Peddie. Consulting Surgeon: Mr. Joseph Bell. Consulting Surgeon-

Dentist : Dr. John Smith. Dental Surgeons : Messrs. W. Bowman Macleod, Andrew Wilson, Malcolm Macgregor, George W. Watson, J. S. Durward, James Mackintosh and W. Forrester. Assistant Dental Surgeons : Messrs. John S. Amooore, J. Graham Munro, T. Gregory, John Turner, David Monroe and F. Page. Extra Assistants : Messrs. Sewill Simmons and R. Nasmyth Hannah. Tutorial Dental Surgeon : Mr. Frederick H. Turnbull. Dean : Mr. William Bowman Macleod, 16, George-square.

*Dental Hospital and School, Glasgow.*—The summer session was opened on Tuesday, May 1st, 1892, and the lectures are delivered as under :—Dental Surgery and Pathology, on Tuesdays and Thursdays, at 8 A.M. Mr. Rees Price, lecturer. Dental Anatomy and Physiology, on Wednesdays and Saturdays, at 8 A.M. Dr. Wm. Wallace, M.A., M.B., L.D.S., lecturer. The winter session opens on Nov. 6th, 1892, and the lectures will be delivered as under :—Dental Mechanics, on Tuesday evenings at 7 P.M., beginning Nov. 6th. Mr. John A. Biggs, lecturer. Fee for each of the above courses of lectures, £3 3s. The lectures on Dental Anatomy and Dental Surgery are arranged to extend over two summer sessions, as required by the English College, thus enabling students to present themselves for examination at any of the four Licensing Boards. The fees for attendance at the Dental Hospital and lectures amount in all to £25 4s., and may be paid separately, but by a payment of £15 15s. on entering, and £7 7s. at the beginning of the second year, a saving of £2 2s. is effected. Intending students before commencing to attend the lectures or hospital practice must produce evidence of having passed the preliminary examination prescribed by the regulations of the General Medical Council for registration of dental students. Dean : Mr. J. Rankin Brownlie. Secretary : D. M. Alexander, 117, Wellingtont-street, Glasgow. The hospital is open daily from 5 to 7 P.M. (Saturdays excepted); Saturdays from 9 to 11 A.M. Students may enrol at any time, their period of attendance counting from date of entry. The fee for the two years' attendance required by the curriculum is £15 15s.

*Glasgow Royal Infirmary (Dental Department).*—Mr. W. H. Gray attends at the Royal Infirmary at 3 P.M. on Mondays, Wednesdays and Saturdays, and gives a course of Dental Surgery on these days in summer. The following course in the curriculum can be taken at St. Mungo's College : Anatomy, six months; Practical Anatomy, nine months; Physiology, six months; Chemistry, six months; Practical Chemistry with Metallurgy, three months; Surgery, six months; Medicine, six months; Materia Medica, three months; Clinical Surgery, six months; Dental Surgery, six months, and attendance for two years on the dental department of the hospital. The attendance on the Dental Clinic is free to students of the hospital; to dental students, one year, £5 5s.; perpetual, £10 10s.

## PUBLIC MEDICAL SERVICES.

### THE INDIAN MEDICAL SERVICE.

IN our annual summary of the regulations for the various public medical services we have drawn attention to the rank and titles, promotion, Indian pay and allowances of officers while serving in the military department of the Indian Medical Service. The following information will, we trust, be found useful to those who are thinking of embarking on an Indian career. For the Indian Service all natural-born subjects of Her Majesty between twenty-one and twenty-eight years of age at the date of the examination, and of sound bodily health, may be candidates. No candidate is permitted to compete for a commission more than twice. Candidates may be married or unmarried. They must possess a diploma entitling them under the Medical Acts to practise both Medicine and Surgery. The physical fitness of each candidate is determined previously to examination by a board of medical officers, who are required to certify that vision is sufficiently good to enable him to perform any surgical operation without the aid of glasses. After being passed by the Medical Board and paying a fee of £1, a candidate is examined in the following compulsory subjects, in which the highest number of marks attainable is as follows :—Anatomy and Physiology, 1000; Surgery, 1000; Medicine, including Therapeutics and the Diseases of Women and Children, 1000; Chemistry and Pharmacy, and a practical knowledge of Drugs, 1000. No candidate is considered eligible who does not score at least one-third of the marks obtainable in each

of the compulsory subjects. Candidates may be examined in the following voluntary subjects, for which the maximum number of marks obtainable is as follows : French, German and Hindustani (150 each), 450; Natural Sciences, 300. The natural sciences include comparative anatomy, zoology, natural philosophy, physical geography and botany, with special reference to *materia medica*: the questions on these subjects are of a very elementary nature. A number less than one-third of the marks obtainable in any of these voluntary subjects will not be allowed to count in favour of a candidate who has qualified in the compulsory subjects. The examinations in Surgery and Medicine are in part practical, and include operations on the dead body, the application of surgical apparatus, and the examination of surgical and medical patients. There are usually two examinations held in each year; the examinations take place a few weeks before the commencement of the Netley terms. Before joining the successful candidates are required to provide themselves with the regulation undress uniform of a Surgeon-Lieutenant of the British service, but without the sword. At Netley young officers are called Surgeons-on-Probation or Candidates.

At Netley there are two courses of instruction held yearly—the winter one, which commences in October, and the summer course, beginning in April. Each course lasts about four months. Probationers are required to attend one entire course. It is better, if possible, to go up for the examination preceding the summer course, as an officer then lands in India at the commencement of the cold season. During the period of residence at the Army Medical School a candidate receives an allowance of 8s. a day, with quarters, fuel and light, an allowance quite sufficient to enable a careful man to pay his way. At the conclusion of the course candidates are required to pass an examination in the subjects taught in the school. The position of the candidates in the pass-list is determined by the combined results of the London and Netley examinations, and, so far as the requirements of the service permit, each officer has choice of Presidency in India according to his position. At Netley the prizes are equally open to the competition of the candidates for the Medical Staff and Indian Medical Service. A Surgeon-Lieutenant's commission dates from the day of passing out of the Netley School.

The Indian Medical Service is divided into three distinct branches, one for each of the Presidencies. Bengal offers the widest field, and better fees are obtained there than in other parts of India, hence the men at the top of the pass-list usually select it.

From the date of leaving Netley until arrival in India the rate of pay is 10s. a day. After a few weeks of leave passage to India is usually arranged on a troopship.

On arrival in Bombay the Bengal officers are ordered to Allahabad, the Madras men to their Presidency town, while the Bombay officers are either kept in Bombay or ordered to proceed to Poona. The "lower standard" examination in Hindustani should be worked for and passed as soon as possible after arrival in India, as no pay other than that described as "Indian pay and allowances" can be drawn until the certificate is obtained.

In each Presidency the Indian Medical Service is practically divided into two departments, military and civil.

The scale of pay shown in our summary applies to officers not holding appointments in the military or civil departments of the Service—that is to say, to officers on general duty who have no specific charges; such pay is seldom drawn for any length of time except on first arrival in India.

*The Military Department of the Service.*—Every officer appointed to the Service is obliged to serve in the army of his Presidency for at least two years, unless special necessity arises in the Civil Department for the curtailment of military service. The first few weeks of Indian Military Service are usually passed at a Station Hospital, doing duty with English troops. After a short time officers are appointed to native regiments, either as extra medical officers or to the officiating medical charges. Regimental medical work is, as a rule, very light. It consists in morning and evening visits to hospital, the attendance on brother officers and their families at their bungalows, and on native officers in the huts when seriously ill; the examination of recruits; the attendance at occasional parades and field-days; in sitting as a member on medical or other boards; attending at mess and other regimental meetings; and in looking after the sanitary condition of the "Lines." Regimental appointments are held by officers from the rank of Surgeon-Lieutenant to that of Brigade-Surgeon-

Lieutenant-Colonel. In addition to regimental charges there are in the Military Department the following appointments:—Administrative appointments, five in Bengal, three in Bombay and four in Madras; secretaryships to the Surgeons-Major-General, one in each Presidency; medical store-keeperships, three in Bengal, one in Bombay and one in Madras; staff surgeoncies; and one Bengal military asylum appointment.

Officers holding the principal administrative appointments and substantive military charges of the Indian Medical Service receive at present the following consolidated salaries:—

	Rs. per mensem.
Surgeon-Major-General, Bengal .. ..	2700
"    "    "    Madras .. ..	2500
"    "    "    Bombay .. ..	2500
Surgeon-Colonel { from .. ..	2250
{ to .. ..	1800
Brigade-Surgeon-Lieutenant-Colonel or Surgeon-Lieutenant-Colonel of 20 years' service and upwards in substantive charge of a native regiment .. ..	1000 with Rs. 00, horse allowance in Cavalry regiments.
Surgeon-Major under 20 years' service in substantive charge of ditto .. ..	800 with Rs. 00 ditto.
Surgeon-Captain above 5 years' full-pay service in substantive charge of a native regiment .. ..	600 with Rs. 00 ditto.
Surgeon-Captain or Surgeon-Lieutenant under 5 years' ditto in substantive charge of a native regiment .. ..	450 with Rs. 00 ditto.

Medical charges are of two kinds—substantive and officiating. The first is held by an officer as his fixed and permanent appointment, and for such a charge an officer is entitled to the monthly consolidated pay laid down in the above scale. An officiating charge is held by an officer who is acting temporarily in an appointment during the absence of the officer whose substantive charge it is. An officer while officiating does not receive the consolidated pay of an appointment as laid down in the above scale, but the Indian pay and allowances of his own grade, plus half the staff pay of the appointment in which he is officiating. The staff pay of an appointment is the difference between the Indian pay and allowances and the consolidated pay of the permanent incumbent. The extra allowance for an officiating charge is, however, never less than Rs. 100 per mensem. Officers may pass the first eight years of their service before obtaining substantive charges. While serving in the Military Department, furlough out of India, at the discretion of the Commander-in-Chief, for no longer a period than one year, capable of extension to two years' absence from duty, can be obtained on the following pay:—

After arrival in India, on first appointment .. ..	£200 a year.
After the commencement of the fifth year's active service for pension .. ..	£250 "
After the commencement of the tenth year's active service for pension .. ..	£300 "
After the commencement of the fifteenth year's active service for pension .. ..	£400 "
After the commencement of the twentieth year's active service for pension .. ..	£450 "
After the commencement of the twenty-fifth year's active service for pension .. ..	£500 "

Two months' privilege leave can also be obtained during each year, and shorter periods of leave, ten and three days at a time, are frequently granted.

*The Civil Department.*—The two years of compulsory military duty ended, an officer has the option of deciding whether he will continue his military career, or whether, while continuing to hold his army rank and privileges, he will enter the civil side of the Service. All officers who enter the Civil Department are, of course, liable to be recalled to military duty at any time of emergency or for active service. Civil employment is a privilege and not a right; but any man wishing for civil work can obtain it sooner or later, as vacancies occur. It is a great advantage to enter civil life as soon as possible after the period of enforced military duty is completed, for promotion in many civil branches depends not on seniority in the Indian Medical Service, but on seniority in the province served in or special line taken up. Appointments in the Civil Department, as in the military, are of two kinds, or rather officers may hold appointments in two capacities—as substantive and officiating incumbents. All officers, whether officiating or holding substantive charges in the Civil Department, are subject to the Civil Service regulations as regards leave of all kinds in India, joining time,

travelling allowances and regulations and pay in India. An officer holding the substantive charge of an appointment is always entitled to the full pay and allowances. On first joining the Civil Department it is usual to officiate in some appointment. After an officer has officiated in civil appointments continuously for three years he is considered to be permanently in civil employment and is entitled to all the privileges under the Civil Service regulations. In civil life short periods of leave—"three days" and "ten days" leave—are less easily obtainable than when serving under the military authorities; the amount of privilege leave is also only one month during the year. The furlough regulations are, however, more generous both as to length of leave and as to pay while out of India. To an officer who has rendered three years' continuous service in civil employment furlough for not more than two years may be granted unconditionally on medical certificate and also without medical certificate: (1) if he has rendered eight years' active service in civil employment; (2) if he has not rendered eight years' active service in civil employment, provided that he has rendered eight years' service in India in both the Civil and Military Departments; (3) if the furlough applied for be other than his first furlough, provided that he has rendered three years' continuous service since his return from furlough. The two years' furlough may, on medical certificate, be extended for not more than one year. An officer of the Civil Department can obtain a year's furlough on medical certificate if he has not rendered three years' continuous service. An officer on furlough is entitled to a leave allowance equal to half his average annual salary for the three years preceding his furlough, subject to a maximum limit of £1000 and a minimum of £500. During furlough added for the portion of service passed in the Military Department the minimum pay is that prescribed by the military rules to which the officer was subject. If an officer take furlough before completing three years' continuous service in the Civil Department, or before being confirmed in a civil appointment, he does so under the military furlough rules, and on his return to India may be relegated to military duty.

The civil medical appointments comprise administrative appointments, secretaryships to the administrative officers, civil surgeoncies, medico-political posts, the professorships in the medical colleges, the superintendentships and resident appointments in the large hospitals, appointments in the sanitary, prison, assay and statistical departments, curatorships, superintendentships of emigration, assistantships to the opium agents, staff-surgeoncies to the Viceroy and Governors, and appointment as surgeon-naturalist to the Marine Survey Department. There are six administrative appointments in Bengal, one in Bombay, and two in Madras. In Bengal there are fourteen professorships to be filled in the Calcutta and Lahore Medical Colleges, while Madras and Bombay have each nine chairs to provide with occupants from their respective services. In the Sanitary Departments the officers are divided into two grades—sanitary commissioners and deputy sanitary commissioners; there are ten sanitary appointments in Bengal, six on the Bombay side and two in the Madras Presidency. In the Prison Service officers may hold the inspector-generalships of Gaols, the superintendentships of Gaols, or, as civil surgeons, the visiting medical charges.

In order to qualify for the Assay Department four certificates have to be obtained in special work; it is necessary to attend certain courses in London which extend over a period of seven months. The civil surgeons correspond with the general practitioners in England. As a rule there is one civil surgeon in each station. In addition to their work among the European and Eurasian population, almost all civil surgeons have dispensaries under their superintendence. To these institutions the civil surgeon is in much the same relation as are the visiting surgeons and physicians to our large hospitals in this country. Civil surgeons are also superintendents of vaccination, and are frequently in medical charge of the district gaols. The medical officers serving under the Foreign Office are stationed at the native courts; they have as a rule all the duties of civil surgeons to perform, and in addition frequently important political work to carry out.

The pay of officers in the Civil Department varies from Rs. 400 to Rs. 2700 a month. The civil surgeons have nearly the whole of the private practice of India in their hands. The pay in the Civil Department is nearly always considerably more than in the Military.

Before retirement (it may be the day before) the services

of all officers lent to the Civil Department are replaced at the disposal of the military authorities. The following are the rates of retiring pensions and half-pay at present offered: Pensions, after thirty years' service for pension, £700 per annum; after twenty-five years, £500 per annum; after twenty years, £365 per annum; after seventeen years, £292 per annum. Rates of half-pay for a Brigade-Surgeon-Lieutenant-Colonel and Surgeon-Lieutenant-Colonel, 11s. a day; for a Surgeon-Major, 9s. 6d. a day; for a Surgeon-Captain, 7s. a day; and for a Surgeon-Lieutenant, 3s. a day. Officers admitted to the Service will, after retirement on pension before completing thirty years' service, be liable to recall to military duty in case of any great emergency arising, up to fifty-five years of age.

*Wound and Family Pensions.*—Medical officers are entitled to the same allowances on account of wounds as other officers holding the corresponding military rank. Pensions to widows, varying from £120 to £50 a year, and compassionate allowances to children, varying from £20 to £12, are granted in cases where officers die before retirement. In addition to these pensions and compassionate allowances, every officer of the Indian Medical Service is obliged to subscribe to the Indian Service Family Pension Fund. From this fund pensions to widows are granted, varying, according to the rank of the deceased officer, from £160 to £40 a year, and to children, according to age, from £10 to £30 a year; the pensions for boys cease at the age of twenty-one; while the £30 pension for a daughter rises to £45 on attaining the age of twenty-one years and continues during life or until marriage.

Officers of the Service are eligible for the military distinction of the Bath and for good-service pensions. As a rule "the Bath" is only given to men who remain in military employment. The Knightships and Companionships of the Star of India and of the Indian Empire are given to officers of the Civil Department. The Order of St. Michael and St. George is occasionally given to officers when sent on duty beyond the Indian frontier. The Victoria Cross and the Distinguished Service Order can also be won by members of the Service. Six of the most meritorious officers are named Honorary Physicians and six are named Honorary Surgeons to Her Majesty.

## THE COST OF MEDICAL EDUCATION.

It is very desirable that the parents and guardians of youths who contemplate entering upon a course of medical study should have the means of ascertaining with some precision the whole cost which will have to be incurred in the educational process. It is obvious that this cost is by no means covered by the tabulated fees which appear in our pages to-day. Indeed, these fees do not comprise the whole expense of medical education in the narrowest and most direct sense of the word, since there are incidental expenses for books, instruments, and the like, which cannot be avoided by the student. Over and above this there is the additional cost, by no means inconsiderable in an ordinary case, of maintaining him away from home during his career of studentship. A general impression upon these matters might, no doubt, be attained without much trouble by any person of intelligence, but such general impressions do not fully meet the case. For one thing, there is an appreciable difference in respect of these incidental expenses between localities. It will often be a matter of consideration whether a lad should be consigned to one centre of education or to another, and in such a case the question of relative expense may well enter into the discussion.

With the view of elucidating this matter the Editors of THE LANCET issued last year a circular to medical students from which a body of most useful information bearing upon this point was obtained. The results have been already made public; but, as they are of more than fugitive interest, we reproduce to-day the main substance of our article founded upon the replies to this circular and published in our Students' Number of last year. The figures given below represent annual expenditure, and as the student's curriculum covers a period of five years, it will be understood that the provision to be made for his maintenance will be proportionate to this space of time.

The returns by the light of which we are writing are sufficiently numerous to yield averages, and it is easy to see that the average man spends more money in the metropolitan centres than in the provinces, and that the standard of living and the cost of maintaining a given standard both vary from

place to place. The most complete statement that we have received comes from a student at the Leeds school, where great economy in the matter of personal expenses appears to prevail. This return slightly generalised may serve as a type. The student in question finds it necessary to occupy the one room which serves his purposes during ten months of the year, for which the—

	£	s.	d.
Rent, including attendance, amounts to ...	13	0	0
Food for the same period ...	15	0	0
Clothes (as to which item he seems to enjoy some advantage) ...	3	10	0
Washing &c. ...	2	0	0
Stationery and incidental expenses ...	4	0	0
Examination expenses ...	7	0	0
Recreation ...	15	0	0
Books &c. ...	4	0	0
Unaccounted for ...	1	10	0
<b>Total ...</b>	<b>65</b>	<b>0</b>	<b>0</b>

This case is exceptional in more respects than one, although it is by no means unique save in respect of the fulness with which details are given. It is not, however, in many instances that such a high standard of economy can be attained. A few words upon the various items enumerated will make this clear.

The cost of rent is here exceptionally light, and this naturally enough is a charge which varies greatly with the locality. One student who occupies rooms in a very desirable suburb of London pays £2 a week for this item alone, but his case is more exceptional in the opposite direction than that of the Leeds man quoted above. In the matter of rent private lodgings in London are not on an average more costly than in most provincial towns, and rule—as the merchants say—at about 15s. a week. Our returns show that they vary from 9s. to the maximum of 40s. already mentioned.

Referring to other centres, the rent of lodgings in Edinburgh is probably slightly less than in London; in Dublin about the same as in the English metropolis. In Edinburgh there is a sort of residential club known as University Hall, which affords facilities of social intercourse and mutual aid, as, for example, in the lending of books, which is practised systematically among the resident students. In addition to these amenities, the institution secures them lodgings at a very moderate monthly rent. Glasgow lodgings again run at about the same level, while in Birmingham the average of our returns is cheaper still, not exceeding 11s. a week. The cheapest district of which we have any full information is Aberdeen, where both in the matter of rent and of food our correspondents speak of an economy that is altogether exceptional, and indeed in one instance reaches the extreme limit for rent of 3s. 6d. a week in summer and 4s. 6d. in winter, the additional shilling representing the cost of fuel to cope with the Scottish winter. It should, however, be added that in this case our correspondent shares rooms with another student, thus minimising their cost. One of our correspondents from this town confesses to living in better style and more expensively than the majority of the students at a cost for rent not exceeding 14s. a week; and another, who illustrates in his own case the system of sharing rooms, says that under that system "a student can live in Aberdeen well and comfortably for the small sum of 12s. a week;" and he proceeds to avouch cases in which men have lived and fared well at an inclusive charge for board, lodging, coals, and gas of 10s. a week. In towns like Cork and Leeds the average rises above this limit, but probably 15s. a week is here almost a maximum charge. In the Irish provincial towns particularly the rent of rooms is very low, 5s. and 6s. being by no means below the average. A somewhat higher rent is asked, but still ranging about 10s. a week, in English provincial towns, such as Stockton, or Rugby, or Devonport; but residence in these involves constant railway travelling, and would hardly be adopted for the purposes of a student's career, unless some special considerations influenced the decision with which fine questions of comparative expense would not come into competition.

There remains to be mentioned the lodging accommodation afforded by residential colleges, hospitals, and the like institutions. But concerning these a word may suffice. The advantages of residence in a college are manifold, but they are chiefly of the intellectual and social kind. The cost is not less than that of private lodgings thriftily selected. There may also be in some instances impatience on the

part of the student of the control imposed by the regulations which are necessarily devised for the orderly conduct of such institutions. Nevertheless, the select society, and even the inevitable restraint, of such institutions are of great service, especially to young students who have reason to dread nothing more than solitude and an irresponsible control of any considerable proportion of their own time. On the other hand, the cost of board and lodging in such institutions is not greater than the average cost of the same accommodation in private lodgings in their neighbourhood. The following is a list of London schools for medical students, complete so far as the Editors have been able to make it, which have residential colleges attached:—St. Bartholomew's Hospital, Guy's Hospital, King's College, St. Mary's Hospital, and Middlesex Hospital.

At many schools a register is kept of suitable lodgings which can be recommended to students. It is known that such registers are kept at the following schools, but it is feared that the list is imperfect:—London Hospital, St. Thomas's Hospital, Westminster Hospital, Aberdeen University, Anderson's College, Glasgow, and the Catholic University, Dublin.

A very excellent plan, and one that involves no inordinate expense, is to place a student in the house of a medical practitioner in the neighbourhood of the school which he is attending. It will be found that when the educational facilities thus placed in his way are taken into account, in addition to the mere commercial value of his board and lodging, the arrangement is usually a very economical one. The opportunities for doing this are, of course, not unlimited, but they are sufficiently numerous to merit mention here.

Passing to the next item in our typical account, that of food, we may observe that here again our Leeds correspondent has set a standard which will be rarely attainable. It can be paralleled in a very few instances only from our returns. The cost of board is generally not less than that of lodging, and may fairly be taken at about the same figure. As a matter of fact, the similarity is closer than would be at first supposed, and, speaking broadly, it may be said that where the one item is low the other is low also. It would seem as if the prevalence of high prices or of low prices, as the case may be, affects both items, and affects them equally. It would then be more proper in an ordinary case to put this item down at £30 a year than at £15. The remaining items in the statement may be accepted without much comment, except perhaps that which is entered under the head of clothes. This is an item of expenditure not properly chargeable to the education account, since the student would in any case be clothed, and the amount expended upon his wardrobe will be determined by his personal habits, and in no sense by his professional studies.

It is very undesirable, and a matter to which more than one of our correspondents has referred in a tone of irritation, that the incidental expenses should be overlooked. We have already alluded to them above, but it seems not unimportant, for the purpose of preventing misunderstanding, to refer more pointedly and specifically to them here. The composition fee which is published by the various schools, and is in a sense a comprehensive charge, may easily be supposed to be more comprehensive than it is. A glance at our tables will show exactly how it is arrived at and what it covers. Broadly it may be said to include all the professorial fees. But it does not include books—this is a matter of course. Equally it does not include instruments, and these two items together cannot be fairly written down at less than £8 a year in an ordinary case. Many circumstances may occur to falsify this estimate. A successful student may largely supply himself with books by prize winning, or access to a suitable library may minimise his personal requirements in this respect. With instruments, bones, parts for dissection, and the like, the case is somewhat different, and the expenditure under these heads can only be avoided at the expense of the student's education. A niggard hand in such matters makes therefore a grievous mistake, and this should be clearly appreciated at first, otherwise the temptation to undue parsimony will be supported by a grudging mind in their bestowment. Another item which is for very good reason omitted from the composition payment is the charge for examination fees. The reason of this will be at once apparent if it is only considered that the teaching bodies and the examining bodies are distinct, and that whereas the composition fee represents a sum payable to institutions of the former class, the examination fees are receivable by institutions exercising the ex-

aming function. It will be hard to quarrel with an arrangement which is justified by the importance of paying the fee to the right person. Less obvious, but of the same kind, is the explanation of the circumstance that tutorial fees are not included in the composition. Many students pass through their curriculum by the aid of lectures and professorial instruction only. This is very possible when only crucial examinations are attempted. But for competitive examinations additional instruction is generally an indispensable preparatory. Such additional instruction must of course be paid for, but its occasional character prohibits its inclusion with the indispensable items in the comprehensive payment. From what has last been said it will be perceived that the cost of the professional course, especially in these latter items, will be largely affected by the nature of the qualifications upon which the student sets his mind. A list of examination fees appears on page 541, from which a sufficiently precise estimate may be formed of the amount which it will be necessary to expend in this direction. It will, of course, be borne in mind that failure to pass an examination at the first sitting may involve the payment of a second fee upon a subsequent occasion. In forming an estimate of prospective expenditure this contingency should not be overlooked.

## NOTES AND NOTE-TAKERS.

"If a man write little," says Lord Bacon in one of his best known Essays, "he need have a great memory." The passage refers to the habit of taking down notes of what is observed or read—a habit which all students, but more especially the medical student, cannot too assiduously cultivate. The power of taking notes efficiently does not come by nature, as many suppose, but is an art which improves with cultivation, and through which some of the highest qualities necessary to a successful medical career are developed. We are not now referring to the expert note-taker who has devoted years of hard study and long practice to the acquirement of the degree of skill which is necessary for the practice of his vocation, but to the student note-taker who takes notes of lectures for the guidance of his own study and as an aid to his memory. Indeed, it is very questionable if the student note-taker would gain much by attempting a *verbatim* note, or whether a good deal of the educational value of the note would not be lost in the effort. The educational value of note-taking depends on the habits which it develops. One of these, in a very marked degree, is the habit of punctuality. The professional note-taker is rarely late for his engagements, and so the student note-taker will not care to lose the connexion between one lecture and another on a subject in which the lecturer has interested him. He is rarely absent from his class, and the habit of regularity is thus markedly developed. A lost lecture or two leaves a hiatus in his note-book which costs much reading and research among complicated text-books to fill up. As a rule, it will be found that students attend to whatever is worth hearing; but the student who has developed a habit of note-taking is never caught napping in his class or furtively perusing newspapers. The attention which is necessary to careful note-taking has become habitual with him. He has developed the habit of continuous attention, one which a student qualifying himself for any career in life will find most valuable. Thoroughness is another attribute which note-taking tends to foster. Points are noted in the class-room and at the clinical lecture which after-study will expand, and which in many instances give the keynote to future research. These are the main qualities which go to make a successful practitioner; and, if proof were wanted, the success of those medical men who have cultivated this habit will afford it. It would of course be invidious to specify them by name, but probably half a dozen of the most successful medical men in London, taken at random, would be found to be excellent note-takers, from habits acquired in their career as students.

The student's note-book reflects the character, not only of the lecturer, but of the teacher. Diffuseness in a lecturer is a common and sometimes fatal cause of discouragement to the student at the outset of his career. The young note-taker finds it impossible to lay hold of any definite statement. We have known lecturers on subjects in the medical curriculum who seemed to think they fulfilled their mission as teachers of students by muttering in a low tone of voice from manu-

script at the rate of 250 words per minute. Such a travesty of teaching inspires in the student undisguised contempt. The matter is not assimilated if it is even heard or listened to by the student. An expert note-taker would probably despair of learning anything from such perfunctory instruction.

Again, notes to be of service to the student must be spontaneous and must be taken *con amore*. If full benefit is to be obtained the note-taking must be inspired by the lecturer and by the nature of the instruction. The principal objects of note-taking are defeated by compulsion, or by bribery in the form of prizes offered for the best note-books. The process in this case becomes mechanical and loses its educational value. Perhaps the most useless of all kinds of notes are those which are dictated to the students by the lecturer. Notes to be useful must be made with brains, and the brains must be supplied by the students.

Note-taking has a stimulating effect on the teacher, and it would be exceedingly useful to lecturers to take an occasional glance through the note-books of their students. The results would confirm the excellences of the lecturer and improve his deficiencies. It is said that students do not care to use notes and so do not trouble about acquiring the art of taking them. Students are the best judges of the value of note-books.

Some teachers, of whom Professor Struthers, who has done so much in the interests of medical students, may be taken as the type, object to note-taking. Addressing the General Medical Council on one occasion, he said: "The student takes his notes, puts his book in his pocket, and walks out, knowing no more about the subject than a mere reporter would do." If the student knows at the end of the lecture as much as the experienced reporter would do after listening, to it, he would have reason to congratulate himself on the success of diligent note-taking. The very habit which the reporter has acquired at so much pains gives him the power, which was so highly developed in Lord Macaulay, of recalling the points of a long lecture, and of being able in many instances to quote without reference to his note-book the exact words of the lecturer, and to remember them. There are many who believe that lectures and note-taking alike are merely so much useless expenditure of time and energy. "The information," it is said, "can be better got out of a text-book." We prefer Professor Gairdner's view, who in a lecture so long ago as 1877 said: "The text-book must be rewritten or completely revised, edition after edition, or it must perish. Professors' lectures must be freshly brought up, altered, amended, often completely remodelled, almost from year to year, or they are naught." "Systematic lectures, which are mere repetitions of a text-book, are not indeed wholly useless, but they can never rise above the usefulness of the text-book, any more than water can rise above its fountain-head. But systematic lectures that are informed by the spirit of a living man are valuable to you above a text-book, just in proportion as you have reason to have a living faith in that man and in his ability to guide you aright." It is the living voice of the teacher that makes all the difference from the lifeless page. Medical students cannot afford to neglect any of the aids which render their task lighter or their knowledge more accurate in the wide domain of medical science; and when in the search for knowledge they are brought face to face with useful facts it is well to fix them by doing what Captain Edward Cattle advised in reference to the search for his quotations, "When found, make a note of."

It is not every clinical teacher who has the power to impress his students with a lasting picture of a disease as it comes under his notice. Details are forgotten in after years—it may be in months or even in weeks. The impression has faded, and nothing of the demonstration remains in the memory of the student to testify to his honest ward work or to aid him in his future practice. Herein the value of good note-taking is manifest. Dr. Gowers, who has published some of the most erudite and valuable works to be found in medical literature, has frequently expressed his deep indebtedness to his notes. He has said: "I am deeply indebted to shorthand, for without it I never could have accomplished any of my work." The records of his cases are probably unique in the history of note-taking. The written letter remains, and no detail of any case which has come under his observation is ever forgotten or lost sight of.

The practical question for the student is—How am I to take notes in the class? The answer is very simple. Many students know a little shorthand. To them the task will be

more easy, and the only advice which it is necessary to give to these students is to ask them to improve their shorthand, to be contented with a few well-summarised notes written on the left side of their note-book only, leaving the right hand page free for home use. For it is an essential that the rough class notes should be extended. Those students who have no knowledge whatever of shorthand will speedily acquire an abbreviated form of longhand which will probably serve their purpose. The general direction about writing upon one side of the note-book in the class-room should also be attended to by them. The last point of practical interest is to advise students to secure well-bound, substantial note-books which will be useful for reference in future years.

Note-takers nowadays have a very easy time of it compared with what existed in days gone by. If students refer to the early numbers of THE LANCET published in the years 1823-24-25-26 they will find some specimens of note-taking which will excite their admiration, and which excited the consternation of most of the medical teachers in London at that period. Sir Astley Cooper's lectures had never been published—had never indeed been written—when in full array, in the year 1823, an almost *verbatim* report of a most important lecture appeared in the first number of THE LANCET. Complete ignorance prevailed as to the individuality of the reporter and of the editor of the new medical paper. The reports of these lectures were continued week by week, and, all efforts at discovering the author having failed, a notice was printed and posted up in Guy's Hospital threatening any student found reporting for THE LANCET with instant expulsion from the hospital. At length suspicion fell upon Mr. Thomas Wakley, and Sir Astley Cooper determined to ascertain whether he was the offender. Mr. Wakley was one night sitting in his consulting-room in Essex-street, Strand, reading over the proof sheets of one of these lectures, when, before he had time to conceal the pages, Sir Astley Cooper was announced. The eminent baronet sternly eyed the young journalist for a brief space, but gradually his features relaxed into a genial smile. A similar smile made its appearance on the face of Mr. Wakley, thus caught as it were red-handed. They shook hands, however, and after some conversation it was arranged that the remaining reports of Sir Astley Cooper's lectures should be sent to him for revision before they were published in THE LANCET, and to this the Editor at once agreed. On another occasion a report appeared in THE LANCET of the clinical instruction given by Sir Antony Carlisle at the Westminster Hospital, which so enraged the physician that he told his students that they had his full authority to drive the note-taker from the hospital with "large sticks." The note-taker had to be protected from the students by some coalheavers and brewers' men.

But students nowadays live in better times. No such restrictions are imposed upon them, and it simply remains for them to seize the opportunities which abound for acquiring information, and when they have obtained it "meet it is" for them, as it was for Hamlet, "to set it down."

## UNITED HOSPITAL ATHLETICS.

NOTHING remarkable has occurred during the past year in hospital athletics. Guy's have shown themselves to be the best all-round athletes by winning the challenge cup for cricket, athletic sports, cross-country running and lawn-tennis, St. Thomas's, St. Bartholomew's and St. George's winning Rugby football, Association football, and rowing respectively. Several of the competitions were most keenly contested, notably that for the Association football cup, the final tie of which had to be fought out no less than three times.

The scheme of Amalgamated Sports' Clubs is slowly spreading, and is now adopted at most of the leading hospitals; it not only saves an immense amount of trouble and time, but it also adds largely to the incomes of the different clubs. Hospital clubs are proverbially poor, and it really seems that the old system of small subscriptions to each separate club had more to do with their poverty than an absence of *esprit de corps*. Interest in the success of his hospital at sports is however, as a rule, of a spasmodic nature to the ordinary medical student; it may be that the absorbing interest of his work precludes him from being very energetic as re-

guards sports, for when anatomy and physiology are left behind, clerkships and dresserships forbid the regular indulgence in games, especially in matches, which occupy a whole afternoon. The whole routine of a medical student's life in London is antagonistic to athletic sports. Close attention during the first two years to the dissecting-room and physiological laboratory, and later to the duties of clerk or dresser, rather tends to induce a system of loafing during leisure hours than indulgence in exercise. If, however, "the fresher" will only make up his mind to take regular and sufficient exercise from the commencement of his career he will find it less hard to overcome that feeling of slackness which so often follows several hours of dissecting or work in the wards—a feeling that is generally increased rather than diminished by the dim surroundings of the ordinary "diggings"—especially, too, as the "fresher" is not as a rule used to the somewhat uninvigorating atmosphere of London.

It would be advisable, therefore, for the first year's man to get thoroughly acclimatised to his new surroundings before indulging in any real hard work. He will feel more inclined to take exercise and engage in sports.

The contest between the United Hospitals A.C. and the Edinburgh University again ended in favour of the hospitals by 8 points to 3, making the fourth successive win for the hospitals since the inauguration of the competition in 1889. The following were the winners:—

For THE U.H.A.C.—100 yards: H. T. Bell (Guy's), 220 yards: H. T. Bell (Guy's), 440 yards: J. W. Summerhayes (St. Mary's), One Mile: H. A. Munro (Guy's), Three Miles: H. A. Munro (Guy's), Half-mile: P. W. James (St. Bart's.), Putting the Weight: W. G. West (St. Bart's.), Long Jump: A. P. Square (Middlesex).

For THE E.U.A.C.—120 hurdles, T. M. Donovan. High Jump, R. Williams. Throwing the hammer, T. M. Donovan.

The meeting was held in wretched weather, rain coming down continuously. A dinner was given in the evening to the members of the Edinburgh team, at which the President of the U.H.A.C. took the chair, at the Guildhall Tavern.

The United Hospitals sports were held at Stamford Bridge on June 18th, and the increased number of spectators proved the wisdom of holding the sports on a Saturday. The events as a rule were keenly contested, and the times an improvement on former years. No less than three records were broken in the 220 yards, half-mile, and three miles. After fourteen years of ill-success Guy's have managed once more to become possessors of the shield. In 1878, by the aid of L. Stokes, F. J. Shepherd and J. A. Fraser, they secured a win, and also made a good fight in the following year; but not till 1887 did they come into prominence again, when W. G. Mitchell won two events for them. For three years more they failed to get one event, but last year Munro placed both the mile and three miles to their credit. They won six events this year and gained a second in one event, and the runners up—St. Bartholomew's—won three and gained six seconds. The following were the winners:—

100 yds.: H. T. Bell (Guy's), 10½ sec. 220 yds.: H. T. Bell (Guy's), 22½ sec. 440 yds.: J. W. Summerhayes (St. Mary's), 52½ sec. 880 yds.: P. W. James (St. Bart's.), 2 min. 2½ sec. One mile: H. A. Munro (Guy's), 4 min. 35½ sec. Three miles: H. A. Munro (Guy's), 15 min. 17½ sec. 120 yds. hurdles: P. R. Lowe (Guy's), 17 sec. High jump: H. T. Bell (Guy's), 5 ft. 6½ in. Long jump: Jas. McIntosh (St. Bart's.), 20 ft. 4½ in. Throwing hammer: Jas. McIntosh (St. Bart's.), 80 ft. 11 in. Putting weight: M. Broton (St. George's), 33 ft. 10 in.

The records stand as follows:—

100 yds.: B. B. Conolly (Guy's), 10½ sec. \*220 yds.: H. T. Bell (Guy's), 22½ sec. 440 yds.: T. A. Guinness (King's), 51½ sec. \*880 yds.: P. W. James (St. Bart's.), 2 min. 2½ sec. One mile: H. A. Munro (Guy's), 4 min. 34½ sec. \*Three miles: H. A. Munro (Guy's), 15 min. 17½ sec. Putting weight: W. G. West (St. Bart's.), 88 ft. 3 in. Throwing hammer: T. E. Fraser (St. Bart's.), 93 ft. 10 in. Long jump: B. C. Green (St. Bart's.), 21 ft. 10 in. High jump: P. Pierre (Westminster), 5 ft. 6½ in. 120 yds. hurdle: B. C. Green (St. Bart's.), 10½ sec.  
\* Made this year.

In the Inter-hospital Sports the Challenge Shield has been held by—

St. Bartholomew's, eight times; Guy's, six times; St. Thomas's, five times; King's, three times; St. George's, three times; London, once.

The RUGBY FOOTBALL CUP was once more secured by St. Thomas's, who have had a monopoly of it for some years. This year Guy's were the favourites at the commencement of the Cup ties, but were beaten during the second round by St. Thomas's after a close and exciting match. F. W. Goodlive (captain) and E. Bromet (three-quarter back) were the most conspicuous players for the winners. The various ties resulted as follows:—

First round: Winners—Guy's, University, St. Thomas's. Drew byes: Middlesex, St. George's, King's College, St. Bartholomew's. Second round: Winners—St. Thomas's, Middlesex, St. Bartholomew's, St.

George's. Third round: Winners—St. Thomas's, St. Bartholomew's. Final: St. Thomas's won very easily from St. Bartholomew's. St. Thomas's: V. Graham (back), E. Bromet, J. L. Frain, and W. H. Thorman (three-quarter backs), N. Hood, A. Montague (half backs), F. Goodhue, J. Carver, R. Storer, R. Ord, H. Knight, H. Haward, P. Blaber, E. Sutcliffe, and W. Ashford (forwards).

The Cup has been won by St. Thomas's five times, Guy's four times, St. George's three times, St. Bartholomew's twice, by London and Middlesex once each.

THE ASSOCIATION FOOTBALL CUP produced the most keenly contested of all the inter-hospital competitions this year—in fact, three attempts to finish a final have not been before recorded in hospital athletics. Upon the first two occasions St. Mary's ought to have won and paid dearly for misused opportunities by losing at the third attempt, having the misfortune in the meanwhile to lose their most prominent player, E. G. Moon; but it is only fair to the winners to state that they had had bad luck all through the season, no less than half a dozen of their best players being incapacitated at one time or another.

The Cup has been won four times by Guy's, twice by St. Bartholomew's and once by St. Thomas's.

The survivors of the first round were St. Mary's, London, St. Bartholomew's, University College, Guy's, Middlesex, St. Thomas's and Charing-cross. Second round: Winners—St. Mary's, St. Bartholomew's, Guy's and St. Thomas's. Third round: Winners—St. Mary's and St. Bartholomew's. Final: St. Bartholomew's. This was contested three times, the first two ending in draws slightly in favour of St. Mary's, but upon the last occasion St. Bartholomew's obtained a slight lead and kept it to the end. St. Bartholomew's team: E. H. Fryer (goal), F. E. Fernie (captain) and J. Cropper (backs), F. Lewarne, W. Wyllys and W. Pope (half backs), and W. E. Bond, J. F. Fennie, P. J. Dixon, G. R. Fox and C. Neill (forwards).

In the Cricket Cup ties Guy's team showed a most decided superiority over their opponents. In the final tie Guy's met Charing-cross and won rather easily by six wickets.

The principal scores for Guy's were: J. H. Bettington, 3 and 31 not out; E. T. Shorland, 68 and 13 not out; W. J. Hancock, 43. Bettington took nine wickets for 99 and Joyce six for 85. For Charing-cross: C. H. Russell made 18 and 43; H. Thomas, 21 and 30; C. W. Young, 6 and 33.

The winners played good consistent cricket throughout the season and beat several of the best suburban clubs. The United Hospitals Cricket Club, as usual, played only a few matches and on each occasion failed to play anything like their proper strength. The cup has been secured five times by Guy's, twice by King's and once by St. Thomas's.

The Lawn Tennis Cup was won this year by Guy's, who met St. Thomas's in the final and beat them by four points to two.

The Singles resulted as follows:—W. Hancock (Guy's) beat G. W. Bird (St. Thomas's); G. Webb (Guy's) beat C. Knox (St. Thomas's); Davis (St. Thomas's) beat E. Reid (Guy's). The Doubles: W. Hancock and E. Reid (Guy's) beat Bird and Knox (St. Thomas's); Webb and Coulson (Guy's) beat Davies and Ransome (St. Thomas's).

The third contest in the doubles ended in favour of St. Thomas's, as the Guy's men withdrew when "one set" all was cried, they having already played off a tie in the morning. St. George's have won the cup three times, Guy's once, and St. Thomas's once.

Only three hospitals entered for the Rowing Cup ties, St. George's, London (holders) and Middlesex. The holders were never in it with the powerful St. George's crew, who, stroked by J. C. Gardner, had the race at their mercy from the start. There was a good race for second place, London only just beating Middlesex on the post.

St. George's.—J. Hawes (Bow), A. S. Ransome, J. W. Noble, J. C. Gardner (stroke), A. Thomson (cox). Winners.—1885, London; 1886, Middlesex; 1887, Middlesex; 1888, St. Thomas's; 1889, St. Thomas's; 1890, St. George's; 1891, London; 1892, St. George's.

The United Hospitals Hare and Hounds Club, under the secretaryship of A. N. Wilde and captaincy of H. A. Munro, enjoyed a fresh lease of life this year, and, amongst other events, was almost successful in beating the Oxford Union Hare and Hounds, the first two places in the contest being taken by Munro and Wilde respectively.

The Ten Miles Handicap was won by W. H. Kenrick (London), 9 min. start, A. N. Wilde (St. Bart's.), 1¼ min. start, being second. The Four Miles Handicap was won by Munro, followed home by two Guy's men, Eastment and Wilmot.

Three hospitals entered for the Challenge Cup, which is competed for over the long-distance course, with the result that Guy's won the Cup, St. Bartholomew's beating St. Mary's for second place.

The first five places were taken by H. A. Munro (Guy's); A. N. Wilde (St. Bart's.); A. Hay (St. Bart's.); M. Tressider (Guy's); P. Wilmot (Guy's).

An attempt has been made to start a United Hospitals Swimming Club. St. Bartholomew's, St. Thomas's and Guy's

have at present joined, and it is hoped that next summer several others will cast in their lot with the club. St. Bartholomew's have a very good polo team and gave an excellent account of themselves during the season.

## CHANGES IN THE MEDICAL SCHOOLS AND HOSPITALS.

AT *St. Bartholomew's Hospital* there have been several changes. Sir William Savory has retired from active work in the wards, and has been appointed consulting surgeon. Mr. Marrant Baker has resigned. Messrs. Marsh and Butlin have been elected full surgeons. Messrs. Bowly and Lockwood have become assistant surgeons. Mr. Ackland has joined the Dental Department. In the Medical School Mr. F. Womack has been elected Lecturer on Physics, and Dr. Shore Lecturer on Biology. Dr. Fletcher has replaced Dr. Hamer in the Physiological Department, and Mr. C. H. Roberts has been appointed an Assistant Demonstrator of Anatomy. Dr. Calvert has joined Drs. West and Garrod in the Demonstrations in Practical Medicine. The Practical Biological work is in the hands of Dr. Shore, who is assisted by Messrs. Groves and Pickering. No appointment has yet been made to the post of Surgical Registrar. It is rumoured that the number of physicians at this hospital will shortly be increased to five, and that a corresponding increase in the number of Assistant Physicians will be also made.

*Charing-cross Hospital.*—The changes in this school have been many and necessary in order to adapt it to the requirements of the Conjoint Board. Biology, Insanity, Public Health, Practical Midwifery and Ophthalmology have become compulsory subjects. The teaching of Biology has been undertaken by Mr. Chalmers Mitchell, of Christ Church, Oxford, who will also hold classes for the Preliminary Scientific Examination. The department of Psychological Medicine is undertaken by Dr. Hack Tuke. The class of Practical Midwifery has been placed under Dr. Routh's care. The new post of Pathologist and Curator has been formed and Dr. Arkle has been appointed to fill it. Mr. Morgan has been succeeded by Mr. Sheild in the teaching of Surgical Pathology. Mr. A. T. Collum is appointed Surgical Registrar, being succeeded by Mr. Gibbs as Junior Demonstrator, and Mr. Dudley Johnston succeeds Mr. Harold as Demonstrator of Physiology.

*St. George's Hospital.*—Sir William Dalby, having resigned his post as aural surgeon, has been appointed Consulting Aural Surgeon. Mr. Bull takes his place on the active staff. Mr. G. R. Turner lectures on Anatomy in succession to Mr. Bennett. Mr. Dent takes charge of the Orthopædic Department. Dr. Rolleston has followed Dr. Delépine as Lecturer on Pathological Anatomy. Mr. F. C. Kempson succeeds Mr. C. Cotes as Demonstrator of Anatomy. It is expected that at the beginning of the year 1893 the number of house physicians and house surgeons will be doubled.

At *Guy's Hospital*, where during later years there had been greater changes than at any other hospital in London, we have no alteration to record this year either in the staff of the hospital or in the Lecturers or Demonstrators in the school, with the exception that Dr. Starling, having been appointed to the Grocers' Research Scholarship, has ceased to be Senior Demonstrator of Physiology, his place being taken by Mr. Tubby. Dr. Fawcett and Dr. Campbell have become Demonstrators of Physiology in addition to Mr. Tubby, and the subject of Biology for Conjoint Students is taught by Dr. Campbell, Mr. Targett, and Dr. Fawcett. Mr. Wade is associated with Mr. Groves in the department of Practical Chemistry during the summer session.

At *King's College Hospital* Sir Joseph Lister, Bart., has been appointed Emeritus Professor of Clinical Surgery with charge of beds, and Mr. William Rose succeeds to the regular

duties of the Professor of Clinical Surgery. Mr. W. Watson Cheyne is now the sole Professor of Systematic Surgery. Mr. Cadman and Mr. Hewlett and Dr. W. A. Turner have been appointed Demonstrators in Anatomy, Bacteriology, and Neuro-Pathology respectively, whilst the new laboratories in State Medicine are placed under the care of Dr. W. R. Smith as Director and Mr. Huntley as Demonstrator.

*London Hospital.*—Dr. Sansom has resigned the Lectureship on Forensic Medicine and Public Health, and in future Dr. Ralfe will lecture on Public Health and Dr. J. F. Smith on Medical Jurisprudence and Toxicology. Special classes in Practical Midwifery and Obstetrical Operations are now held by Dr. Herman and Dr. Lowers, the Obstetric Physicians. A serious loss has been sustained by the College in the death of Dr. Moymott Tidy, who lectured for many years on Chemistry and Toxicology. Mr. Page has now been appointed Lecturer on Chemistry. Dr. W. Fenwick has been appointed a Medical Tutor. Dr. J. F. Smith has been appointed an Assistant Physician and Mr. H. P. Dean an Assistant Surgeon. The latter lectures on Biology.

*St. Mary's Hospital.*—No changes have occurred at this hospital.

*Middlesex Hospital.*—The following changes have taken place during the past year :—Dr. J. K. Fowler has succeeded Dr. D. W. Finlay as Physician. Dr. Pasteur has succeeded Dr. Finlay as Lecturer on Medical Jurisprudence and as Lecturer on subjects relating to Public Health. Dr. F. Voelcker is Pathologist and Curator in the place of Dr. S. H. C. Martin. Dr. W. E. Wynter becomes Assistant Physician, and Mr. A. Pearce Gould is succeeded as Dean by Dr. Sidney Coupland. Messrs. Hartley and Wells assist in the Anatomical Department; Messrs. Young and Doblin assist in the department of Practical Physiology during the summer session.

At *St. Thomas's Hospital* considerable changes have again occurred. Death has removed no fewer than three members of the consulting staff, Sir James Risdon Bennett, F.R.S., Dr. Barker, and Mr. Le Gros Clark, F.R.S. Dr. Bristowe, F.R.S., having completed the additional term of office granted to him, retired in January, and the number of physicians is now again four. (There are still, however, only three assistant physicians.) Dr. J. F. Payne succeeds Dr. Bristowe as joint lecturer on Medicine in the school. Dr. Bristowe, Mr. Sydney Jones, and Mr. Croft have been placed upon the consulting staff. Mr. W. H. Battle and Mr. C. A. Ballance have been appointed assistant surgeons. Mr. F. C. Abbott takes the place of Mr. E. C. Stabb as Surgical Registrar, and Mr. E. H. G. Morris that of the late Dr. Charles Sheppard as Anæsthetist to the Dental Department. Dr. Sharkey succeeds to the lectureship on Pathology vacated by Dr. Payne on his appointment to the joint lectureship on Medicine. The school has to deplore the loss of Dr. A. J. Bernays, who died in January last, after a service of more than thirty years as teacher of Chemistry. He is succeeded by Mr. Wyndham R. Dunstan, with whom is associated Dr. Ince, who undertakes the practical teaching of Physics. Mr. F. G. Parsons has been appointed teacher of Elementary Biology. Mr. Stanley Kent succeeds Dr. Copeman, now an inspector under the Local Government Board, as Demonstrator of Physiology, and Dr. W. H. Tate has been appointed Obstetric Tutor and Registrar.

*University College Hospital* has to mourn the loss of its senior surgeon, Mr. Berkeley Hill, who had done much to promote its welfare. Mr. Marcus Gunn has been appointed Assistant Surgeon to the Ophthalmic Department. Dr. Mickle lectures on Mental Diseases; Professor Boyce on Bacteriology. Messrs. Weldon and Oliver give the instruction in Elementary Biology.

At the *Westminster Hospital* there have been no changes in the constitution of the staff. The changes in the cur-

riculum necessitated by the additional year's study had led to several alterations in, and additions to, the teaching staff of the school. Mr. D. S. Gunn has been appointed an additional Demonstrator of Anatomy, Mr. W. G. Spencer will take a definite share in the conduct of the Physiological Department, and Mr. Cowell will deliver the entire course of Lectures on Systematic Surgery. The subject of *Materia Medica*, or, as it is termed in the Regulations of the Examining Board for England, Practical Pharmacy is now separated from Therapeutics and Pharmacology, and whilst Dr. Murrell will continue to lecture on the latter subjects to senior students, the former is to be taken charge of by Mr. Tannor, the senior dispenser to the hospital. A special course of Lectures on Public Health will be delivered by Dr. S. A. Monckton Copeman, of the Local Government Board, instruction in Elementary Physics will be given by Mr. Somerville, B.Sc., and Dr. Donkin will hold a class in Elementary Practical Medicine.

*Royal Free Hospital.*—The only change in the medical staff during the past twelve months is that Mr. G. W. Farmer has been appointed Senior Resident Medical Officer in place of Mr. Solly, resigned.

*Mason College (Birmingham).*—The School of Medicine formerly in existence as the "Queen's College" has been transferred to the Mason College, of which, under the title of the "Queen's Faculty of Medicine," it will for the future form a constituent part. New buildings, including spacious dissecting-room, theatres and museums and other necessary offices, have been erected, and will be opened at the commencement of the winter session. Dr. Robert Saundby takes Sir W. Foster's place as co-Professor of Medicine. Dr. Carter succeeds Dr. Rickards as Professor of Therapeutics and Mr. Barclay has been appointed Lecturer on *Materia Medica*. Mr. Jordan Lloyd has been appointed Lecturer on Practical and Operative Surgery, Mr. Priestley Smith on Ophthalmology and Mr. Huxley on Dental Surgery and Pathology.

*Bristol Medical School.*—Important changes have been made to meet the requirements of the five years' curriculum. The winter session will be commenced in the new buildings just completed. Dr. Clarke takes charge of the department of Practical Physiology; Professors Leipner and Lloyd Morgan lecture on Elementary Biology.

At *Cambridge University* the buildings formerly occupied by the department of Human Anatomy have been altered and adapted for the classes in Medicine, Surgery, Practical Surgery, Midwifery and Medical Jurisprudence, and now constitute the School of Medicine. The new buildings for Anatomy and Physiology are now complete and contain a handsome suite of laboratories, dissecting-rooms, anatomical museum and rooms for private study and research. A special laboratory has been set apart for Psychological Physiology. Dr. Clifford Allbutt has been appointed by the Crown to the Regius Professorship of Physic, vacant by the death of Sir George Paget, K.C.B., and Dr. Donald MacAlister has been appointed his Assessor. Dr. Adami has been recognised as a Teacher of Pathology in association with Professor Roy. Mr. Deighton has been appointed a member of the Surgical Staff of Addenbrooke's Hospital. Mr. Acton assists in the department for *Materia Medica*, and Mr. Gardiner in that for Botany.

At the *Leeds General Infirmary*, in succession to Dr. Eddison, who has become Consulting Physician, Dr. Barrs and Dr. Jacob have been appointed Physicians, and Dr. Chadwick and Dr. Wardrop Griffith have succeeded them as Assistant Physicians. Mr. H. Secker Walker has been appointed Assistant Ophthalmic Surgeon and Assistant Surgeon in the Aural Department. Elementary Biology is taught by Professor Miall. Dr. Cohen has joined the Lectures on Chemistry.

At the *University of Durham College of Medicine* (Newcastle-upon-Tyne) Professor Arnison and Mr. Page take the

Demonstrations in Practical and Operative Surgery. Mental Diseases are taught by Dr. McDowall.

At *University College (Liverpool)* slight changes have taken place. Mr. Thomas is associated with Mr. Banks in the lectures on Descriptive and Surgical Anatomy. Mr. Kellett Smith takes the Anatomical Demonstrations. Dr. Herdman teaches Elementary Biology.

At *Owens College (Victoria University) School of Medicine* the following changes have been instituted. Professor Dreschfeld gives the course of lectures on General Medicine and is succeeded by Dr. Delépine in those on Pathology. Professor Perkin joins in the lectures on Chemistry. Professor Weiss lectures on Botany. Mr. Chalmers assists in the Anatomical Demonstrations.

At the *Sheffield School of Medicine* Dr. Arthur Hall has been appointed sole Lecturer on Physiology. Dr. Littlejohn succeeds Dr. Sidney Roberts as Lecturer on Forensic Medicine, and Dr. Rhodes has been appointed Demonstrator of Practical Pathology. Dr. Burgess lectures on Pathology during the summer session of the school. The lectures on Botany, Chemistry, Physics and Biology are delivered at the Firth College. Students are admitted under certain regulations to the practice of the Borough Fever Hospitals and of the South Yorkshire Lunatic Asylum at Wadley.

At the *University of Aberdeen* the changes are few. Dr. Finlay lectures on Medicine. Professor Niven teaches Natural Philosophy.

At *St. Andrews University* the only change to be reported is that Professor McIntosh lectures on Natural History conjointly with Professor Thompson.

At *St. Mungo's College and School of Medicine* the lectures on the Diseases of the Skin are now given by Dr. Alex. Morton, on Diseases of the Ear by Dr. J. Kerr Love, and on Diseases of the Eye by Dr. Wolfe.

At *Anderson's College Medical School* Dr. P. Caldwell Smith has succeeded the late Dr. Christie as Lecturer on Hygiene and Public Health. Professorships of Physics and Zoology and a Lectureship on Mental Diseases have been recently instituted. Dr. Freeland Ferguson lectures on Physics (winter and summer), Dr. George Bell Todd on Zoology (winter), and Dr. John Carswell on Mental Diseases (summer).

At the *Glasgow Western Medical School* there has been no change in the staff of lecturers, except that the post of Lecturer on Hygiene is at present vacant through the appointment of Dr. P. C. Smith to Anderson's College. Dr. A. B. Kelly has charge of the Throat and Nose Department and gives instruction in this branch.

At the *Dublin University* Dr. Brooks has succeeded Dr. Little as Joint Lecturer with Professor Cunningham on Descriptive and Surgical Anatomy, and also assists in the department of Practical Anatomy and Dissections. Dr. Purser lectures on Pathology, Dr. Bewley on Hygiene.

At *Queen's College (Belfast)* there is no change, excepting that Dr. W. H. Barrett lectures on Pathology.

At *Queen's College (Cork)* Dr. Aug. E. Dixon has succeeded Dr. Maxwell Simpson in the Lectures and Demonstrations on Chemistry.

At the *Dublin Royal College of Surgeons* there is some change to record. Professor Myles lectures on the Institutes of Medicine and on Pathology. Professor Auchinleck lectures on Medical Jurisprudence.

At the *Catholic University Medical School* the following changes have taken place during the year: The School has been incorporated under the Educational Endowment (Ireland) Act, and has got a new governing body and a board of visitors. A chair of Pathology and Bacteriology has been founded and Dr. McWeeney has been appointed to fill it. The School has been rebuilt and refitted during the past year and its working space has been almost doubled. A new Public Health Laboratory, in charge of Professor Roche, has been fitted up and opened for work; it is

the first laboratory of its kind established in connexion with a medical school in Ireland. Dr. Coffey assists Dr. Coppinger as Lecturer on Histology and Physiology. Dr. Birmingham gives the lectures on Descriptive and Surgical Anatomy, and is assisted in the Department of Practical Anatomy and Dissections by Drs. O'Carroll, Fagan and Dempsey. Professor Blaney has joined Dr. Sigerson in the Lectures on Botany and Zoology and Medicine.

*University of Edinburgh.*—There have been no changes in the medical department.

At *Queen's College* (Galway) Dr. Senier has succeeded Dr. Dixon in the Lectures and Demonstrations on Chemistry. He is also Joint Lecturer on Medical Jurisprudence. Dr. Lynham lectures on Pathology.

At *Glasgow University* there have been no changes in the professoriate during the past year.

*Dundee Medical School.*—The Council of University College has recently made certain appointments which mark a further stage in the progress of this School. Dr. MacEwan has been appointed Lecturer on Systematic Surgery; Drs. McLeod and Stalker, Lecturers in Clinical Medicine; Dr. MacEwan and Mr. Steele Moon, Lecturers on Clinical Surgery; and Dr. Rorie, Clinical Lecturer in Mental Diseases. Dundee is now, by its union with St. Andrews University, in a position to offer the complete curriculum necessary for the first two years of study in all the Scottish Universities.

## OPENING OF THE MEDICAL SCHOOLS.

### METROPOLITAN.

*St. Bartholomew's Hospital.*—The session will open on Oct. 3rd.

*Charing-cross Hospital.*—The term will commence on Monday, Oct. 3rd.

*Guy's Hospital.*—The session will begin on Monday, Oct. 3rd. The first meeting of the session of the Physical Society will be held on the evening of the same day in the Anatomical Theatre at 8 o'clock. The chair will be taken by Dr. Wilks, F.R.S. A. Ernest Maylard, Esq., B.S., of Glasgow, will read a paper on "How to Remain a Student through Life." There will be a house dinner of the Students' Club before the meeting. After the meeting the rooms of the club in the College will be open for the exhibition of instruments, microscopical preparations and photographs taken by members of the Society during the past year. All past and present students are invited to attend.

*St. George's Hospital.*—The winter session will commence on Saturday, Oct. 1st, with an introductory address by Dr. R. L. Bowles, at 4 P.M. For many years past the ceremony connected with the opening of the medical session has concluded with a dinner—a gathering of past and present students. The dinner on Oct. 1st will take place at the Hôtel Métropole, when Mr. T. Laurence Read will be in the chair. A large attendance is expected.

*King's College Hospital.*—The session will open on Oct. 1st. The old students' dinner will be held at Limmer's Hotel, Conduit-street, W., on Monday, Oct. 3rd, at 6.30 for 7 P.M. Professor I. Burney Yeo, M.D., has consented to preside.

*London Hospital.*—The session will commence on Monday, Oct. 3rd. The old students' dinner will be held in the College Library at 7 P.M.; the chair will be taken by Dr. Langdon-Down, Consulting Physician to the hospital.

*Middlesex Hospital.*—The winter session will open on Monday, Oct. 3rd, at 3 P.M., when an introductory address will be delivered by Dr. J. J. Pringle, which will be followed by the distribution of prizes awarded during the past winter and summer sessions by Sir Lionel M. Swineston Pilkington, Bart. The annual dinner of the past and present students and their friends will take place the same evening at the Holborn Restaurant at 7 o'clock. Dr. William Duncan, F.R.C.S., in the chair.]

*St. Mary's Hospital.*—The winter session will open on Oct. 3rd, at 4 P.M., with an introductory address by Dr. A. P. Luff. The annual dinner of past and present students will be held about the middle of October, on the same day as the laying of the foundation-stone of the "Clarence Memorial Wing" of the hospital by T.R.H. the Prince and Princess of Wales. The chair will be taken by Mr. H. W. Page.

*St. Thomas's Hospital.*—The winter session will commence on Monday, October 3rd, and terminate on March 31st. The prizes for the last session will be distributed by the Right Hon. Sir John Lubbock, Bart., M.P., D.C.L., LL.D., F.R.S., in the Governors' Hall at 3 P.M. During the afternoon the various departments of the hospital and school will be open for the inspection of visitors; refreshment will be provided in the library. The annual dinner, in which all past and present students are invited to join, will take place the same evening at the Hôtel Métropole, at 6 for 6.30 P.M., H. Laver, Esq., J.P., in the chair.

*University College.*—The session of the Faculty of Medicine will commence on Oct. 3rd, at 4 P.M., when the Dean's report of the past academical year will be read and an announcement of the scholarships and prizes gained by students during the year will be made, after which an introductory lecture will be given by S. J. Hutchinson, Esq., Dental Surgeon to University College Hospital. The annual dinner of the old and new students will take place at the Hôtel Métropole, at 6.30 P.M., Sir George Buchanan, M.B., in the chair.

*Westminster Hospital.*—The session will open on Oct. 3rd, at 4 P.M. Dr. Mercier, Lecturer on Neurology, and Insanity, will give the opening address. Sir Albert Rollit, M.P., will distribute the prizes, and the dinner will take place at the Holborn Restaurant.

*The Dental Hospital.*—The term will open on Monday, Oct. 3rd.

*The Royal Veterinary College.*—The session will open on Oct. 3rd. Introductory address by Prof. McFadyean, B.Sc., F.R.S.E. &c., at 1 P.M.

*The College of State Medicine.*—The winter session will commence on Wednesday, Oct. 5th, at 4 P.M. The introductory address will be delivered by Surgeon-General W. Robert Cornish, F.R.C.S., C.I.E., Q.H.P., Honorary Secretary and Treasurer of the College.

### PROVINCIAL.

*Mason College, Birmingham.*—The session will open on Sept. 30th. The opening address will be given by Sir George Humphry, M.D., F.R.S., F.R.C.S. Conversation in the evening, given by the President and Council of the College.

*Yorkshire College, Leeds.*—The winter session, being the sixty-second of the Leeds School of Medicine, will be opened on Oct. 3rd, when an address will be delivered and the prizes distributed by Professor W. Mitchell Banks of Liverpool.

*University of Durham College of Medicine, Newcastle-on-Tyne.*—The session will open on Oct. 1st.

*Firth College, Sheffield.*—The winter session will commence on Monday, Oct. 3rd, at 5 P.M., when the introductory address will be delivered in the lecture room of Firth College by Dr. Burgess, Lecturer on Pathology at the Sheffield School of Medicine and Senior Physician to the Sheffield Public Hospital and Dispensary. The annual students' dinner will be held some time during October.

### SCOTLAND.

*Aberdeen University.*—The term will commence on Oct. 11th.

*Edinburgh University.*—The session will open on Oct. 11th.

*Glasgow University.*—The winter session in the Faculty of Medicine will be opened on Tuesday, Oct. 18th, when an inaugural address will be delivered by Professor Cleland, M.D., LL.D., D.Sc., F.R.S., the subject being "Anatomy: its Place in Education."

*Anderson's College Medical School, Glasgow.*—The winter session will be opened on Tuesday, Oct. 18th, at 3 o'clock, with an introductory address by Professor William L. Reid, M.D.

*St. Mungo's College, Glasgow.*—The term will commence on Oct. 18th. An introductory address will be delivered by Professor McVail.

*Western Medical School, Glasgow.*—Oct. 18th. This school is to be opened with an address by the lecturer on Gynæcology—"Early Ovarian and Tubal Disease."  
*University College, Dundee.*—The session will open on Oct. 11th.

## IRELAND.

*Queen's College, Cork.*—The term will begin on Oct. 18th.  
*Queen's College, Belfast.*—The session will open on Nov. 3rd.

## THE CHOLERA.

---

### ENGLAND'S ATTITUDE IN FACE OF CHOLERA.

THE amendment of the cholera regulations which has been issued by the Local Government Board constitutes one of the most important steps hitherto taken towards preventing the entrance of cholera into this country. The regulations which have formerly been in operation, whilst requiring the detention of those actually sick of cholera or suspected to be so sick, have permitted the landing of presumably healthy people on condition that, where this was practicable, the names of such people, together with details as to their destination, should be given to the port sanitary authorities. And this scheme has hitherto sufficed. But the immigration of destitute Russian Jews into this country, which has now for some time past given much anxiety to the Medical Department of the Local Government Board, has, as a matter of fact, upset all previous experience. Until the present cholera prevalence such addresses as we refer to have been forthcoming, and the result has been that, without any undue restriction on the movements of hitherto healthy people into this country, persons who have come off an infected vessel have been kept under observation by the medical officers of health of the districts to which they have travelled.

But in the case of the Russian Jews such addresses are but rarely forthcoming, and hence a horde of destitute people have been settling down here and there in the worst parts of the East-end of London, and all traces of them have been lost immediately after they have been landed at the docks. In this way an essential feature of our English cholera regulations has been altogether defeated. This will now no longer be the case; for under the new regulations no persons will be allowed to land, whether from vessels certified to be either infected with cholera or to contain passengers who are in a filthy or otherwise unwholesome condition, unless they are able to satisfy the medical officer of health of the port as to their names, places of destination and addresses at such places. The effect of this regulation will be that if the shipping companies or their agents choose to bring a number of homeless and destitute people into our ports, they must be prepared to find that such people will not be allowed to leave the ships, and they will have either to make adequate provision for them on shore, or they will have to take them back again to the port whence they sailed. Few shipping companies will care to run this risk, and we may hope that the season for importing destitute aliens into the metropolis has now come to a close.

The attitude adopted by the Local Government Board in this matter is no new departure; it is simply an extension of the provisions, which altered circumstances have rendered necessary, for maintaining under observation for a reasonable number of days persons who, though at the time healthy, have been exposed to the risk of cholera infection and may be incubating the disease. And the need for such action has been very distinctly shown during the last few days. Cholera imported from Hamburg has spread out in fan-like form all down our Eastern coast. The arrival of a man at Grangemouth from an emigrant ship in the Firth of Forth was followed by his sickening of cholera after he had landed; two of a number of emigrants from Hamburg reached Glasgow and then fell ill of cholera; two similar cases occurred at Middlesbrough, one of the men being attacked at South Shields. At Hull and Liverpool suspicious cases traced to Hamburg ships have occurred; at Grimsby cholera cases from the same class of passengers have had to be isolated; and at Dover a sailing

boat brought one or two cases which, for some reason or other, after being allowed to remain in the bay instead of being taken to the authority's hospital, were sent round by tug to Gravesend, where they were, to say the least, in the best of hands, both for their own sakes and for the safety of the country. And the story of the London port is even more interesting. The *Gemma* arrived with Russo-Jewish emigrants, of whom three had cholera. The ship was not only detained off Gravesend by Dr. Collingridge, but that able health officer went on board, remained there three days and nights, removed the sick to the port hospital, and in the end landed the remainder of the almost homeless passengers under canvas on the shores of the Thames. His attitude throughout was energetic and wise; and we understand that the Local Government Board telegraphed to him their appreciation of the action he had adopted. The *Portia* next arrived, and although one child had been buried at sea, the nature of the disease could not be defined, and as the new regulations had not yet been issued she passed into London and her emigrants were distributed, with the result that at least one case of highly suspicious choleraic diarrhœa occurred amongst their number. Another vessel, the *Peregrina*, landed Hamburg passengers at Harwich. In two days three of them, who resided in the City-road, were found to be ill; two of them having cholera, they were removed to St. Bartholomew's Hospital, and one has died. In each of these cases the local health officers and officers of the Medical Department of the Local Government Board have done their utmost to deal with the occurrences in such a way as to avoid further spread, and thus far, notwithstanding multiple importations, no cholera has occurred in England except in persons actually arriving from Hamburg.

In the meantime it is satisfactory to know that long before any public alarm was aroused visits to our Eastern ports were being made by medical inspectors of the central authority, and that the port authorities were urged in advance to meet the very emergency that has arisen. Some of those ports, notably Newcastle and Hull, maintain themselves permanently ready to perform all their duties; in the case of others temporary arrangements have had to be made. In view of the extension of cholera to such French ports as Havre, the system of medical visits has been carried on at our south-eastern and southern ports, and as rapidly as can be managed the same system will be further extended to other ports having communication with infected ports. But, at the same time, it should be remembered that these visits in no way relieve port authorities from the obligation of performing duties which have for many years been imposed upon them, and of the nature of which they are perfectly aware. We believe the present state of affairs at some of our principal ports in the south of England to be highly discreditable. Mooring stations are not yet even determined on, no means of isolating first attacks of cholera have been provided, and the clamour is for outside and imperial help to make up for a default which elsewhere has been met by the action and at the cost of the port districts themselves. If this emergency passes by, as we hope and believe it will, we trust the interval of the next few months will be utilised to secure a state of preparedness for next year, which is very likely to bring with it dangers far in excess of any that we are running when cholera first reaches us towards the end of that season in which it has the best chance of spreading in our midst.

### PRECEPTS AND PRACTICE WITH REGARD TO CHOLERA.

On previous occasions cholera has commonly reached England and America *via* Persia, Russia and Hamburg, and not by the shortest, most direct and frequent channel of communication between India and this country—namely, *via* Egypt through the Suez Canal, and it has pursued this course at the present time. The epidemic has advanced by rapid strides. That it is governed by certain laws in its relation to season, time and space in its movement in different epidemics may be safely inferred. What has happened before in regard to it is likely to happen again and may consequently be predicated as probable. As to the exact nature of the occurrences which have taken place in France and their relation, if any, to the invading cholera of which we are speaking, there is some difference of opinion, but that need not detain us now. Let it suffice that what may be called the Seine or Paris epidemic began as a violent outbreak at the Nanterre prison

and asylum in April last, before the Asiatic epidemic had invaded Russia. The disease spread in the suburbs north and west of Paris and has extended to Havre.

The study of epidemic cholera as a branch of epidemiology is one thing and the study of the causes of its progress in relation to definite communities of human beings and its propagation among the series of units of which such communities are composed is another; and different conclusions will be probably reached according to the standpoint from which the observations are made. To the one set of observers a conviction of the existence of some primary law as yet unknown will be regarded as the paramount influence to which all other causes, real and alleged, are subordinate. To the local observer, however, proceeding by a slow and cautious induction and by way of accurate and repeated observations on a small scale, the cause of the phenomena will be differently accounted for; human agency will occupy the foremost place and be regarded as affording an adequate explanation of what is taking place on a large scale. The members of the profession likely to encounter cholera are meanwhile seeking for some firm foothold of fact and desirous of knowing how they may practically guide their way by the light of past experience and present knowledge interpreted by common sense and sound judgment.

It is difficult to lay down precise rules that shall be generally applicable or within reach of attainment by all. Still, there are certain rules and precautions about which most persons are agreed or in support of which a considerable amount of evidence might be adduced.

The first thing to be inculcated then is, in popular language, "not to lose one's head;" to avoid creating or adding unnecessarily to any existing state of apprehension and nervousness by any exaggerated or sensational statements. Let it be borne in mind that epidemics of cholera make little or no financial impression on life assurance offices. People who insure their lives are ordinarily frugal, temperate and careful people whose modes of living and surrounding conditions, both general and personal, are hygienic and wholesome. Such people do not commonly die of cholera. The fact furnishes a standard to be worked up to, although it is not, of course, always attainable.

The only real safeguard against cholera is sanitation in its broad as well as in its restricted and particular sense. First and foremost, a pure water-supply; next, good air and free movement of it, cleanliness, wholesome food, a temperate life, and the avoidance of all overcrowding. Dirt and refuse of all kinds should be at once removed, drains and sewers thoroughly flushed, cisterns inspected and cleaned if necessary, windows kept open and walls whitewashed; but it is important to avoid all sloppiness of yards, floor surfaces and damp earth. If the drinking water is not of established purity it is imperative to boil it before use, and milk should be similarly treated when it comes into the house. In respect of sanitation, it may be fairly said that great progress has been made of late years, and our prospects, in the event of the occurrence of an epidemic this year or next, should consequently be better than they have ever before been.

Land quarantine and sanitary cordons are impracticable and consequently futile. Sanitation and the removal of filth are practicable and reliable measures, and their utility is not limited to cholera, but applicable to all diseases.

The steps that have been taken at the instigation of the medical advisers of the Government seem to us to have been wise and judicious and likely to achieve their aim and object without any needless and unnecessary hardship being inflicted on individuals, and our port and other sanitary officers have exercised, and are still exercising, the most vigilant supervision within their own respective spheres of work.

During the prevalence of epidemic cholera it is safest to regard the human constitution as in a state of unstable equilibrium, and consequently to avoid everything that would lower the health, especially everything that would tend to create indigestion or diarrhoea, and not to make it the occasion for instituting any radical change in life or habits.

When cholera or choleraic disease is present in any town or district it is safer to leave it, and for persons living in a low and crowded locality to move to the highest and most exposed site available, and above all to avoid overcrowding. It must not be forgotten that overcrowding of houses or people means danger during all times of epidemic disease; that persons coming from an infected district, if they bring nothing else bring themselves, and at any rate add to the danger by adding to the numbers. A number of immigrants arriving from an infected district—possibly dirty as regards their

persons, and still more so as regards their clothes—may be provisionally regarded as so many minute migratory fragments of the locality whence they came.

On the occurrence of cholera in a household the safest plan no doubt would be to vacate the house and leave it unoccupied for ten or more days, during which it should be disinfected and thoroughly cleansed and ventilated. As regards the prophylactic and therapeutic treatment of cholera, we would suggest the expediency of having an acidulated beverage for ordinary household consumption when the disease is actually present in the neighbourhood. A drink composed of previously boiled water well acidulated with sulphuric acid or with citric acid, and slightly sweetened, is an excellent one and not at all distasteful. We do not know that it has ever been practised, but the effect of a few grains of quinine daily as a prophylactic might, perhaps, be worth trying.

It is safer to regard all diarrhoea at such times as possible cholera and to act accordingly, taking steps for its speedy detection and treatment, for the sufferers are frequently apathetic with regard to it. The patient should be at once placed under medical observation and remain recumbent in a cool room. Provided it were from the first painless and not the result of indigestible food or due to some irritant, when a small dose of castor oil with or without some opium would be indicated as the remedy, it is best to try to stop it, and, if the stools are very loose and attended with depression, to at once use a hypodermic injection of morphia and atropia, administer a mixture of either aromatic sulphuric acid or sulphurous acid frequently in small doses, with a little iced beef-tea or beef-juice or iced whey, and fragments of ice to suck, together with some stimulant or not, as deemed advisable. In a very considerable number of cases the adoption of this or of some similar method of treatment would prove successful, if commenced at once. But it cannot be too well known that the effect of opium or of opium and brandy appears to be very injurious in cholera when collapse has supervened. The number of remedies that have been proposed for this disease has been legion, and the fact itself demonstrates that there is no really efficacious remedy. The administration of drugs in cholera collapse seems to be based upon a misconception of its true pathology. That they are often administered with real or apparent impunity only serves to indicate that they do not act because they are either speedily vomited or not absorbed if retained. In cholera collapse the whole system is profoundly altered. Absorption is arrested, owing probably to the loss of inhibitory functions of the ganglionic nerve centres; exosmosis is proceeding unintermittently, endosmosis reduced to *nil*.

Speaking roughly, the actual attendants on cholera cases do not apparently run any greater risks than other individuals exposed to similar local influences in the place or district in which the disease happens to be prevailing at the time. The great thing to be observed is perfect cleanliness. A wise caution suggests what is the common practice—viz., the lavish use of disinfectants for all excreta and fouled linen, and the burning of all such articles as cannot be promptly disinfected; moist heat and the use of the perchloride of mercury solution, or, when this might prove dangerous, strong solutions of carbolic acid, chloride of lime, or other approved disinfectants, being employed for the purpose. The washstands in the sick room or ward should be supplied with some disinfectant solution, and a ball of sand soap and one of carbolic soap, with nail-brushes, for use invariably before quitting a cholera ward or patients suffering from the disease.

#### REPORTS FROM THE LONDON HOSPITALS.

We have made inquiries at all the London hospitals, asking for information regarding any cases of cholera which have been treated during the past week at these institutions. We have received returns from all the hospitals to which we have applied, and it appears from them that with the exception of St. Bartholomew's Hospital no case of cholera has been treated during the past week in the metropolis.

From St. Bartholomew's Hospital we are supplied by Dr. Frederick E. Batten, house-physician, with brief notes of two cases which were admitted to this hospital on Aug. 30th under the care of Dr. Lauder Brunton. The first patient, aged thirty-five, a male, left Hamburg on Saturday, Aug. 27th, accompanied by his wife and child, landing at Harwich on Monday, Aug. 29th. They came to London, and on Monday evening at 9 p.m. the patient was suddenly taken ill. The symptoms of his case were profuse diarrhoea with pains in the back and severe cramps in his legs. He was removed on Tuesday morning, Aug. 30th, to St. Bartholomew's

Hospital and was received there in a very collapsed condition. He showed signs of slight improvement, but died suddenly at half-past three o'clock on Wednesday morning, Aug. 31st. The second case was that of the daughter, aged three, of the above-mentioned patient. The little girl was taken severely ill on Tuesday morning with frequent diarrhoea and vomiting. When admitted on Tuesday morning, Aug. 30th, she was much collapsed; she improved, however, after a few hours' treatment, and remains at present in the same improved condition, and she may recover. Neither of these cases, it may be remarked, presented *all* the distinctive features of Asiatic cholera.

A case occurred at St. Thomas's Hospital which excited considerable anxiety on Thursday last, Aug. 25th. We are supplied with the following details by Mr. Cecil Lalor, acting resident assistant physician. A female patient, very much collapsed, was brought from a cab into the casualty room suffering from severe cramps in the legs and arms. Whilst being examined the patient vomited. She remained perfectly conscious and clear-headed. It appears that the patient up till 4 o'clock of that afternoon had been in her usual state of health. She was seized suddenly. On the following morning she was doing well, but passed no urine for twenty-four hours. Her bowels had not been opened for two days. She was then given an aperient, the resulting motion being loose; otherwise normal. She has had no further symptoms.

There is no further evidence of any suspected case in any of the London hospitals.

#### PREPARATIONS IN CASE OF NEED.

Most of the hospitals, however, have been preparing proper accommodation for the reception of cholera cases. The London Hospital, being in the centre of the district in which immigrants usually settle, is likely to be the first to which cases of cholera are brought, and the managers, being thoroughly alive to the necessity, have made ample provision for the reception and efficient treatment of cases. A ward conveniently situated for the separate treatment of cases has been got ready for males and one for females affording accommodation for twenty cases, and provision has been made for allotting more wards if necessary. The members of the medical staff attended on Tuesday at the meeting of the House Committee, and it was decided that all cases strongly suspected of being cholera should be sent to the ward prepared for the purpose. Infected clothes &c. will be burnt. Tow, hay and straw are provided for the reception of the stools of cholera patients, and after being placed in suitable receptacles will be disinfected with dry disinfectants and burnt in the furnaces. The sanitary arrangements of the hospital are stated to be now completely remodelled on the most approved system.

#### REPORTS FROM SEAPORT TOWNS.

Further, we have ascertained from the medical officers of health at the various ports stated to have been visited by cholera that at Hull, at Dundee, at Gravesend and at Newcastle-upon-Tyne no cases of cholera have occurred. The medical officer, Dr. J. H. Gramshaw, informs us "that no case of cholera has been reported at Gravesend, that the health of the town is excellent, and even diarrhoea, except in the case of a few infants, is almost unknown. The three cases from the *Gemma* were landed at the Port Sanitary Hospital at Denton, below Gravesend, and were never in the town at all. After death they were carried by a circuitous route to the cemetery on the outskirts of the town, and then buried with proper precautions with regard to disinfection. The two subsequent cases from the *Helena* were landed at the same place and there remain. One of them is, I understand, a doubtful case of cholera, and the other has passed the choleraic stage and is now suffering from the subsequent fever, and is very ill. All necessary and prudent steps have been taken here. Our town is as clean and healthy as it is possible to be. The medical men have been called together to meet the Corporation, and their suggestions have been carefully considered and attended to as far as possible when within reason. The sensational paragraphs which are spread abroad are mostly untrue, and if a grain of truth is found in any they are so exaggerated as to be ridiculous."

In Liverpool Dr. Stopford Taylor, the medical officer of health, is away on his holiday, but will return this week. His place has been well filled by Dr. Hope, who deserves every credit for the promptitude with which the few cases which occurred have been detected and isolated. They were found in a lodging-house, having come from abroad. The symptoms being suspicious the patients were removed to the Parkhill Hospital, the one provided for cases occurring in the

city. Cases brought by vessels in the Mersey will be sent to the hospital at Bromborough on the Cheshire side. Up to the morning of Aug. 31st one death had occurred.

We are informed that in South Shields a case of cholera was notified in that town on Aug. 29th. The patient was one of the crew of the ss. *Gerona*, which arrived in Middlesbrough on the previous Friday. Some six of the crew came to South Shields on the Saturday, but up to Aug. 31st the other five are well. The man was suddenly seized on the Sunday with violent diarrhoea (fourteen motions), abdominal pain and cramps in the legs, vomiting and prostration. The surface temperature was subnormal, but there was no lividity or collapse. The motions were not characteristic, but continued throughout of a yellow colour. Next day he was a good deal better, his diarrhoea had almost ceased, and he had no pain. On Wednesday, Aug. 31st, his temperature and pulse were normal; he slept well and his appetite had improved. There was considerable doubt about the diagnosis; but in view of the fact that the ship came from an infected port (Hamburg) and that another case was reported to have died on the ship, all precautions were taken as though it were an undoubted case of cholera.

#### CHOLERA IN SCOTLAND.

Regarding cholera in Scotland we have made inquiries at Dundee and the medical officer informs us that no case of cholera has come under his notice at that port.

We are indebted to Dr. James Allan, superintendent of Belvidere Hospital, Glasgow, for the following notes of cases which have occurred in that institution:—"There are at present two cholera cases in Belvidere. The patients (a man and a woman) are Russian (Jew) emigrants, who reached Glasgow by Hamburg and Leith. The male patient was admitted to hospital at 1 o'clock on the morning of the 27th ult. I saw him with Dr. Watson, one of my assistants. The patient's appearance was a confirmation of the diagnosis (cholera). The pinched face, the cold, dark, shrunken hands, which were feebly tossed about, and the husky, moaning voice conveyed a sufficiently dismal impression. He had a motion which was reported by the nurse as like milk. Without going into detail, it may be said that the man had very scanty urine (practically suppression) and that the urine was albuminous. He had also vomiting, a miserable pulse and subnormal temperature. When reaction set in the man's face had a dull-red flush and his pulse altered its character; he had hicough. This patient is apparently going on to convalescence. The woman was admitted here at 9.55 A.M. on the same date (27th ult.) and was evidently suffering from the same disease. She looked wretched. Her hands were cold and somewhat shrunken, her voice husky and hollow, her temperature subnormal. Alvine evacuation like milk. In this case also reaction has taken place. I placed Dr. Parker (one of the assistant medical officers) in charge of the cholera patients, relieving him of all other duty. The treatment has been chiefly iced water, sulphuric acid and opium, brandy &c. Careful precautions are being taken in the way of cleanliness, disinfection &c. Three nurses belonging to our staff have been set aside to attend on these cases, a duty which they undertook without the slightest hesitation—nay, with alacrity."

#### SANITARY PRECAUTIONS AT SEAPORTS.

The port sanitary authority of the river Tyne has caused all vessels from infected ports to be boarded on their arrival, and the crews and passengers to be medically examined. At this port Dr. Armstrong has been supplied with an additional assistant medical officer, who is stationed at the mouth of the river for this purpose, on duty day and night. Elaborate regulations have been issued by Dr. Armstrong to inspectors.

The medical officer at Hull states that all vessels arriving from the Continent are medically inspected immediately upon arrival in the roads, special attention being directed to those vessels from Hamburg and other ports where cholera is prevalent. Dr. Mason relies not only on inspections in the river as the first line of defence, but considers that in the short passage between Hamburg and adjacent ports there is the probable danger of cases of cholera developing on board vessels after arrival. Masters of ships must not take in any drinking water at a cholera-infected port; and the crews should confine themselves as much as possible to the vessel; when such water is found to have been taken in, it is ordered to be thrown overboard before the admission of the vessel into dock. Precautions are also directed to the removal of all bilge water and the cleansing of waterclosets. Dr. Mason is of opinion that this should be made compulsory on all masters, together

with the power of detention for medical inspection. Similar stringent measures have, by order of the Local Government Board, been adopted at other British ports. We have elsewhere alluded to the unsatisfactory state of affairs at some of our principal ports on the south coast. We trust that this will be remedied without delay.

## THE CHOLERA IN BELGIUM:

### A VISIT TO JUMET.

(FROM OUR SPECIAL CORRESPONDENT.)

FROM Brussels to Jumet it is necessary to take the main line towards the French frontier in the Charleroi direction till the junction of Luttre is reached, and there a local train conveys the traveller to Jumet-Brûlotte. On descending here I soon perceived that Jumet, though it appears in the demographical weekly reports as one place, with a population of 24,259, is in reality a small country consisting of a dozen or more villages. These villages sometimes touch one another, and it is difficult to say where one begins and the other ends. Elsewhere they are separated by a broad expanse of cultivated land.

The young son of Van Esbercq, a youth about nineteen, fell ill, and the father, alarmed, determined to accompany him home so that he might be nursed by his mother, who had remained at Jumet to take care of their cottage. The youth arrived at Jumet on Aug. 13th; he was suffering from violent cramps, vomiting and diarrhoea. The father went back to work at Sarcelles. On the night of Aug. 17th the father fell ill. His fellow workers had to take the mattress on which he slept and place it outside the overcrowded and stifling hut in which they were herded together. On the evening of the 18th Van Esbercq determined to return home. He travelled all night, was extremely ill on the way, with vomiting and violent diarrhoea, notably at the station of Creil while waiting to join the main line train. He arrived at Jumet at five o'clock on Thursday morning and died at 2 A.M. on Saturday morning, Aug. 20th. Van Esbercq's son-in-law and his little daughter, a girl of about twelve years of age, were also ill. All the seven members of this family returned to Jumet, together with many other brickmakers, who were so alarmed by the amount of sickness and the number of deaths at Sarcelles that they preferred losing the season to risking their lives in such a place. Yet this sudden departure has involved these workers in a serious loss. It is too late, in the brickmaking season, to obtain employment elsewhere, and they have not worked long enough in the neighbourhood of Paris to cover the expenses of the journey and put by a provision for the winter months.

Van Esbercq's cottage is situated on the crest of a hill. His midden-closet is in a yard behind, some ten feet lower than the street level in front of the cottage. To reach the latrine he had to go down dark steps and pass by a cellar which is under the cottage. In this cellar is the well. The inhabitants say it is seventeen yards deep from the level of the street; in any case, the water is at a much lower level than the midden or ash closet above used by the cholera patients. On the other side of the road is a large square block of houses, and at the angle of this block building, just facing Van Esbercq's cottage, there is another very deep well. Though this building is a little above the level of Van Esbercq's cottage, the well, which supplies drinking water to the whole of the inhabitants, certainly goes below the level of Van Esbercq's cottage and his latrine. It is in this block of houses that four cases and three deaths occurred. The victims—a widow and her daughter in one tenement, and two children in another tenement—had not come from Paris, but they were taken ill after the Van Esbercqs returned from Paris. In the same block of buildings there is a bakery and the water used in making the bread is taken from the well in question. I understand that samples of this water have been secured for analysis, and the well has within the last day or so been repaired.

A few yards higher up than this block building I called on a man who lived in a small cottage. He said that before Van Esbercq died, but after the return of Van Esbercq's son to Jumet, he was seized with violent cramps, diarrhoea and vomiting. He added that his skin became icy cold and of a

bluish colour. I asked him if his cottage had been disinfected. He showed me a bottle which had contained about half a pint of a disinfectant. This had been given him and this is all that had been done. The man had been taken ill while working in a coal mine and was so bad that it was necessary to send him up at once to the surface. In the opposite direction, and lower down than Van Esbercq's cottage, I saw a young mother who had lost her child four months and a half old after two days' illness. I could get no clear description of this illness beyond the fact that the child was evidently in great pain, vomited violently and had excessive diarrhoea. The woman drank water from a well built in the cellar underneath her house and had had no disinfectants whatsoever supplied to her. Probably this was only a case of infantile diarrhoea; but under the present menacing circumstances it struck me that disinfection, even where it is not needed, would be, if a mistake, still a mistake in the right direction.

Jumet, Aug. 30th.

### THE ALARM IN BRUSSELS.

P.S.—On my return from Jumet I find Brussels in a state of alarm, the newspapers having stated that four cases of cholera had occurred in the capital. Two of the patients had been transported to the St. Peter Hospital. The first was a man who had come from Paris, and was suffering from a form of skin disease. During the night he was attacked with violent vomiting, and died suddenly. Somewhat carelessly, apparently, the death was declared to be due to cholera. The bedding, linen &c. were immediately burnt, and all the surroundings washed with a strong mercurial solution. The body was taken to the cemetery and a post-mortem examination held this morning. I have just seen the certificate. There were some *lésions spéciales intérieures*, but *aucune lésion du choléra*. In any event, cholera or not cholera, the man came from Paris, and therefore at the worst it is but an imported case. The other case is that of a man who is now recovering. He suffered from violent diarrhoea, but the medical attendants declare that there were no special symptoms of cholera. Nevertheless the patient has been removed to the hospital and his room disinfected, and every precaution taken, just as if it was a *bonâ-fide* outbreak of cholera. The two other cases occurred not in Brussels, but in the suburb of Schaerbeek. A woman and child arrived from Paris; the woman is dead, the child ill. From all accounts these two are genuine instances of cholera imported from France.

Brussels, Aug. 31st.

We are glad to notice that some suggestions we made last week have been adopted without delay. A lecture to nurses on the nursing of cholera and the precautions to be taken in dealing with this disease was given by Dr. Heron on Thursday at the offices of the Royal British Nurses' Association. The lecture will be repeated on Monday, Sept. 5th. As Dr. Heron has had practical experience of cholera and has contributed some valuable papers to the literature of the subject, it is probable that many nurses will avail themselves of the opportunity. The lectures are open only to nurses, and the secretary (8, Oxford-circus-avenue) will give all necessary information. H.R.H. Princess Helena, President of the Association, asks us to make known that they are "now enrolling nurses who are willing to devote themselves to the care of patients who may be seized with cholera, and to obey the call of duty at a moment's notice."

In view of the fact that a number of steamers arriving from Hamburg have taken Hamburg water on board, the Local Government Board have issued an order enabling port medical officers of health to require such water to be got rid of before the vessels enter docks; the port authority to provide an alternative supply for immediate domestic uses. Bilge water must also be pumped out.

We understand that Her Majesty the Queen is evincing the greatest interest in the action which is being taken by the Local Government Board, by port and local authorities, to prevent the spread of any cholera which may be imported into this country.

Our Berlin correspondent informs us that the Medical Board of Hamburg published the following figures in reference to deaths from cholera from Aug. 18th till noon of the 23rd:—"The cases of cholera-like disease numbered 219, and the deaths 75. Dr. Koch, who visited Hamburg, declared that the character of the disease justified the gravest anxiety. The Hamburg American Steam Packet Company ordered its large double screw steamers not to come to Hamburg, but to ply between Southampton and New York. It also refused to carry steerage passengers on board its other steamers till further notice. The Heligoland steamers were ordered not to come to Hamburg, but to ply between Cuxhaven and the North Sea watering-places. Seventy-six cases of cholera-like disease with 46 deaths occurred in Hamburg in the afternoon of Aug. 23rd, 188 with 32 deaths, on the 24th; 295, with 130 deaths, on the 25th. The Senate ordered all the schools in the city and the territory belonging to it to be closed, forbade public dancing, and licensed all keepers of hotels and restaurants and sellers of liquors in the streets to sell cognac *ad libitum* till the 20th prox. The Water Committee has threatened penalties for waste of water. On the 26th 416 cases and 150 deaths were reported. Many families have left the city. Charitable people have distributed disinfectants, cognac and medicines gratis. Private equipages, furniture vans and bakers' waggons are used for the transport of patients and corpses. Yesterday the representatives of the citizens unanimously granted half a million marks (say shillings) for the eradication of the epidemic. Senator Bachmann, chief of the police, stated that the total number of cases till noon yesterday had been 3400, the number of deaths 1070. The Medical College of Bremen stated yesterday that among the sixteen cases of cholera-like disease that had occurred there not one case of Asiatic cholera had been detected. Only one case of cholera has as yet been detected at Berlin, that of a woman from Hamburg. The Emperor is taking a keen interest in the conflict with the formidable enemy. It is probable that a Bill for the warding off of infectious diseases will be laid before the Reichstag next session." The meeting of the German naturalists and medical men, which was fixed to take place at Nuremberg on the 12th prox., has been postponed till next year owing to the cholera.

Our Paris correspondent supplies us with the following account of the precautions which have been adopted in France in reference to the cholera:—"At all the frontier railway stations, from Dunkerque to Delle, every France-bound train will be stopped and each passenger examined. Such passengers as are recognised to be suffering from cholera will be promptly isolated in a special building, while suspicious cases will be detained in another building, from which they will only be allowed to proceed after the medical officer has certified their immunity from all cholera germs. Passengers in good health will be allowed to continue their journey on the condition that they declare their destination. A passport, bearing the enumeration of the penalties incurred by any infringement of the regulations, is then delivered to such a passenger, and the mayor of the commune in which he is to reside will, having been informed of his arrival by letter, keep him under medical observation for five days. At all frontier stations all the luggage will be examined by the Customs officials. Any soiled linen found will be rolled up into numbered bundles and then submitted to disinfection in high-pressure ovens. The medical examination and the disinfection of the linen will only entail a maximum delay of forty-five minutes. The above measures will also be applied at all seaports. Paris continues to compare favourably, from a sanitary point of view, with the above-mentioned towns. Since the 21st ult. no recrudescence of the malady had been noted at the Hôtel-

Dieu, where a special service under Professor Proust has been organised. A contradiction is given in *Lo Temps* of Monday to the rumour circulated by one of our morning contemporaries of the existence of cholera at Aix-les-Bains. It is said that not a single case has broken out there."

## Medical News.

WE regret to announce that Sir George H. B. Macleod died suddenly on Wednesday morning at his residence, 10, Woodside-crescent, Glasgow. Owing to the crowded state of our columns we reserve a fuller account of this eminent surgeon for our next issue.

WE have regretfully to record the death of the distinguished alienist, Dr. William Wood, F.R.C.P. Lond., of Harley-street, consulting physician to St. Luke's Hospital. Dr. Wood, who passed away on the 28th ult., at the age of seventy-five, was a frequent contributor to medical literature in the domain to which he devoted his attention.

THE ACCIDENT TO MR. GLADSTONE.—As the accident which happened to the Premier on Monday, the 29th ult., has given rise to much anxiety in the public mind, we are glad to be able to state on authority that the right hon. gentleman was able to walk home after the accident, and has suffered no ill effects from it beyond experiencing slight stiffness on the following day.

MIDWIVES' REGISTRATION.—The Select Committee appointed by the House of Commons to consider the question of the compulsory registration of midwives have published their report. In view of the evidence the Committee consider that some legislative provision for improvement and regulation is desirable, and that in connexion with parish infirmaries and home practice there is a wide field, at present unused, for training in midwifery. The Committee recommend a continuation of the inquiry in the next session of Parliament. We propose in our next issue to give a digest of the evidence of the various witnesses who have appeared before the Committee.

## Births, Marriages and Deaths.

### BIRTHS.

- SHACKEL.—On Aug. 26th, at Ludlow, Salop, the wife of G. A. Shackel, I.R.C.P., M.R.C.S., of a daughter.  
TURNER.—On Aug. 29th, at Finsbury-square, E.C., the wife of F. Charlewood Turner, M.D., of a son.

### MARRIAGES.

- HUNT—MAJOR.—On Aug. 24th, at the Parish Church, Penn, near Wolverhampton, by the Rev. C. H. Cole Webb, Vicar, assisted by the Rev. William Warner, Christchurch, Oxford, Arthur Henry William Hunt, M.R.C.S., L.R.C.P., eldest son of Capt. H. Hunt, Lincoln, to Hilda Winifrede, fourth daughter of J. C. Major, Esq., J.P., the Bhylls, Wolverhampton.  
PRITCHARD—MCKAIN.—On Aug. 26th, at the Parish Church, Goldborough, Yorkshire, by the Rev. W. J. McKain, Rector of Parham, Sussex, brother of the bride, assisted by the Rev. J. Harrison, Vicar of St. Mark's, Dowsbury, James Joseph Gauler Pritchard, L.R.C.P., M.R.C.S., of Dowsbury, elder son of the late C. A. Pritchard, Paymaster in Chief, R.N., to Edith, daughter of William Fergus McKain, Esq., of Spring Grove, Isleworth, late of Her Majesty's Civil Service.  
SIBLEY—BUTLIN.—On Aug. 26th, at St. Mary's, Liscard, Cheshire, Walter Knowsley Sibley, M.A., M.D., B.C. Camb., M.R.C.P. Lond., of 7, Harley-street, Cavendish-square, W., eldest son of S. W. Sibley, F.R.C.S., of Whitehill, Hetchingley, Surrey, to Georgie Marie Butlin, late of the Lovick Institute, Paris, only daughter of Captain G. Butlin, late of the Royal Navy, and of Mrs. M. Butlin of Belfast.  
SIMMONS—LEVI.—On Aug. 4th, at Cape Town, South Africa, Frederick H. Simmons, M.R.C.S. Eng., &c., to Jennie, only daughter of the late Joseph Levi, of London.

### DEATH.

#### IN MEMORIAM.

- WAKLEY.—On Aug. 30th, 1892, at Heathlands-park, Longcross, Chertsey, Surrey, James Goodchild Wakley, M.D., for twenty-five years Editor of THE LANCET, youngest son of the late Thos. Wakley, M.P.

N.B.—A fee of 6s. is charged for the Insertion of Notices of Births, Marriages, and Deaths.

**METEOROLOGICAL READINGS.**

**OUR CURRENT NUMBER**

Being almost exclusively devoted to information especially interesting to Students, we are necessarily compelled to defer the publication of communications on other important subjects.

We tender our best thanks to those gentlemen who have kindly supplied us with the returns and prospectuses upon which the information given in this Students' Number of THE LANCET relative to the various medical examining bodies, hospitals, and medical schools of the United Kingdom is based.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. F. P. Atkinson, Surbiton; Mr. Arrowsmith, Bristol; Messrs. Armour and Co., London; Mr. J. Bradface, Edinburgh; Dr. C. A. Bontor, Great Berkhamstead; Dr. M. Mitchell Bird, London; Messrs. Barker and Sons, London; Dr. A. M. Bolton, Roumania; Messrs. Bengier and Co., Manchester; Mr. Brasier, London; Dr. Benson, Pinner; Mr. T. B. Browne, London; Mr. Brooks, Nottingham; Mr. J. E. Cooney, Fulham; Mr. Clarke, London; Mr. E. Colson, Jersey; Messrs. Clay and Sons, London; Dr. Chavasse, Birmingham; Mr. Conant, Chicago; Mr. Cornish, Manchester; Dr. Currie, Algiers; Messrs. Douglas and Mason, Edinburgh; Mr. Duncan, Newcastle-on-Tyne; Mr. Clement Dukes, Rugby; Mr. W. A. Davidson, Leighton; Messrs. Deacon and Co., London; Mr. Ellis, Newcastle-on-Tyne; Messrs. Edgington and Co., London; Mr. F. Ensor, Port Elizabeth; Messrs. Fannin and Co., Dublin; Mr. E. H. Fenwick, London; Mr. George Foy, Dublin; Mr. Greenwood, Kent; Mr. Godson, Redditch; Mr. Graeforex, London; Dr. A. B. Harris, Falmouth; Mr. S. C. B. Hunter, Bristol; Mr. J. P. Henry, London; E. L. Hughes, London; Dr. G. W. Herschell, London; Mrs. L. S. Harris, Matlock; Dr. Harris, London; Mr. Hargreaves, London; Mr. Hyde, Buxton; Mr. Heywood, Manchester; Mr. Harker, Bournemouth; Messrs. Humphreys, London; Mr. Hallet, London; Dr. M. Jones, London; Mr. Jackson, London; Mr. Keely, Nottingham; Mr. W. T. Little, Maidstone; Mr. Lintern, Ivy Bridge; Mr. Lester, Hitchin; Mr. W. Lawley, London; Mr. Lamond, Glasgow; Mr. Lewis, Birmingham; Mr. Menzies, Surrey; Dr. McRitchie, Huntingdon; Mr. McEhatrick, Mere; Mr. Myers, London; Dr. Murray MacFarlane, Toronto; Dr. Milton, Cairo; Dr. J. C. M'Givan, Derby; Mrs. Norris, West Hampstead; Mrs. Ogston, Walker-on-Tyne; Messrs. Oliver and Boyd, London; Mr. O'Flaherty, Dr. J. A. Ross, Folkestone; Mr. G. A. Roberts, London; Mr. J. G. Reynolds, Wolverhampton; Messrs. Robertson and Scott, Edinburgh; Mr. Russell, Liverpool; Messrs. Riddle and Co., London; Mr. Rolls, Weymouth; Mr. Spencer, Devonport; Mr. Sell, London; Messrs. Street and Co., London; Mr. Startin, London; Messrs. Swan

Sonnenschein and Co., London; Messrs. Seear, Hasluck and Co., London; Mr. Setley, Leamington; Dr. J. C. Steele, London; Dr. Octavius Sturges, London; Dr. A. P. Sherwood, Eastbourne; Dr. J. Mackay White, Dundee; Mr. W. R. Williams, Preston; Miss Walker, Buckingham; Mr. Wilkes, London; Mr. Whitwell, Thaxted; Messrs. Whitworth and Stuart, Manchester; Mrs. Walker, Buckingham; Dr. Ward, Oxford; Mr. Williamson, Manchester; Alpha, Liverpool; Afrassin, London; Boz, London; Clavicle, London; Dear Food; Energy, London; G. S., Seething-lane; Glaucus, London; Jays's Sanitary Co., London; J. P. T., London; Maltine Manufacturing Co.; North Wales Guardian, Wrexham; Nucleus, London; Pond's Extract Co., London; R. K., London; R. H.; Sanitas Co., Bethnal-green; Secretary, University College, Dundee; Secretary, Ancoats Hospital, Manchester; Secretary, Derbyshire Royal Infirmary; Spes, London; T. W. H., London; Vaccinator; W. A., London; X. Y., London.

LETTERS, each with enclosure, are also acknowledged from—Mr. Aldridge, Southampton; Miss Austin, Great Yarmouth; Mr. Abbott, Tunbridge Wells; Mr. Arnett, Tenby; Dr. Baxter, Bromley; Messrs. Blake and Co., London; Mr. Bennett, Denmark-hill; Mr. Bowen, Carnarvonshire; Mr. Buck, Hyde; Mr. Balmford, Morecambe; Mr. Birkenhead, Banbury; Dr. Croke, Beverley; Mr. Coates, London; Mr. Cassidy, Lancaster; Mr. Chrispin, Featherstone; Mr. Cornish, Birmingham; Mr. Cawston, London; Mr. Davey, Islington; Mr. Davidson, West Ham; Mr. Darville, Buntingford; Dr. Delaney, Stratford; Mr. Eden, St. Clears; Messrs. Eason and Son, Dublin; Mr. Fiske, Maidstone; Mr. Gwynne, Bangor; Mr. Gilyard, Bradford; Messrs. Howlett and Son, London; Mr. Holst, Bath; Mrs. Hitch, Hastings; Mr. Heanen, co. Armagh; Mr. Hughes, Pwllheli; Mr. Hedden, Bideford; Mr. Hatton, Edenbridge; Mr. Hale, Chesterfield; Messrs. Hooper and Co., London; Mr. Hornbrook, London; Mr. Illingworth, Accrington; Mr. Jones, Penygroes; Mr. Joyce, co. Donegal; Mr. Kitson, Rockheave; Messrs. Keen, Robinson and Co., London; Mr. Lloyd, Ammanford; Mr. Lawrie, Weymouth; Mr. Leech, Bury St. Edmunds; Mr. Munncliffe, Gosport; Mr. Myers, Birmingham; Messrs. Mann and Son, London; Mr. Merry, Hemel Hempstead; Messrs. NOTICE.—Advertisers are requested to observe that it is contrary to the Postal Regulations to receive at Post Offices letters addressed to initials only.

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only a ready means of finding any notice, but is in itself an additional advertisement. Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance. Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET. Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisemen's are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 66, Rue Caumartin, Paris.

Lecture

ON

DROPSY WITH KIDNEY DISEASE.

Delivered at King's College Hospital,

By NESTOR TIRARD, M.D. LOND., F.R.C.P.,

PHYSICIAN TO KING'S COLLEGE HOSPITAL AND SENIOR PHYSICIAN TO THE EVELINA HOSPITAL FOR SICK CHILDREN.

GENTLEMEN,—Cases of dropsy associated with some form of kidney disease are very commonly under your observation both in our wards here and at the Evelina Hospital, and they never fail to afford interesting subjects both for speculation and for treatment. The present juncture appears to me to be an appropriate one on which to address you upon this subject, as you will have noted from the medical journals that the whole question of the connexion between dropsy and kidney disease has recently been under review at the Royal Medical and Chirurgical Society. The views there expressed I propose to criticise later, after a brief consideration of the clinical aspects which you can all verify by direct observation.

Dropsy is met with in the course of very various diseases, and the ultimate explanation of the condition seems to be incapable of being reduced to any single general law. In a previous lecture<sup>1</sup> I dealt mainly with the explanation of dropsy associated with heart disease, but incidentally referred to the probability that many cases of dropsy with chronic kidney disease were to be ascribed to a similar chain of events. This view has since been confirmed by many observers; and in the course of the debate at the Royal Medical and Chirurgical Society it was interesting to note that many of the speakers referred one form of renal dropsy to cardiac weakness, indicated by dilatation and failure of strength. One of the main contentions in my former lecture was that probably this failure of strength had been too much neglected in the estimation of the ultimate causes of cardiac dropsy, while the theory of backward engorgement had been, in my opinion, pushed too far, although the impeded flow of blood through the veins undoubtedly had a large influence in the causation of dropsy, inasmuch as it would account for the diminished reabsorption of fluid through the lymphatic system. Still, when this lecture was written I was careful to indicate that all forms of renal dropsy were not readily explicable by any single theory, since I was convinced that under this apparently simple term more than one set of circumstances contributed to the result.

Viewed from a clinical aspect, there can be no doubt that renal dropsy occurs in two very distinct forms. The first, marked by general oedema, is the variety met with in cases of acute nephritis, more particularly when it is the result of scarlet fever. This general oedema is commonly coincident with the commencement of the nephritis, being frequently the first indication to attract attention. Children are frequently brought to the Evelina Hospital for the treatment of this general dropsy, the original attack of scarlet fever having been so slight as to have passed almost unnoticed. In such cases, however, inquiry mostly reveals a brief history of sore-throat and malaise, which doubtless constituted almost all the objective symptoms of the attack of fever. With children continuously under observation from the time of the rash Dr. Mahomed considered that the onset of renal changes might be predicted from an increase of arterial tension, and he described a pre-albuminuric rise of tension. His observations have not, however, received general endorsement, many accurate observers having failed to find the condition he described. Dr. Ringer considers that the onset of albuminuria and dropsy subsequent to scarlet fever is generally marked by a rise of temperature, and that the threatened attack may be averted by the prompt employment of aconite. Ordinarily, however, the clinical sequence of albuminuria, of considerable reduction in the amount of urine and of dropsy is very rapid. Headache and malaise frequently herald the attack, and are speedily followed by puffiness, which commences about the eyelids and spreads to the face, the trunk, and the extremities. The swollen condition of the face gives a mask-like aspect,

the features becoming absolutely devoid of expression. The oedema of the extremities renders movements difficult and clumsy, and the absolute bulk of the patient appears to be greatly increased. That the oedema is not confined to the subcutaneous tissues is often evidenced by some increase in the rate of respiration, which indicates a coincident oedema of the lungs, and which may be attended by cough and scanty expectoration. Another very characteristic feature of this acute form of dropsy is to be found in the extreme condition of pallor all over the surface of the body—pallor which appears to result more from the oedematous condition of the skin than from any profound alteration of the blood-colouring matter.

Curious cases of post-scarlatinal dropsy without albuminuria have frequently been recorded. Some are mentioned by Dr. Goodhart in his valuable work on Diseases of Children, and in St. Bartholomew's Hospital Reports Sir Dyce Duckworth reviewed this subject some years ago. This condition had also been noted by Todd in his Clinical Lectures, and by Henoch in his book on Diseases of Children. I have frequently seen children with this anomalous condition at the Evelina Hospital, both in the wards and in the out-patient room. I may say, in passing, that it is generally held that the facts are deceptive, that a very transient form of albuminuria may have been present before the child was brought under observation, or else that microscopic evidence of the nature of the case may be found, even though no chemical reaction may be given. The explanation of these cases is, however, so full of difficulty that I reserve it for future consideration.

Reverting to the more common type of acute general oedema with indications of acute renal congestion, under favourable conditions this form of dropsy passes away as the case progresses. As the renal changes undergo improvement the volume of urine passed increases and the dropsy diminishes proportionately. Sometimes a similar result is attained as a consequence of the employment of hydragogue purgatives and of sudorifics, by which means the amount of fluid in the circulatory system becomes diminished, and hence the return of the effused material is favoured. These changes depend upon the general law that the absolute quantity of fluid in the vascular system is practically kept at a constant quantity, and that drain from one part of the system is speedily equalised by absorption from another. Mere diminution of dropsy is, however, not to be regarded as indicative of complete restoration. The quantity of urine eliminated may be increased and the dropsy may diminish, even though examination of the urine may show, by the presence of albumen and by its microscopic characters, that the case is gradually becoming chronic. Dr. Dickinson considers that this diminution of dropsy is to be looked upon as the result of some change in the capillaries as well as of hypertrophic changes affecting the arterioles by which the increased tension is combated. He assumes a conservative change in the arterioles as the explanation of the improvement so far as the dropsy is concerned.

The second form of dropsy is that met with when the renal changes are chronic; but this variety is really, I believe, divisible into two perfectly distinct forms, the one occasionally precluding the termination of the case and due to cardiac rather than to renal failure, this form, as before mentioned, being practically undistinguishable from the ordinary cardiac dropsy associated with venous engorgement, with dilatation of the heart and consequent failure of suction action and of propulsive force. This form of dropsy affects the lower extremities primarily, and only in extreme cases is the oedema found to proceed upwards. Another more truly renal form of dropsy occurring in the course of chronic kidney disease is that which appears to be only a modification of the acute variety, and which leads to the appearance, so happily designated by Dr. Moxon, of "a large white mass with a large white kidney." Very little reference was made to this condition in the course of the debate at the Royal Medical and Chirurgical Society. Most of the speakers mentioned the acute general dropsy of acute nephritis and then turned to the late form of dropsy of cardiac origin. It may therefore be of interest to remind you of the way in which Sir William Roberts<sup>2</sup> deals with the question of dropsy in chronic Bright's disease. He says: "Dropsy is much oftener absent in the chronic than in the acute form. It is much more constant with the smooth large than with the granular contracted kidney. Of the latter class, probably one-third or one-fourth of the cases run their entire course without dropsy.

<sup>1</sup> THE LANCET, May 31st, 1890.

<sup>2</sup> Urinary and Renal Diseases, fourth edition, p. 402.

The effusion begins quite as often in the feet and legs as in the face; it is commonly slight and partial, but sometimes excessive and general. When the heart or liver is diseased, ascites and œdema of the legs become disproportionately prominent. The effusion is apt to change its seat capriciously, and it comes and goes from time to time. Sometimes it disappears totally for months and then returns again. More frequently, after a subsidence of the general dropsy, œdema lingers obstinately in one or two places—over the flat of the tibia, about the ankles, beneath the eyelids, under the conjunctival membrane or about the genitals. The presence or absence of dropsy generally, but by no means always, corresponds with the abundance or scantiness of the urine; but it has no relation to the amount of albumen." This passage has an important bearing, not only upon Sir William Roberts' experience of the relative frequency of dropsy with the smooth large and with the granular contracted kidney, but it also answers in advance some of the arguments adduced by Dr. A. Haig.<sup>3</sup>

Turning now to the theories suggested in explanation of renal dropsy, it may be convenient to deal first with those of Dr. Dickinson. He indicated that there were two modes by which an exudation from the capillaries might lead to dropsy. If too much of this exudation was poured out or too little carried off, dropsy resulted; but in his latter remarks he appeared to confine his attention entirely to the former mode, although the teaching hitherto has been that both modes must be in operation simultaneously. Dr. Dickinson attributed the association of œdema and increase of tension in nephritis to "some condition of the capillaries due to abnormality of blood which both hinders its passage and promotes transudation." In considering the transition from the acute to the chronic stage he noted the contradiction of the diminution of dropsy with further increase of arterial tension, and he maintained that the cardio-vascular change of advancing renal disease is the antagonist of dropsy. To make the contrast more complete, he said that there is "much dropsy with slight hypertrophy in nephritis, little dropsy and much hypertrophy with the granular kidney, so long as the heart remains undilated; and, finally, on the stretching of the heart, increase of dropsy and often pulmonary apoplexy." Somewhat later he makes the admission: "What the nature of the capillary obstruction is must be left undeclared. Changes in the blood may affect its passage in many ways. Fluids of different sorts pass through inanimate tubes with different degrees of facility, besides which the capillaries, though not muscular, have been demonstrated to be contractile." It will be seen that, so far as acute nephritis is concerned, our knowledge of the ultimate causation of dropsy has not been materially advanced. That a change in the nature of the blood is a prime factor has long been conceded, but it has sometimes been thought to result in filtration or transudation under pressure, sometimes in diffusion or osmosis, as Dr. Dickinson himself points out. It is of course conceivable that by some capillary contraction, excited by the toxic influence of the blood, the pressure within the capillaries should be raised, the blood current retarded, the nutrition of the capillary wall impaired and thus transudation might be favoured. All this, however, though interesting, is mere speculation, and its force seems to be confined almost solely to the early stages of acute nephritis. These theories will not explain the condition of dropsy as it occurs in the course of a case dependent upon the smooth, large kidney, and the theories become least satisfactory when by them we attempt to explain the way in which the effusion "changes its seat capriciously" or "comes and goes from time to time."<sup>4</sup> The most convincing portion of Dr. Dickinson's paper on Renal Dropsy is that in which he accounts for the diminution of dropsy in cases of granular kidney, where he submits the view that the constriction of the smaller arteries must cut off the blood from the capillaries and presumably lessen the pressure in them and exudation from them.

Turning now to the views expressed by others in the course of debate upon Dr. Dickinson's paper, Sir George Johnson believed that "renal dropsy was the result of an active vital secretory process consequent on an accumulation of various morbid fluids and solids in the blood," and he summed up his views shortly as follows: "That the arterioles could impede or arrest the circulation; that there was no

evidence that the capillaries possessed a similar power; that there was no evidence of an increase of capillary pressure in renal dropsy, but probably that it was diminished; that it was difficult to explain effusion through capillaries mechanically, and that renal dropsy was best explained by regarding it as the vital act of the endothelium, excited to eliminate certain noxious solids and fluids from the blood." Dr. Pyc-Smith followed on somewhat similar lines, considering that renal dropsy might have some connexion with the secretory power of the capillary endothelium, and he quoted Heidenhain's experiments in proof of the possession of such an active selective influence by the epithelium. Arguing from the distribution of fluid in acute renal dropsy that it was not subject to the action of gravity, Dr. Pyc-Smith thought that it was probable that the condition was "not a dropsy at all, but an inflammatory effusion," and a little later he said he believed that the anasarca should be regarded as an "active inflammatory change in the connective tissues." It is difficult to harmonise this view with the ordinary sequence of events in other active inflammatory changes in the connective tissues; hence, although the suggestion is attractive and novel, this theory scarcely seems to be likely to gain many adherents. Dr. Douglas Powell thought that dropsy of renal disease was osmotic, and intended to compensate for deficient kidney secretion, increasing in proportion to the renal insufficiency and decreasing as it was re-established. Dr. Broadbent found so many points of resemblance in renal and cardiac dropsy as to suggest that there must be a similarity of causation, and this led him to look primarily for some hydraulic cause for renal dropsy. He thought Dr. Dickinson had probably furnished the most satisfactory explanation of renal dropsy yet formulated, and, without accepting it definitely, he was greatly disposed to regard it as in all probability the correct explanation. Without trenching upon the further discussion at the Royal Medical and Chirurgical Society (which you will find fully reported in THE LANCET of April 30th, 1892, and May 14th, 1892) I may say that I have put before you the main points of difference rather than those upon which common ground might be claimed. As I have before said, there was practical unanimity about the cardiac nature of the dropsy sometimes seen towards the termination of cases of granular kidney. The frequency of acute dropsy with acute nephritis also received full consideration, but the dropsy of the large white kidney was almost left out of account, in spite of its greater frequency when compared with the dropsy seen with the small granular kidney. Of the clinical features there can be no dispute; they are matters of common observation. The difficulty lies in the explanatory theories. Dr. Dickinson assumes capillary obstruction, but does not define its nature. Sir George Johnson proposes an active vital secretory process. Dr. Pyc-Smith suggests an active inflammatory change in the connective tissues, and Dr. Douglas Powell looks to compensatory osmosis. This brief summary will show you how far the question is removed from a final solution, and will be enough, I trust, to prove that the subject may still be regarded as one waiting further observations and elucidation.

**RICHMOND WATER-SUPPLY.**—It is stated that a welcome addition to the water-supply of this borough has been discovered, in the course of the construction of two wells. It is estimated that this "find" will save the rate-payers a sum of between £2000 and £3000.

THE following shows the number of patients in the several fever hospitals of the Metropolitan Asylums Board on Sept. 6th:—At the Eastern Hospital there were 409 patients suffering from scarlet fever, 71 from diphtheria, 1 from typhus and 35 from enteric fever; the North-Western Hospital had 395 scarlet fever patients, 80 diphtheria and 20 enteric fever; the Western Hospital were accommodating 312 scarlet fever cases, 40 diphtheria, 3 typhus and 9 enteric fever; at the South-Western Hospital 314 scarlet fever patients were on the books, whilst the number of diphtheria and enteric fever cases was 60 and 21 respectively; the South-Eastern Hospital had 397 cases of scarlet fever, 22 of diphtheria, 1 of typhus and 6 of enteric fever; the Northern Hospital contained 725 cases of scarlet fever and 20 cases of enteric fever; and the Gore Farm Hospital 714 patients suffering from scarlet fever. Only 5 cases of small-pox are recorded as being in hospital on this date, these being on board the hospital ship *Atlas*.

## CLINICAL NOTES ON LEPROSY IN KASHMIR.

By ERNEST F. NEVE, M.D., F.R.C.S. EDIN.,  
SURGEON TO THE MISSION HOSPITAL, JOINT HONORARY SUPERINTENDENT  
TO THE STATE LEPROSY ASYLUM.

DURING the past eighteen months 152 lepers have attended the Mission Hospital as out-patients. Of these, 116 were cases of anæsthetic leprosy, 89 of whom had no tubercles. Sixty were admitted as in-patients to the Kashmir State Leprosy Asylum and were under observation for a time. The following is an analysis of the most marked symptoms. I have endeavoured to obtain some light (1) on the earlier phenomena of anæsthetic leprosy, and (2) on the relation of symptoms and signs to the period or age of the disease.

TABLE I.

No.	Age.	Years ill.	Earliest symptoms or signs observed by patient.
1	30	1½	Anæsthesia of extensor surface of both feet and arms.
2	50	3	Ditto of both feet.
3	22	5	Eruption all over body, followed by anæsthesia.
4	30	1	Ulcer under metatarsophalangeal joint of great toe.
5	40	8	Anæsthesia of right gluteal region and right ankle, outer side.
	50	6	Ulcer under metatarsophalangeal joint of both great toes; swelling of left leg.
7	40	1½	Swelling of both feet; no anæsthesia then.
8	30	6	Blisters over inner malleolus and sides of knees.
9	65	6	Burning pain on outer sides of thighs; anæsthesia subsequently.
10	30	3	Feeling of weight in shoulders and limbs; subsequent blisters and anæsthesia.
11	20	½	Swelling of feet and burning sensation; subsequent anæsthesia.
12	30	4	Anæsthesia of feet; blisters; eruption over chest.
13	30	3	Blisters of legs.
14	26	6	Sole of left foot used to get wounded; blisters on outer side of thigh.
15	36	6	Cracks of foot; blisters; subsequent anæsthesia.
16	24	12	Swelling of face; tubercles of cheeks.
17	30	1½	Anæsthesia and blisters on feet and legs.
18	50	8	Blisters on legs.
19	30	7	Anæsthetic patch behind great trochanter.
20	30	½	Blisters on outer side of left leg, then anæsthesia.
21	30	3	Cracks on soles, then anæsthesia.
22	25	3	Blisters on backs of forearms; pains all over.
23	30	3	Anæsthesia all over and blisters.
24	25	10	Anæsthesia of backs of feet and hands.
25	40	7	Swelling of left foot; subsequent anæsthesia.
26	32	5	Patch of anæsthesia at back of neck.

Let us now compare this table with another showing the leading symptoms and physical signs presented by patients who, when observed by the surgeon, had been less than a year ill.

TABLE II.

No.	Months ill.	Symptoms or signs observed by the surgeon in cases recently affected.
1	6	Tubercles on face; shiny skin.
2	4	Anæsthesia of both feet; itching of face.
3	2	No anæsthesia; face characteristically altered.
4	6	Anæsthesia; no tubercles; face clear.
5	3	Large pink anæsthetic patch on right hand and forearm; face clear.
6	3	Anæsthesia of both feet; face indurated.
7	6	Swelling of feet; patches of anæsthesia on both legs and on body.
8	6	Burning in soles of feet; no anæsthesia.
9	1	Anæsthesia of right hand and foot; face dusky red.
10	4	Small pink tubercles on face; no anæsthesia.
11	1½	Skin swollen and shiny; very little anæsthesia.
12	4	Anæsthesia of scapular region; small tubercles over body.
13	2	Anæsthesia of both legs and abundant tubercles.
14	4	Patches of anæsthesia on different parts of body.
15	2	No anæsthesia; tubercles on different parts of body.
16	3	Large anæsthetic patches.
17	6	Anæsthesia of arms; indurations in gastrocnemius and triceps.
18	3	Anæsthetic patches; ulcer of nose.
19	4	Anæsthesia of outer sides of legs.
20	3	Anæsthetic patches on different parts.

It is interesting to compare the lesions of those who have been only a few months ill with those who have had leprosy for years.

TABLE III.

No.	Years ill.	Physical signs observed in patients more than five years ill.
1	14	Anæsthesia of both feet and hands; ulcers on both.
2	6	Anæsthesia; one foot swollen.
3	13	Anæsthesia; ulcer on sole of foot.
4	10	Anæsthesia; ulcers on both heels.
5	6	Anæsthesia; ulcer on sole of foot.
6	7	Anæsthesia; nose depressed from antecedent necrosis.
7	7	Anæsthesia; blisters; face very little changed.
8	7	Anæsthesia; ulcers of feet; depressed nose; blisters.
9	7	Anæsthesia; necrosis of phalanges; blisters.
10	6	Anæsthesia; scars and ulcers of face; depressed nose.
11	15	Tubercles of face, larynx and body; general ulceration of limbs.
12	6	Anæsthesia; ulceration; loss of phalanges.
13	6	Anæsthesia; discolouration of forehead; occasional blisters. (Mild case.)
14	6	Tubercles on face, pharynx and body; anæsthesia.
15	10	Anæsthesia; swelling of hands.
16	6	Anæsthesia of legs and arms.
17	14	Anæsthesia of both feet; loss of phalanges.
18	8	Anæsthesia of hands and feet; ulcer of sole of foot.
19	14	Anæsthesia of hands and feet; loss of phalanges.
20	7	Anæsthesia; ulcer of sole of foot.

We see, then, that in patients more than five years ill anæsthesia is almost invariably present. It is usually more profound than in the earlier stages. Then ulcers, especially the perforating ulcer of the foot, bone affections of the nose, fingers and toes, and also of the tarsus—these are characteristics of advanced leprosy, and they are associated with superficial ulcers and with scars and cicatricial thickenings of most of the tissues of the body.

With regard to cases in the earlier stages and the history given by patients, we notice that the following are apparently early symptoms:—Eruptions, swelling, sensations of pain, heat or itchiness, blisters, ulcers and anæsthesia. I say apparently, because on closer examination some of these conditions are found to be undoubtedly due to advanced leprosy. Let us examine them briefly.

Eruptions, swelling, sensations of pain, heat or itchiness are often associated. I shall not discuss tuberculous leprosy here. The least advanced case of leprosy which I have seen was a patient who presented a slightly raised, indurated, dusky-red patch on his left cheek. In another there was duskiness of the face with some thickening of the skin of the nose. Below the malar bones were slightly raised dusky-red patches. The lobes of the ears were a little thickened. This patient developed well-marked herpes zoster of the right side of the thorax while under observation. Pain, burning sensations and swelling are prominent early symptoms, and occasionally hairs may drop out early in the course of the disease.

D. M.—, aged thirty, six months ill. The hairs of his eyebrows are absent on the outer aspects and scanty at the inner; his whole body, including the face, is red, and there is inflammatory œdema of the skin, especially marked in the extremities. In places there is pitting on pressure. This condition is associated with great pain, burning sensations and fever. There is tenderness of nerve trunks on pressure. Another patient, S. C.—, has had periodic attacks of this nature, in the last of which patches of small wheals appeared on the body and limbs.

We have, then, here two classes of phenomena. One a skin affection of a leprosy nature, probably a specific lesion—viz., the raised, red, indurated patches. Later in the disease these patches subside, and may even almost disappear, leaving traces only of thickening, irregularity and pigmentation. They are probably related to (leprosy) tubercles, although quite distinct.

The other class comprises the various conditions resulting from leprosy neuritis—viz., inflammatory œdema with fever and sensations of pain and heat. Each attack of this nature is apt to be followed by extension or intensification of anæsthesia. Such attacks are recurrent, and most leprosy are liable to them.

If the back of a leper be examined it is often found to be the seat of a macular eruption. The following cases are illustrations:—

S. M.—, aged twenty-one, four months ill. On the back there is a very faint mottled and ringed eruption consisting of circles the size of a florin or larger, with dusky brown or reddish margins.

M. C.—, aged thirty-one a more advanced case, three

years ill. The whole of the back was covered with pale circular patches not anæsthetic, and edges not pigmented, but shown up by surrounding dark skin.

**K. R.**—, aged thirty-two, five years ill; condition still more pronounced. The whole of the back was covered with large pale patches, especially the lumbar and sacral regions. The margins of these patches are circles, with the convexity towards the surrounding healthy skin. In the dorsal region there is an island with loss of pigment and similar convex margins. The skin is not thickened, and there is no anæsthesia.

In some cases, however, I have found these patches anæsthetic. When the margins of the circles are strongly pigmented the appearance of the patient is very striking. Sometimes the whole body and extremities are affected in this way. The condition is also sometimes associated with tuberculous leprosy. It is, I think, to be attributed to interference with nutrition resulting from leprous neuritis. Such lesions are atrophic. Sometimes the opposite condition is present.

**J. B.**—, aged forty, sixteen months ill. Over the lower part of the sacrum there is a darkly discoloured patch the size of the hand, with overgrowth and a desquamating condition of the epithelium, but no anæsthesia. I have referred elsewhere to leprous ichthyosis.<sup>1</sup>

**Blisters.**—These are of two kinds. In early leprosy, and also to a less extent later on, blisters of a trophic variety may form. Their favourite seat is the ulnar side of the hand or wrist and the outer side of the foot or ankle. The other variety of blister is due to an irritant, either heat, cold or friction. Of course the absence of sensation is a very frequent cause of burns. Lepers burn their hands while cooking their food or warming themselves. Exposure to severe cold acts similarly. The feet are apt to become blistered from this cause. Friction blisters occur especially on the outer sides of the body and near the knees or elbows. This latter class of blisters is almost invariably associated with advanced leprosy. The trophic blisters have usually no red areola. They are circumscribed and heal readily. In two cases there was no anæsthesia of the part where they appeared. The "irritant" blisters, on the other hand, are generally on anæsthetic sites, and they are apt to leave troublesome sores.

**Ulcers.**—These are not at all characteristic of *early* leprosy. They occur in close relation to anæsthesia. When a foot is anæsthetic a friction ulcer often appears under the metatarsophalangeal joint of the great toe, the seat of the greatest strain in walking. Ulcers may also be present at any of the three points in the foot on which the weight of the body rests. Then there is the peculiar perforating ulcer of the sole. This is characteristic of advanced leprosy. It is perhaps dependent upon posterior spinal sclerosis. (Impairment of knee and ankle reflexes is common in lepers. Nerve stretching facilitates the healing of the perforating ulcers. In these respects a similarity to locomotor ataxia exists; but the likeness stops here, for I have never seen a leper with ataxic gait.) Ulcers in connexion with diseases of the bones and joints of hands or feet are common. The cracks on the soles of the feet, of which some lepers complain, are, I think, chiefly the result of walking in the snow. But they are common enough amongst the non-leper agricultural population who have to work in wet, muddy rice fields.

**Anæsthesia.**—This is the most prominent feature of leprosy in Kashmir. It is often found very early in the course of the disease (see Tables I. and II.), and it is almost invariably present in the later stages, where it is also profounder and more extensive. It is a nerve lesion the result of sclerosis following neuritis. Extensor surfaces are more liable than flexor to anæsthesia, but anæsthetic patches may occur at any part of the body. Often the skin of such patches is paler than elsewhere, but sometimes it is quite unchanged, and sometimes patches of pale skin are not anæsthetic. **M. W.**—, aged fifty, has two pale patches of skin: one below the scapula on the right side is not anæsthetic; the other on the right side of the lower lumbar region is anæsthetic. **W. M.**—, aged forty, three years ill, has an anæsthetic patch an inch and a half square behind the left acromion, the skin of which is quite unaltered. Another peculiarity of this anæsthesia is that it is rare for one to be able to map it out according to the anatomical distribution of any one nerve. It is patchy and capricious in its manifestations. I think this is a point in favour of its central origin. Indeed, most of the evidence points to a poison which attacks the central nervous system. A therapeutic desideratum is some

drug which will act as an antidote to that poison in a more satisfactory way than atropine does to tuberculin. In its later stages leprosy is not curable. There is too much scar tissue. It may be arrested; symptoms may be greatly alleviated. More than three hundred nerves have been stretched in this hospital for the relief of anæsthesia and ulcers; but this is an operation for relief, not cure. Like tuberculosis and syphilis there is a stage in leprosy when the conditions of cure no longer exist.

## LARYNGEAL PARALYSIS IN INFANTS.

BY W. ROBERTSON, M.D. GLAS.,  
SURGEON TO THE THROAT AND EAR HOSPITAL, NEWCASTLE-ON-TYNE.

WITHIN the last five years I have met with from time to time cases of a disorder in children, of ages varying from three weeks to eighteen months, to which the above term may be provisionally applied. These cases—six in all,—of which I have notes, survived and got rid of the disease, with one exception, and in this case a fatal termination was brought about through exposure to the east wind at a constant resort. A brief clinical account of one or two of these cases will illustrate the condition to which I refer.

**CASE 1.**—**C. H.**—, aged two years, was brought to me during June last, suffering from noisy, difficult and prolonged inspiration; expiration quick and easy; voice intact. There was slight cyanosis, increased on exertion, as was also the inspiratory distress. The ribs were much deformed, the lateral regions of these being indrawn. The epigastrium as well as the soft parts above the clavicles were retracted during inspiration. The larynx was observed also to move unduly during inspiration. Examination of the throat demonstrated an extreme state of granular pharyngitis extending to the vault. The statement given by the mother was that the child began to suffer from what the doctor called "chronic croup" (in part a good descriptive term, for the condition resembled superficially that of a child in moderate distress from typical croupous breathing) after some ill-defined pulmonary attack when it was six months old. Since then, when the symptoms were not so bad as now, the child has been a continual source of anxiety, more especially during the night and morning just after waking, when great respiratory difficulty was generally experienced, a discharge of mucus giving great relief. No laryngoscopic examination could be made. From the examination that could be made of the chest this was normal, the steno-tic murmur, however, obscuring to a great extent the vesicular. The child was put upon bromide of ammonium; a nasal alkaline spray and a 2 per cent. solution of resorcin in mineral oil to be dropped into the nose. A week or two of this treatment improved matters but slowly. On July 17th, 1891, I intubated, retaining the tube for one hour. This procedure was followed by more decided improvement. Shortly after this I scraped out the post-nasum with the finger-nail and recommended a continuance of spray and resorcin. On the 25th the child was intubated again and the tube retained for two hours, during which the child slept for the most part and regained a more natural colour. On Aug. 28th the child had greatly improved. The inspiratory dyspnoea had almost entirely disappeared. He was able to rest well at night and had no difficulty whatever on awakening.

**CASE 2.**—**J. N.**—, aged three weeks. This infant when first seen was found to be suffering from somewhat acute inspiratory dyspnoea dating from a few days after birth, and most pronounced at nursing periods. The inspiration was noisy, so that it could be heard in the next room. Examination of the throat showed a thickened granular condition of the pharynx mucosa. There was no fever or enlarged glands about the neck. The child was fairly nourished. The treatment consisted of bromide of ammonium, with the employment of nasal spray and resorcin drops for the nose. These remedies were used twice daily for one month, when practically the child was well. Subsequently the remedies were used thrice weekly for three months. I saw this child nine months afterwards and found it remarkably plump and well. The mother states, however, that respiratory difficulty of the above character now and then in a slight degree troubles the child.

CASES 3 and 6 resemble the above so much that detail is unnecessary.

CASE 4.—G. A. S., at the age of six months, began to suffer from symptoms noted in the above series of cases, their severity increasing as time went on until he was one year old, when these were varied by the occurrence of convulsions. There were the usual nightly and morning exacerbations. The child recovered. At present the child suffers from post-nasal growths.

CASE 5 displayed the symptoms described in the above. Through an unadvised stay at a coast resort and during the prevalence of east winds the child caught cold and shortly succumbed.

These cases will illustrate the condition in question as well in its severer as in the milder forms met with. They also illustrate the efficacy of well-directed treatment. It will be observed from the above that the condition in question is a state of persistent dyspnoea lasting over a considerable period and exclusively affecting inspiration; that the dyspnoea, mild at first, increases in time, as in Case 1, to a state of dangerous asphyxia. Judging from the character of these laryngeal symptoms bilateral improvement of the dilators of the glottis suggests itself, which, when it becomes grave, is succeeded by, we may suppose, secondary contraction of the unopposed adductors. The power to cough, the comparatively intact phonation, the length of time over which the disease extends, and the deepening of symptoms as that goes on differentiate the condition from affections of the abductors—e.g., spasm. These same qualities equally disprove the existence of, e.g., papillomata. (Case 1 was to have been operated on for this before I saw it.) Not one of these cases could be referred to this condition, for in such it is recognised that there is a great frequency of alteration of voice. Diphtheria in every case could be eliminated. In none of the cases were there noticed evidences of cervical or thoracic tumour or any pressure on the vagi or recurrents. It would seem, therefore, that the only probable explanation of the phenomena is to attribute these to a temporary bilateral abductor paralysis. As to the etiology of this, the associated diseased condition of the post-nasum and pharynx observed in every case demands attention. The age also must be taken into account. It is justifiable to suppose that irritation set up in these regions is transmitted to the medulla, there exciting and exhausting the accessory nucleus, and that this leads up to impaired nervous energy to the abductors. Another point is that catarrh, equally possible, may in such cases interfere with the function and nutrition of the muscles in question. In the earlier cases met with I relied for treatment principally on bromide of ammonium, tepid sponging, &c., but of late have treated more vigorously the post-nasal and pharyngeal conditions, and with the best results when the cases are not met with in the earlier phases of the disease. Where granulations are felt in the post nasum these are crushed or otherwise destroyed. In severe cases like Case 1 I should at once intubate, because, apart from the relief to respiration for the time being, the insertion of the tube seems to have a rousing effect on the general musculature of the larynx. It may be supposed to undo any secondary contraction that may have supervened during the course of the malady, if this has supervened long enough to allow of secondary contraction of the constrictors to have taken place.

Newcastle-on-Tyne.

### ON THE INFLUENCE OF NASAL STENOSIS ON THE GENERAL HEALTH.<sup>1</sup>

By W. SPENCER WATSON, F.R.C.S. ENG., M.B. LOND.

THERE is good evidence that many forms of disease, not obviously of nasal origin, have been cured, relieved, or prevented by treatment successfully directed against nasal stenosis. This I take as my text; and though I may not be able to prove the statement categorically, I trust that I shall be able to show that it is well founded and sufficiently accurate to form a trustworthy guide in treatment.

It may be well at the outset to give a brief epitome of what is known as to the functions of the nose as a part of the respiratory apparatus.

1. The inspired air is warmed to the temperature of the blood or within 1° or 2°F. of that temperature.

2. The inspired air is moistened by watery vapour exhaled from the nasal mucous membrane.

3. The inspired air is filtered and to a great extent freed from foreign particles and micro-organisms. Some of these become adherent to the vibrissæ and some to the mucous surface, and in time are extruded with the mucus; the more irritating vapours or micro-organisms exciting a free flow of fluid mucus, which in extreme cases is expelled by sneezing or reflex cough.

4. The temperature of the blood is lowered by the evaporation from the pituitary membrane.

5. The expired air contains some carbonic acid (an appreciable trace), due to the interchange of gases in the nose independently of those due to oxidation in the lungs. There is also probably an evolution of other animal products from the same source.

These being the chief functions of the nose as a part of the respiratory tract, what modifications or interruptions are brought about by stenosis? This latter condition may be temporary or permanent, partial or complete, and the effects must vary according to each variety or phase of the obstruction.

*a. Temporary stenosis* occurs in acute rhinitis of any kind, in simple chronic rhinitis and in congestive irritation of the pituitary membrane from any cause—e.g., that of the presence of a foreign body, of rhinoliths, or of sequestra of bone. The turbinated bodies are the parts more especially liable to swelling under these circumstances by reason of the structure of their submucous erectile tissue. The stenosis due to turgescence of this part of the membrane is distinguished from that due to hypertrophy, partly by the clinical history of the case, but more precisely by the appearance and behaviour of the swollen part, which dimples easily when pressed upon by a probe, and also by the fact that it is almost always speedily reduced in extent and bulk by the application of cocaine.

*b. Permanent stenosis* is chiefly the result of chronic rhinitis with hypertrophy, and often of intra-nasal growths and polypi. Distortions and malformations of the septum, naso-pharyngeal growths, adenoid vegetations of the naso-pharynx, enlargement of the tonsils, thickening of the soft palate and congenital and traumatic deformities are the more common causes of permanent stenosis.

*c. When the obstruction is only partial*, as is often the case, the breath channel being narrowed only, but not occluded, there is the obvious difficulty of deciding in a given case whether the supposed remote effects such as headache, migraine, asthma, cough, laryngeal spasms, dyspnoea and secondary changes in the larynx, trachea and bronchi may not be due to irritation rather than to obstruction. A slight amount of swelling of the turbinates brings them or some point of their surface in contact with the septum, and as this part is especially sensitive, and rendered still more so by inflammatory changes, the local irritation thus induced may account for reflex irritation of the deeper parts of the respiratory tract. In some cases it is possible to put this to the test by touching with a probe the suspected area, and if, when this is done, the reflex action is induced, we have some evidence that irritation is more prominently at work than stenosis. The use of cocaine locally applied will also be an aid to diagnosis in the same direction. In the condition of hypertrophy there is no shrinking of the swollen parts as in the case of mere turgescence, and hence any marked relief of the symptoms following the use of cocaine is an indication that there is an area or point of excessive sensitiveness the irritation of which produces reflex action. When this is the result of these tentative measures much benefit is often derived by reducing the bulk of the hypertrophic membrane or growth. The application of the electric cautery or of a corrosive acid to the part will be generally sufficient, but if the obstructing part is very far back, and involves (as it often does) the posterior extremity of the inferior turbinate, the cold-wire snare or my own ring-knife will be the preferable methods for reducing its bulk.

I here exhibit a drawing from a typical specimen of chronic hypertrophy of the inferior turbinate occurring in a young gentleman whose life was rendered very uncomfortable by its presence. He was sometimes seized with fits of choking during his meals, and was always in terror from the feeling of obstruction. His mental condition was so depressed that his friends became extremely anxious about him. The operation by the cold-wire snare was followed by complete relief. In this case there was a difficulty in deciding as to how far stenosis alone or stenosis with hyper-sensitiveness of the

<sup>1</sup> Paper read at the Medical Society of London.

parts afforded the best explanation of the symptoms. There was no obstruction of the other nostril except during the attacks of acute catarrh, which were very frequent, but the nostril (right) from which the growth was removed was completely blocked by it. This case was one of chronic hypertrophic rhinitis. In this form of disease not only is the epithelial layer thickened, but the cavernous erectile tissue covering the turbinated bones and sometimes the submucous covering of the septum become permanently distended and lose the power of recovering their normal bulk. The glands occupying the submucous layer are also hypertrophied, and the surface of the membrane becomes corrugated and raised into folds or villous prominences, the posterior thirds of the middle and inferior turbinated bodies being most frequently affected in this way. The anterior extremity of the inferior turbinate and occasionally the anterior part of the middle turbinate, when hypertrophied, are generally uniformly swollen, and when pressed by the probe do not recede. Sometimes the anterior parts have also wart-like outgrowths on their surface, but these are not frequent and occupy only one or two spots or surfaces, differing from those on the hinder parts, where they are uniformly distributed over a considerable surface.

*Symptoms.*—The symptoms are those of stenosis more or less complete. In the advanced cases the breath channel may be completely occluded; in less advanced stages one or both nostrils may admit of a forced snuffling respiration. There is a constant flow of mucus from the anterior nares and a backward flow into the naso-pharynx, where the viscid secretions form adherent crusts, which are only detached with difficulty and much "hawking" and coughing. We have, in addition, the usual distress of stenosis, the habitual oral breathing, the snoring and distress of breathing at night, the nasal voice, impairment of hearing, of smell and taste, and asthmatic attacks, with occasional implication of the larynx. The uvula and velum become thickened and the elongation of the former gives rise to chronic irritative cough. The breath is sometimes offensive from the accumulation of the mucous secretions in the naso-pharynx, and there may be chronic pharyngitis due to the same cause.

The following cases are good illustrations of chronic hypertrophic rhinitis and of its effects on the general health.

**CASE 1.**—Mrs. E—, aged fifty-four years, very tall and stout, and with symptoms of stenosis and prominence of eyeballs; great mental depression and fainting fits; much difficulty of breathing at night; extensive hypertrophy of both inferior turbinates. Ether was given and the inferior turbinates removed entirely from end to end at two operations. Great relief resulted from this treatment. In the course of the next few months caustics were applied and subsequently vulcanite plugs for reduction of the hypertrophy of the middle turbinates. Much satisfaction was expressed by the patient. The improvement remained for several years, but whenever there were threatenings of a return of stenosis the plugs were resorted to, with much relief on many occasions. Within a few weeks (eight years after the first series of operations) this lady had a recurrence of the old symptoms due to growths from the outer wall of the right nostril. I removed these under the influence of cocaine by means of the cold-wire snare and the result has been perfectly successful, the nostril being now quite free from obstruction. The growth was polypoid with glandular hypertrophy and arose from the middle turbinates. It is instructive to remark that though the first operation seemed in this case to be very free, yet it is evident from the sequel that even the total extirpation of the inferior turbinated bone was insufficient and that it would have been better to have operated still more freely in the first instance.

**CASE 2.**—A gentleman's gardener aged thirty-five years. There were symptoms of stenosis for six years. Operations were undertaken for polypus, but without relief. A fibrinated outgrowth was seen from the anterior nares on the anterior third of the inferior turbinate. No posterior rhinoscopic view was obtainable, but by digital exploration soft growths were felt protruding into the pharynx from choanae. By ring-knife operation (under anaesthesia) the growths depicted in the drawings were removed at two operations (Figs. 1, 2, 3 and 4). Three years afterwards the patient remained perfectly free from nasal trouble and immensely improved in health, the commencement of his relief dating from the time of the operations, and having steadily continued ever since.

**CASE 3.**—Mr. H—, aged fifty years. Symptoms of aggravated stenosis had existed for years, with cleft palate. A good rhinoscopic view was obtained of growths on the hinder

extremities of the inferior turbinates, complicated with nummular polypi. Cocaine (20 per cent. solution) was applied freely and thoroughly. Numerous polypi were removed by the cold-wire snare. Ring-knife operation was

FIG. 1.

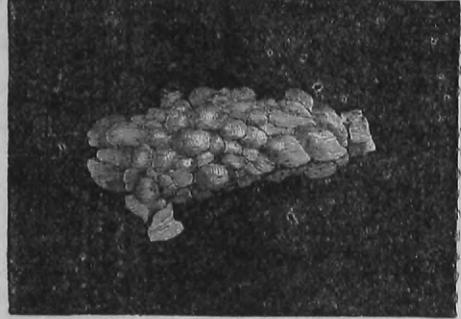

FIG. 2.

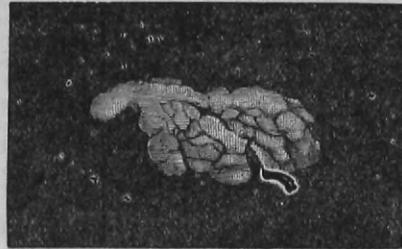

FIG. 3.

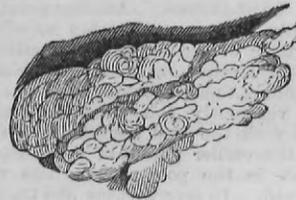

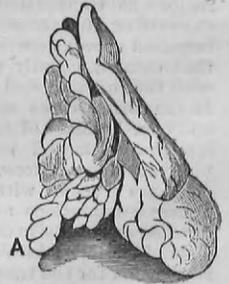

FIG. 4.

performed on the inferior turbinates. A portion of the hinder extremity of the inferior turbinate of the right nostril is shown in Fig. 5. The size of this growth is somewhat exaggerated in the drawing; it was, however, extraordinarily large. The results of the treatment were excellent and lasting. The polypi removed were some of them nummular in shape.

FIG. 5.

In such cases as those related part of the distress and nervous disturbance is occasioned by frontal headache and a feeling of distension due to retained secretions in the sinuses and ethmoidal cells. The pressure of the intra-nasal growths obstructs the orifices of the antrum, the frontal and sphenoidal sinuses, the lacrymal sac and nasal duct, and the general hypertrophy of the membrane may even lead to their permanent closure and a large accumulation of mucus. As a secondary result, sleep is disturbed and the patients wake up from horrible dreams or nightmare. This deprivation of natural refreshing sleep leads to general nerve disturbance and migraine and mental depression, so that the stenosis not only impedes free breathing, but at the same time interferes

with the functions of the sinuses, and thus gives rise to secondary disturbance of the nervous system.

These complications of stenosis make it the more imperative that any operations for its relief should be thorough and effective, so that free drainage of the sinuses may be quickly established. It is on this account that I think it very essential to perform radical and complete operations at one sitting under a general anæsthetic, and I suspect that our failures are sometimes due to the frequent repetition of partial and incomplete operations such as are recommended by some surgeons who employ the electric cautery for the removal of polypi. Each time a small polypus or portion of a polypus is removed a certain amount of inflammatory swelling is set up, and for a time the stenosis is increased. The patient not being under a general anæsthetic, it is impossible (except in the very rare cases of a single polypus or a very limited hypertrophy) to remove all the growths at one sitting, and few patients will submit to the numerous and repeated operations which become necessary when employing this method. The rule should be—(1) when there is complete obstruction with much constitutional disturbance to operate by a single operation under a general anæsthetic; (2) when the obstruction is partial and the symptoms unimportant, the growths being small and easily reached, to operate either by means of the snare or electric cautery, using cocaine and employing the frontal mirror as a guide to the instruments. Except in the simplest and most favourable cases a repetition of the use of the snare or cautery is absolutely necessary. When both nostrils are occluded and buccal respiration is therefore a necessity, the lungs receive the air cooler and drier, and discharge it with a smaller quantity of carbonic acid and animal excretory vapours than is the case in free nasal respiration. Unless there is a compensatory increased activity in the other excretory organs the blood becomes overheated, and as the lungs are embarrassed in their action the excretion of carbonic acid and watery vapour is more and more difficult, until the blood itself becomes overcharged with these products. Irritation of the larynx, trachea and bronchi follows, and in the worst cases bronchitis results. In the generality of cases the effects of stenosis are not so severe.

As to *asthma*, I have only had three in some hundreds of cases of chronic hypertrophic rhinitis. One of my cases of asthma associated with polypi and hypertrophy of the turbinates has been already briefly related.

A stoutish married woman thirty-five years of age had suffered from undoubted spasmodic asthma for eighteen years. When I first saw her about two years ago she had numerous polypi and advanced hypertrophy of the turbinates, but these had been previously discovered, and yet for various reasons no operation had been proposed. Here the asthma seemed to be of a confirmed type, and was, moreover, complicated with vesicular emphysema and frequent attacks of bronchitis. Nevertheless I advised operation, and removed polypi and hypertrophied membrane freely and thoroughly by two operations. The result exceeded my expectations and those of my colleagues who watched the case; for between five and six months there was not a single recurrence of the asthmatic paroxysms, and the general health improved so much that the woman was able to go to work as a domestic servant, though for many years before she had been incapacitated. For some months she was able to do some very hard work, but in April, seven months after the first series of operations, she had a recurrence of her old ailment. I found some broad-based polypi, which I have removed by several repeated operations with only partial relief of the asthma. After the last operation, on Nov. 5th, she had a severe attack of bronchitis and great oppression of breathing with regular midnight attacks, and these were controlled only by the use of eight-grain doses of citrate of caffeine. There has been no attack now since Dec. 10th, but she is again suffering from subacute bronchitis and the dyspnoea consequent on the vesicular emphysema. It is quite clear that in this instance of apparently confirmed asthma much benefit resulted from the employment of local treatment. In most cases, however, within my experience brilliant results are more than can be expected or hoped for. Bosworth of New York, indeed, and Schmiegelow of Copenhagen have had extraordinarily successful cases, the former having cured or relieved seventy-two out of eighty persons operated on for asthma or hay asthma.

*Hay Asthma.*—As for hay asthma, the disease is obviously one involving the general system and the respiratory mucous membrane as a whole, as well as that of the conjunctiva and lacrymal passages. To consider it as a disease originating in

the mucous membrane of the nostril would be to ignore all common experience and the outcome of the most careful inquiries by the most competent observers. The stenosis observed in some of the subjects of hay fever is due to the effects of chronic hypertrophic rhinitis, which is itself a consequence of the repeated catarrhal attacks so characteristic of the disease. This stenosis is a great aggravation of the other symptoms, and much benefit is often derived from operative treatment, as the suffocative attacks are much mitigated by a restoration of free nasal respiration. The subsequent use of plugs is especially indicated in this form of obstruction, and should be persevered in for many months and even years. This is a point not often insisted on in books; I think it very important.

The form of stenosis most interesting to the practitioner is probably that seen in newly born infants. A poor little child comes into the world with the instinct of getting its living by suction for the first few months of its existence, and with the idea that it will not be asking too much to be allowed to breathe at the same time. But in a few days, or even in a few hours, after birth "snuffles" of a virulent type sets in, and a cruel destiny declares that the child shall not suck and breathe at the same time—the one line of business may be carried on by itself, but not the two together; and, as both are essential, the suckling finds himself in an awkward predicament and begins to inquire why his environments are so unsuited to his physical potentialities—that at least seems to be the correct interpretation of the loud and frequent outcries and violent struggles that become too familiar to the mother and friends. The case is one of great urgency and danger. Not only is nutrition impeded in the ordinary act of sucking, but during sleep, the tongue in sucklings being always in contact with the roof of the mouth, the child is constantly in danger of being suffocated, and wakes up struggling for breath or falls into convulsions of an epileptoid character. Frequent repetitions of these attacks, if unrelieved, speedily put an end to the child's sufferings. Energetic treatment, however, at the outset, by frequent syringing with appropriate astringent and antiseptic solutions, and feeding by the mouth or by a tube passed into the œsophagus through the nostrils, almost always brings about a speedy change for the better. In addition to these measures, gum-elastic tubes passed through the nostrils and retained there during sleep enable the little sufferer to get tranquil rest. Should, however, the obstruction be only partial there is still great risk of much mischief to the chest walls and to the air cells from the long persistence of dyspnoea even of a mitigated kind. In the course of time the chest walls become contracted and flattened laterally, emphysema is produced, and the growth is stunted in all parts of the organism. Early and energetic treatment may, and often does, prevent these disastrous consequences.

The next most interesting form of stenosis is that connected with adenoid vegetations of the naso-pharynx, occurring as they do mostly in early youth and in young adults; they give rise to a set of well-marked and peculiar symptoms when the growths are sufficiently large and numerous as to cause serious obstruction in the posterior nares. When slightly developed and early treated the only symptom noticed is a somewhat dull articulation, as if from a cold in the head, and some amount of stertor during sleep. The general nutrition, however, does not suffer, and very little notice is taken of the defect, which is, according to my experience, very common. In such slight cases, as the body generally develops the pharynx expands, the general nutrition does not suffer, and the symptoms pass off without leaving any traces or inducing any secondary changes in the thorax. In a number of cases, however, in which the obstruction is allowed to go unrelieved for years and becomes aggravated by frequent catarrhal attacks not only is the articulation dull and indistinct, but the voice becomes habitually nasal; the *n* and *m* sounds are represented by the *ñ* and *b* or *l* sounds, and the hearing often suffers, the middle ear even in the worst cases being affected by the extension of catarrhal inflammation along the Eustachian tubes, the pharynx and tonsils are involved, and the latter often much enlarged. Snoring becomes constant at night and may be associated with paroxysms of a convulsive character, the patient waking up suddenly and struggling for breath. There is mucopurulent discharge from the nostrils and this is sometimes bloodstained, and a similar flow escapes from the mouth during sleep. The breath is offensive from the collection of puriform stringy mucus in the fauces; the breathing is laboured and the chest often permanently deformed by a

lateral compression and narrowed also in all its dimensions. The growth is stunted; the mental faculties are, or appear to be, dull. The youth is backward in his studies, and takes little interest either in them or in his games. He goes about with mouth agape, and, being often somewhat deaf, is credited with being almost imbecile. The alæ of the nose are flattened and dimpled in a characteristic manner, and some of the patients have a very peculiar way of twitching their upper lips and sides of the nostrils. With these obvious symptoms the diagnosis is easy, and is confirmed by rhinoscopic or digital examination of the naso-pharynx, where the soft rounded pea-shaped or oval growths are found lining the lateral walls and roof of the pharynx and obstructing the choanæ by overlapping them. When the disease has reached this stage the only relief obtainable is by operation for removal of the growths, and even at this advanced stage it is often possible to effect a cure of most of the symptoms, though there is much risk in allowing any of these symptoms, especially those affecting the ear, to go on to such a dangerous extent. The majority of cases, however, when treated energetically, give most satisfactory results. A lad who had been considered unfit for anything becomes bright, cheerful and intelligent, and seems quite a different being after the complete restoration of nasal breathing.

When we come to consider *syphilitic disease* in the nostrils, here the stenosis is of secondary importance, so far as the effects on the general health are concerned, with the exception of the syphilitic coryza in sucklings, in whom the obstruction to breathing becomes a matter of grave danger, not only to health, but to the life of the patient. It must be dealt with early and energetically, not less by local than by constitutional treatment, into the details of which it would be out of place to enter. In the syphilitic ozaena of adults with caries or necrosis there is the increased danger of the purulent infection due to the retention of foul discharges in the nostril. Fatal meningitis may result from these causes, and the removal of obstructing pieces of carious bone is often a means of saving patients when in this condition.

The stenoses of *malformed and distorted septum* are often overlooked, because though, as a rule, there is some obliquity of the nose externally, there may be a considerable twist of the septum without any visible sign externally. There is, however, a tendency (especially when the twist is sigmoid) for the septum to obstruct both nostrils and to produce all the usual effects of stenosis, laboured breathing and snoring at night, choking fits on going to sleep, contraction of the chest walls and, later on, asthmatic attacks. I have seen several cases of this kind, and it is supposed by Bosworth, Hack and many others that a form of hay fever is one of the results of congenital obstruction due to these various malformations. Readjustment of the septum by operation is certainly very beneficial in many cases; whether such operation will cure hay asthma, however, is, I think, extremely doubtful. Besides congenital distortions, the cartilage or bone of the septum may be enlarged and thickened and may cause obstruction of a serious nature, giving rise to considerable discomfort and affecting the general health in the same way as the other forms of stenosis. Local treatment efficiently applied is always beneficial, and is urgently called for if it is exciting chronic rhinitis, as it often does, or if the respiration is exclusively buccal in character. Traumatic, cicatricial and congenital occlusions from other causes all require attention, for the same reasons which apply to the condition already alluded to, and cartilaginous, bony, sarcomatous and malignant tumours of the parts surrounding the nostrils are often more formidable on account of the obstruction caused by them to nasal respiration.

It would be impossible to go into details of all these forms of obstruction. My object in bringing this subject forward is to emphasise the fact that in certain cases, *not in all*, enormous benefit can be conferred on patients by the removal of nasal obstructions, and I think that it will be allowed that if in a few only there is cure, yet in a large majority considerable relief is obtainable by suitable surgical measures; that it may be laid down as beyond dispute that (1) in young children we may thus prevent deformity of the chest with its attendant evils, marasmus and even death; (2) that in youth and early adult life we may prevent permanent deformities of the chest, deafness, impairment of speech and of the mental faculties; and (3) that in adult life we may prevent and even in some cases, cure asthma, spasmodic cough, bronchitis, emphysema, intellectual hebetude and melancholia &c. I have omitted the considerations of many forms of stenosis such as occur in the course of diphtheritic rhinitis, primary

syphilis of the nasal mucous membrane, tuberculous rhinitis, intra-nasal lupus, glanders and others, in which the disease is more important from its constitutional than from its local manifestations, because in them the obstruction is generally of secondary interest, and also because local treatment alone will be of little avail. At the same time, it is well to bear in mind that the same principles will apply to them as to the others, and the neglect of local treatment directed against narrowing of the breath passage will nullify much of the good effect otherwise to be obtained by skilfully directed general therapeutics.

In conclusion, I wish to make it clear that while I insist on stenosis being an important factor in many of the remote effects sometimes called reflex neuroses, I by no means wish to exclude the other factors. I think that in most cases of asthma, laryngeal cough and spasms there is a clear neuropathic element, without which the local obstruction will have no effect; and I also believe that in some cases, such as those of hay asthma, a hyper-sensitive condition of the respiratory tract (and of the nose as part of that tract) is much more likely to be the starting-point of the remote effects than mere obstruction, though there seems good evidence that, even in these cases, obstruction aggravates the condition. All that I contend for is that intra-nasal obstruction is often an important element in the class of cases referred to; that it is often overlooked, or, if found, despised or made light of; and that it certainly should be sought for and dealt with by local treatment in a very large class of diseases in which, up to quite recently, its influence has been more or less ignored.

Henrietta-street, W.

## ON THE PATHOLOGY OF SYPHILIS:

A THEORY FOUNDED ON A CONSIDERATION OF COLLES' LAW AND OTHER PHENOMENA OF THE HEREDITARY DISEASE.

BY ARTHUR H. WARD, F.R.C.S. ENG.,  
SURGEON TO THE OUT-PATIENTS, LONDON LOCK HOSPITAL.

MANY of the clinical phenomena of syphilis are very obscure in etiology, and none more so than those connected with the hereditary form of the disease. I advance the following hypothesis as explaining several of these obscure conditions, as inherently reasonable and as falling into line with recently acquired knowledge.

It is generally admitted that syphilis must be caused by the growth of a specific micro-organism in the fluids of its victim. This organism is probably a bacillus and kindred to those of the other diseases characterised by the formation of infective granulomata. My hypothesis is as follows: (1) That the bacilli of syphilis produce, as a condition of their existence, a toxine, this toxine being probably an albumose of like nature to those isolated from cultures of tubercle and anthrax bacilli; (2) that when this toxine is present in the human body in small, slowly-increasing quantities, toleration is established and immunity acquired; (3) that this toxine is the active cause of the phenomena of syphilis.

This theory would seem to explain with singular completeness the following clinical facts:—

(a) *Colles' Law*.—Colles pointed out in 1837 that the mother of a syphilitic child, although she herself never presents any sign of the disease, cannot be infected by direct contact with the child, but that a healthy wet nurse would be infected by the same child, and would develop a nipple chancre and general syphilis. This observation has never been disproved. In these cases, as the mother shows no signs of the disease at any time, the child must inherit directly from the father. Cases are recorded in which the mother, marrying again a healthy man, has had perfectly healthy children.<sup>1</sup> The child then inheriting from the father must harbour bacilli from the first. These bacilli must produce their specific toxines; at first, when the ovum is small, in minute quantities; later, when the ovum affords a larger field for their development, in increasing amounts, up till the time of birth. But toxines are crystalloid bodies. Therefore the toxine of syphilis must tend to pass by osmosis into the maternal circulation, while the bacilli must remain in the foetal fluids. This being so the toxine escaping must be limited in amount, and probably would never be abundant

<sup>1</sup> Bumstead and Taylor.

enough to cause symptoms in the mother. But it might easily be enough to establish toleration in the mother and render her immune. This is precisely the result that occurs in Colles' law; the explanation being that the mother's phagocytes have become tolerant of the toxine by prolonged exposure to small quantities. So when fresh germs are implanted from the child's mouth and form their toxine, the mother's phagocytes are not paralysed, but advance to the attack and destroy the invaders. If the mother is not protected, it is hard to see how any woman can fail to be infected by the blood of the child at the moment of the separation of the placenta. Conversely, when the mother is infected during gestation, how can the child escape infection during the laceration of the placental villi, unless it is rendered immune by toxine from the mother? But as in this case the child rarely becomes infected (Lusk), surely it must be protected. If it is "probable" that these (protected) mothers may at a late period suffer from tertiary symptoms (Hutchinson), then the theory that the toxine is the active cause of symptoms receives support. And it is to be noted that their exposure to the toxine extends over nine months. The same argument may apply in those cases of late hereditary disease in which no symptoms were noticed near birth.

(b) Another obscure point in this "strange eventful history" is the fact that syphilitic children are generally born apparently healthy. The bacilli must have been living in the fetus for nine months, yet they produce no symptom whatever, but soon after birth an outbreak occurs. The theory accounts for this, and here lies the chief reason for thinking that the toxine is the active cause of symptoms. During intra-uterine life the toxine must be always escaping by osmosis. The maternal circulation is much the larger; therefore the fetus must eliminate a large proportion of the toxine formed in its tissues. This elimination must favour the growth of the bacilli, but for all that they produce not the slightest effect, and the child is born looking the picture of health—that is, the child is unaffected as long as elimination can go on. At birth this safety valve is closed and the toxine must begin to accumulate. If it is the cause of symptoms, something must soon happen. Surely enough, in a few weeks the child "falls off," becomes sallow and weakly, and develops manifestations of the disease. If the bacilli are the cause of symptoms, why do they make no sign for nine months? If it is the toxine, everything is plainly accounted for.

(c) Again, those cases in which the child is not born healthy or dies *in utero* are also covered by the theory. During foetal life many things might interfere with elimination by osmosis. The most important cause must be syphilis on the mother's side as well. Then the toxine would be produced on both sides of the placental membrane, and it must depend on the amount of toxine in the mother's blood, whether the fetus manages to eliminate much or little—or, indeed, any—of its own toxine. Here is a varying cause for the various clinical effects. If the mother's disease were acquired soon before or at the time of conception, then one would suppose the fetus would be able to eliminate but little toxine, and that that remaining would wreak itself on the embryonic structures, causing death. So it happens. Recently infected mothers rarely give birth to a viable fetus (Zeissl). If the child gets rid of enough toxine to survive, it is either born with marks of disease or choroiditis, or else puny and weak, with a tendency to early pemphigus, cachexia and death. These severe and early symptoms must be due to the large amount of toxine in the foetal tissues. At birth signs of depressed vitality are apparent, and little time is required for accumulation of toxine, before violent manifestations occur.

(d) The occurrence of placentitis gummosa and placental degenerations and hæmorrhages, said to occur only in foetal syphilis (Fränkel), may easily be due to constant irritation from the passage of the toxine from the child to the mother.

All these considerations taken together seem to afford a strong argument in favour of the above theory. Indeed, taking also general considerations of kindred questions into account, it would seem perhaps convincing. Once admitted, simple explanations of the phenomena of the acquired disease are to hand, and light is thrown into many dark corners. We have also discovered an instructive object-lesson, perhaps almost the only one in nature, of the processes establishing toleration and producing immunity.

Hertford-street, W.

## "THE ETHICS OF OPIUM AND ALCOHOL."

By ROBERT PRINGLE, M.D. EDIN.,  
BRIGADE SURGEON, BENGAL ARMY.

OF all the statements advanced by pro-opiumists none, I believe, have carried more weight, both with the professional and unprofessional public, than Dr. Mouat's article in THE LANCET of April 30th last on the Ethics of Opium and Alcohol. Following, as it did, so soon after the meeting at the Society of Arts, it seemed to confirm the statements of the majority at that meeting, and made not a few anti-opiumists reconsider their position, and one, a professional man, delivered a sharp attack on the position of the anti-opiumists, based on the apparently authoritative statements made by Dr. Mouat and the startling facts alone deducible from them. At the time I could only say that, as one who had served under Dr. Mouat as medical officer of two gaols in Bengal, I was quite at a loss to know how he could make these statements, in the absence of any column in the mortuary returns in which deaths from opium, as those from alcoholism subsequently, could be entered, and I reserved all future remarks till I had had an opportunity of examining the gaol returns for the periods in question and the report specially alluded to by Dr. Mouat. This I have now done, and the result is that Dr. Mouat's statements, in my opinion, are in the main points at issue—viz., the harmlessness of the opium habit, and the practical harmlessness of withholding the drug from confirmed opium eaters "even in the notoriously opium province of Assam"—distinctly contradicted by paragraphs in an official letter, and the reports of medical officers of standing and local experience.

As regards the anti-periodic virtues of opium in the treatment of malarial fever, by a strange coincidence I found a special report of Dr. Mouat's on Malarial Fever, in which he enters most fully into the subject and records his own views on the types of "marsh fever." Further, in the remedies Dr. Mouat advocates, while giving quinine in the first place, he distinctly states that there are not a few cases in which quinine is clearly contraindicated and arsenic acts with marked success. Biberine is also alluded to in this class of remedies. But notwithstanding Dr. Mouat believing "it to be undoubted that it (opium) is a valuable febrifuge and pick-me-up in the fevers of all alluvial and marshy soils," no mention even of opium is made in this special report, which I can quite understand, as it would hardly be in keeping with the stringency of the order withdrawing it, even in malarial Assam, though, as the result showed, some ethical and physical "pick-me-up" was necessary. In my search I came across my own report in 1855 on this withdrawal of opium from the prisoners, but the lessons learnt subsequently have convinced me, as they should have done Dr. Mouat—judging from his recorded opinion of the character of the underpaid responsible staff attached to some of the Indian gaols—that the exclusion of opium from an Indian gaol is a question, not of the stringency of a circular order, but of the wealth of the outside relations of the prisoner, as in the case of the gaoler of the Bancoorah Prison (a Eurasian), who refused a bribe of 1000 rupees, when a rupee was at par, to relax the gaol rules in the case of some wealthy prisoners, which faithfulness, by the way, was rewarded by the Government with a watch of the value of 500 rupees. The case, therefore, of the poor opium-shattered paupers whose deaths swelled the death roll of some of the Assam gaols (regarding which the Government called for a special report) was different, and they came under the list of those who, unable to bribe the gaol guard or officials, rapidly succumbed to the strictness of the order withholding opium from them.

To illustrate the impossibility of recording the real cause of death in the absence of a special column for its insertion, I may mention that in a gaol in Assam a death resulted from flogging, and is entered as follows in Dr. Mouat's report for 1867: "The third (casualty), from tetanus, caused by a slight abrasion, the consequence of flogging." Now, with the exception of this notice, I could find no other trace of the true cause of death, though I looked under the head of deaths from violence, as also those from accidents.

Again, under what column are those deaths entered alluded to in a letter to Dr. Mouat from the Secretary to the Govern-

ment of Bengal, dated March 30th, 1864? "A scanty or late supply of clothing to the prisoners is stated to be one of the causes of the heavy mortality in the gaols of Rungpore, ..... Kamroop. It is also mentioned as a cause of mortality in the special reports on the Patna, ..... Subsangar, and Deoghur Gaols." Well may the Secretary add: "The gaol governor is quite unable to understand how officers in charge of gaols can allow such a cause to arise and to affect the health of the prisoners in face of the standing orders of the Government, and of the repeated instructions issued from your (Dr. Mouat's) office."

Yet again, in Dr. Mouat's report for 1866, we read at page 60: "Balasore (Orissa): Here also" (Pooree Gaol noted before) "the debilitated and deplorable condition of the prisoners, from starvation prior to admission, increased the sickness and mortality;" and yet the following is recorded of the gaol staff here: "The prisoners were for some time deprived of the full allowance of food from speculation on the part of the late gaoler and his subordinates, who were all removed."\* So, what with starvation outside and something very similar inside the gaol, little wonder the mortality was 20.73 per cent. Surely, further quotations under this head are unnecessary.

In this manner doubtless numbers of deaths would, or rather should, have been entered under the head of "Opiumism," had there been such a column, as there is for "Alcoholism," for it would be difficult to enter the following under any other head: Firstly, as regards the deaths due to the opium habit itself; and, secondly, to the withdrawal of the drug from those long addicted to its use.

1. As regards those deaths due directly to the opium habit we have the following particulars:—

Kamroop, Assam, 1861: "All but the confirmed opium eaters enter the gaol in good health. The latter are always a sickly set."

Debrooghur, Assam, 1861: "Prisoners generally healthy on admission, with the exception of the opium eaters."

Subsangar, Assam, 1862: "The sickness and mortality had increased during the year. Nearly all the deaths were from dysentery in worn-out opium eaters."

Kamroop, Assam, 1863 (Dr. Mouat's inspections, Dec. 28th, 1863, and Jan. 20th and 21st, 1864): "I [Dr. Mouat] am inclined to attribute the great sickness to the filthy water used for cooking and drinking, the tanks from which they were taken having been in an extremely dirty and unwholesome state."

Kamroop, Assam: "The mortality had diminished considerably, and was about that of the decennial average. Bad drainage and opium eating were assigned as the causes of the large amount of zymotic diseases still prevailing in this gaol."

Subsangar, Assam (inspected by Dr. Mouat on Jan. 12th, 1864): "Showing a considerable increase of mortality, attributed by the medical officer to the admission of a large number of sickly men and drunkards and opium eaters, and in part to them being employed in preventing the collapse of the bank of the great tank, in the performance of which they were exposed for hours to cold and wet. It was, unfortunately, a work of necessity, and no free labour was procurable."

Debrooghur, Assam, 1865: "The casualties among the latter class (local prisoners) were confined to old opium eaters."

Subsangar, Assam, 1865: "The subjects of almost all the fatal cases were absconded coolies from the tea gardens ..... their health broken down with intemperance, privation and anxiety."

2. The effects of withholding opium from these people were as follows: "He (the civil surgeon) ascribes the deaths from dysentery to the circumstance of the prisoners, natives of Assam, being deprived in gaol of opium, which they consume in large quantities while at large (some took as much as 80 grains per day), and for which they crave and pine in confinement."

Kamroop, Assam, 1865: "At Cherrapoonjee the average number in confinement was so small as to influence the death-rate in a marked manner, seven having died among an average strength of twenty-three. The deprivation of exercise in the open air and of opium, to which the people of Cherra are accustomed, is stated to have enhanced the death-rate."

The late Dr. Norman Chevers, unquestionably the highest Indian authority on medical jurisprudence and kindred subjects, when acting for Dr. Mouat, as the result of his

inspection of the gaols of Lower Bengal, writes thus of those of Debrooghur and the Kassiah Hills (date of inspection Dec. 29th, 1865):—

Debrooghur: "The five deaths of Assamese prisoners from bowel disorders were confined to old opium eaters, who rapidly succumb to disease when deprived of the drug."

Kassiah Hills (inspected Jan. 31st, 1866): "The heavy mortality of the year is stated by the civil surgeon to have been due to the Cassiahs being deprived to some extent of out-door open-air exercise to which they are accustomed, and of the drug opium, which is almost the staple part of their living when free."

In the following year (1866) Dr. Mouat resumed charge of his duties, and in his report for 1866 writes as follows of Bograh, Bengal:—"The death-rate was, however, more than double that of the preceding year, and was due to the majority of the casualties having occurred in men whose health was bad on admission, who were aged and worn out from long suffering and were addicted to ganjah or opium."

Subsangar, Assam: "The general health of the prisoners was not good; the mortality, though lower than that of the previous year, was still high. The same causes as those mentioned in the report of the preceding year—viz., the reception into gaol of sickly Bengali emigrants and old opium eaters—are stated to have operated in producing the high death-rate of last year."

Kamroop, Assam: "The mortality of 1866 was considerably below that of the previous year, yet higher than the average of the past quinquennial period. Thirty-one of the thirty-nine casualties were from dysentery, attributed principally to the sudden stoppage of opium, to which the prisoners are subjected on conviction. A large percentage of Assamese consume about 100 to 150 grains daily of solid opium, and its sudden discontinuance, coupled with the complete change of diet, affects the digestive organs materially. The conservancy arrangements were satisfactory. The stoppage of the opium was injudiciously and improperly managed, and the diet seems to have been equally ill dealt with. I am in communication with the medical officer on the subject."

Bograh, Bengal (Dr. Mouat's report for 1867): "The increase of mortality was slight, and was due entirely to all the five casualties of the year occurring in persons whose state of health was bad on admission, and to three of those who died being more over-aged and addicted to opium and ganjah smoking."

Durrung, Assam: It is stated "that the frequent use of *dhal* causes indigestion, especially among opium eaters."

Debrooghur: "Two casualties occurred in worn-out opium eaters. These and a death from bronchitis were the mortality proper of the gaol."

In this year (1867) nothing is said about the opium habit or its withdrawal, but the present doctor, it is hoped, will correct all the "grave irregularities"; while the following is recorded of a previous doctor that there was a "total neglect of all sanitation by the medical officer, which I observed at my last visit to this gaol"; and yet on a reference to the report of 1866 on the Kamroop Gaol we read: "The conservancy arrangements were satisfactory."

It is due, however, to Dr. Mouat to say that in this category of reverse criticisms of his action in withholding opium from the prisoners in Assam the report of one officer, an apothecary in charge of a gaol (that of Kamroop, strange to say), is entirely in favour of this measure.

Kamroop, Gowhatty, Assam (report for 1855 by G. Simons, apothecary): Diet—"Although some of the men frequently complain of the quantity not being adequate for them, but from the sleek appearance maintained by them after they have been some time in prison it is probable that the clamour they make for an extra quantity is to enable them to dispose or barter it for the purchase of opium."

Kamroop (report for 1856-57; Apothecary Simons in medical charge): "The sudden stoppage of opium appears not only to have been unattended with injury, but to have diminished bowel affections among those previously addicted to the use of that drug. The change for the better in the health of the prisoners is also attributable in a great measure to the care bestowed on the selection of the food ..... the stoppage of the use of opium amongst the convicts has also had a marked good effect, all of which, added to the prompt attention given to cases of sickness by the medical officer, Mr. G. Simons, by whom most of the above reforms were suggested, had quite altered the character of the gaol, which

for healthiness would now not contrast unfavourably with any other in Bengal."

The following is the death-rate for five years in the Kamroop gaol: 1851-52, 12.60 per cent.; 1852-53, 10.90; 1853-54, 10.37; 1854-55, 8.10; 1855-56, 7.50; or for five years nearly 10 per cent. a year. "The health of the prisoners has decidedly improved, which Mr. Simons attributed in some degree to the entire stoppage of opium, an experimental measure which he had adopted at my request."

Debrooghur (Dr. Mouat's report for 1859-60): "The majority of the prisoners admitted are confirmed opium eaters, who are said to improve rapidly in health from the discontinuance of the drug."

I feel no apology is necessary for these copious extracts, the whole case rests upon them, and I think fully justifies the terms used in my letter to Dr. Mouat alluded to hereafter. In that letter I state that "I think it but fair to tell you that a careful examination of the gaol reports while you were Inspector-General of Prisons, Lower Provinces, does not bear out your remarks in your article in THE LANCET of April 30th, 1892." I am well aware that a speaker at the late discussion on "The Opium Question" at the Calcutta Medical Society said: "Although no deaths could be attributed to opium, the opium eater, he (the speaker) thought, died of intercurrent diseases." Now if we bring the same law to bear on this subject which has compelled the profession to insert a column, even in India, for *alcoholism*, it seems to me that if one for "opiumism" had been added these deaths should undoubtedly have been classed under it.

It cannot fail to be noticed that I have omitted all allusion to the "ethics" of alcohol as compared with the "ethics" of opium. This omission is intentional, for I dispute the feasibility, much less the possibility, of any comparison being instituted, even allowing there were "ethics" in either. For instance, it entirely presupposes that there is an alcoholic habit in India similar to that met with in this country. Now to those who know anything of the character or customs of the natives of India, who indulge in alcohol, it will be evident that there can be no alcoholic habit such as there is in this country. True, since this country assumed the direct government of India in 1858 a steadily increasing effort has been made (chiefly, however, in Lower Bengal) to introduce, or, perhaps better, to excite, this habit by placing grog-shops in many cases near roadside wells or even factories and tea gardens, as a kind of public-house arrangement; but it has failed signally, as those know who have studied the subject, as in every district there are certain grog-shops specially selected by the native drinker, where he goes to indulge his alcoholic habit, if such it can be called, by getting drunk, his bargain being, "How much will you charge to make me drunk?" Here, alas! lies the secret of much of the madness supposed to be due entirely to alcohol, but it is to be feared mostly traceable to the pernicious ingredients too often used to reduce the liquor drunk and expedite the drunkenness. Little wonder that, with this tendency and the moral degradation evinced in the use of these "maddening drugs," the outstill system of "ever-at-hand" and cheap liquor of Bengal in 1878, and in the North-West Provinces also, as I know, the natives went down before a flood of drink, in Bengal especially, the appalling extent of which demanded a special commission, which revealed all. Those who know the extent to which this drunkenness spread when fostered by the system I have described, and the awful moral and physical consequences of it, can well be excused for dreading its recurrence; but surely such will never again be allowed to disgrace our rule. Yet, if it is thus equally incorrect in theory as it is in practice to draw any comparison between the opium and alcoholic habits, so it would be to affirm of the natives of Bengal that, if deprived of opium, they would take to alcohol, as they did under the melancholy and disastrous system of outstills and cheap liquor.

In a remarkable article in *The Times* of June 13th, under the heading of "Indian Affairs," written by Sir William Hunter, K. C. S. I., Dr. Mouat's article under notice is used as the convincing proof and evidence, not only of the harmlessness of the opium habit, even among the class from which Indian prisoners are drawn (without excepting "the notoriously opium province of Assam"), but of the similar harmlessness and, I may add, facility with which it can be given up even in the case of the most confirmed victims of the habit. This, however, with Sir William Hunter's statement in that article, regarding the absence of deaths under the car of Juggernaut, unconnected with crowds "in narrow

lanes," which from personal knowledge and observation I can give an unqualified denial to, must now be handed over to that category of *statistical conclusions* the refutation of which can be summed up in the remark that they are on close investigation not only totally unsupported by facts, but actually contradicted on unquestionable evidence.

Before I close I would take this opportunity of thanking Dr. Mouat for his courtesy in replying so fully to my letter alluded to before, asking him for a copy of his circular to medical officers in charge of gaols, containing his instructions regarding the method to be adopted by which this withholding of opium can be done "without any injury," as after a most careful search I could not find it, though it is alluded to when an explanation is submitted by Dr. Mouat regarding the increased rate of mortality stated by some medical officers to be due to this withholding of opium. Dr. Mouat, in reply, regretted he was unable to send me a copy of the circular, though, he added, it must be among the records of his office when he held the post of Inspector-General of Prisons in Bengal. The action of Dr. Mouat is in striking contrast with that of Sir William Hunter, to whom I wrote asking for his authority for his statements regarding what he was pleased to describe as "missionary misrepresentations" respecting the circumstances attending the worship connected with the festival of the car of Juggernaut, and which he mixed up in a strange way with the opium question, describing it as "a mistake about the use of opium curiously like that which their (the less-instructed missionaries) predecessors made in regard to the worship of Juggernaut." No reply was vouchsafed to my letter, though I supported it by the fact that I was present at Juggernaut as civil medical officer when the dead, the dying and the maimed were dragged from under the car of the idol, and that I operated on some of these poor mangled victims. *The Times* refused to insert my letter giving an unqualified denial to the statements regarding the car festival of the idol of Juggernaut if it related to the headquarters of the worship at Pooree or Juggernaut, so "*The Times* reading world" must, alas! view the injurious effects of the opium habit and the difficulty of abandoning it in much the same light as it is asked to view the bloodstained wheels of the car used in the worship of "gentle and merciful" Juggernaut—viz., as missionary misrepresentations.

Blackheath.

## THE REMOTE EFFECTS OF PERITONEAL ADHESIONS CONSEQUENT ON REMOVAL OF THE OVARIES.

BY JOHN PHILLIPS, M.A., M.D. CANTAB., F.R.C.P. LOND., ASSISTANT OBSTETRIC PHYSICIAN TO KING'S COLLEGE HOSPITAL; PHYSICIAN FOR IN-PATIENTS TO THE BRITISH LYING-IN HOSPITAL.

UNDER the above title I purpose to draw attention to the results of localised peritonitis (chiefly as fibrinous bands or adhesions) upon the intestines at a long period after the operation for the removal of diseased ovaries. Many valuable contributions have already been made on the question of obstruction of the intestines by recent adhesions, and it is but necessary to refer the reader to the monographs of Hirsch,<sup>1</sup> Nieberding,<sup>2</sup> Obalinski,<sup>3</sup> Meredith,<sup>4</sup> H. Jones,<sup>5</sup> Thornton,<sup>6</sup> and others, in order to show the reality of the danger of such cases. It is only during the past few years that the existence of this condition has been satisfactorily demonstrated, for, with the exception of two or three short papers on the subject under consideration, nothing has been published during the past decade. Having met with a very interesting case bearing on this question I have appended full particulars and a sketch of the parts.

CASE 1.—K. H—, aged twenty-seven, single, first consulted Dr. J. N. Miller in June, 1890, for profuse menorrhagia and dysmenorrhœa, attended by much sickness. Her condition was found to be anæmic, but nothing could be made out to account for her symptoms except some enlargement and tenderness of both ovaries, which were also slightly prolapsed. The menorrhagia continuing in spite of rest and treatment, an anæsthetic was given and the cervix dilated, but nothing

<sup>2</sup> Centralblatt für Gynäkologie, 1888, Bd. xii., s. 183.

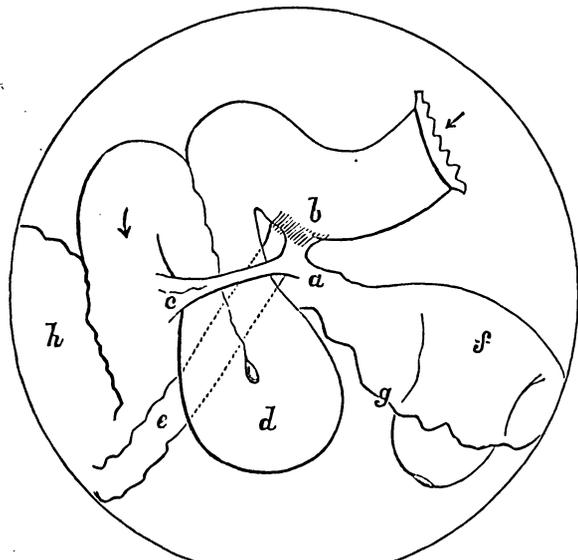

<sup>3</sup> Berliner Klinische Wochenschrift, 1889, No. 12.

<sup>4</sup> THE LANCET, vol. i. 1889, p. 641. <sup>5</sup> Ibid., vol. ii. 1889, p. 894.

<sup>6</sup> Medical and Chirurgical Transactions, vol. lxx., p. 68.

was found abnormal in the uterine cavity. A ring pessary was inserted to support the ovaries, but gave no relief. The anæsthetic (chloroform) caused violent retching and sickness, which lasted for several days, during which time she was fed per rectum. In September she again came under observation, the hæmorrhage being now continuous and confinement to bed compulsory by reason of the pain and sickness. It was then felt that nothing except the removal of the ovaries would give any chance of relief. I saw her with Dr. Miller on Nov. 14th, 1890, and, considering what had been done and the patient's then condition, I concurred with him as to the propriety of the operation. He accordingly removed both tubes and ovaries on Dec. 6th. She went to Eastbourne on Feb. 3rd, 1891, and was seen by Dr. Miller in the May following. There had been moderate metrostaxis two months after the operation, without any pain, and, except for severe flushings and other nervous feelings, she felt much better; the sickness had entirely ceased. Constipation troubled her as before the operation, and was combated by full doses of cascara. During the summer she continued to improve, was able to walk four miles without fatigue, and she considered her condition more satisfactory than it had been for several years. She had slight hæmorrhagic discharge on three occasions up to October, but without pain or discomfort. In November and December she was under treatment for violent cutting pains in the lower abdomen and of increasing constipation, requiring large doses of aperient medicine to overcome it. On Dec. 17th she was seized with severe pain and sickness, and was found in bed, with a temperature of 102°, much abdominal pain, and constant vomiting. The bowels were confined, the abdomen not distended, but there were great tenderness and some fulness over the region of the cæcum. Nothing abnormal was revealed by vaginal examination. She was treated by the usual rectal injections and other remedies, and for a few days she improved; the temperature became normal, the sickness ceased, and the bowels acted; the pain and tenderness over the cæcum and right side of the abdomen, however, continued. On Dec. 27th the bowels acted freely; but, instead of giving relief, the act was followed by aggravation of all her symptoms. The temperature fell to sub-normal, and she died from exhaustion, in great pain, after sixteen days' illness.

*Post-mortem examination.*—On opening the abdomen no general peritonitis was found. The appended figure will give

(Semi-diagrammatic.)

*a*, Right uterine stump. *b*, Attachment of appendix and commencing peritonitis. *c*, Adhesion between intestine and stump. *d*, Incarcerated knuckle of intestine. *e*, Appendix vermiformis. *f*, Uterus (anterior surface). *g*, Peritoneal edge (cut). *h*, Cæcum. It will be thus seen that the adhesion and displaced appendix vermiformis enclosed an elongated slit between them, through which a knuckle of intestine had obtruded itself and become incarcerated.

quarter long was found extending; it was broader at the intestinal end and thinned off to a point at its insertion into the uterine stump. Immediately below this was a knuckle of small intestine eight inches in circumference (*d*), dark and congested, but not of a chocolate colour. Beneath the intestine, again, was found the vermiform appendix (*e*), much thickened and three inches and a half long; it was in a condition of almost extreme tension; its distal extremity was attached just above the uterine stump to the small intestine, and peritonitis was just commencing there (*b*).

**CASE 2 (Macready?).**—This has an important bearing on Case 1. The patient suffered from colicky pains more or less continually after ovariectomy seven years before, and had had an attack of total obstruction for fourteen days two years after the operation, which, however, yielded to palliative treatment. Macready operated for a second attack of obstruction seven years after ovariectomy, fecal vomiting being present. The adhesions were on the right side. Four deep and another still deeper were found constricting the intestines by passing from one loop to another; these were divided, and as the patient recovered the exact site of attachment could not be accurately made out. In the author's own words, "this is one of the remote consequences of ovariectomy."

**CASE 3 (Shively<sup>8</sup>).**—The patient was forty-five years of age; ovariectomy was performed four or five years before, since which time she has been constipated and has had periodic attacks of colic, which usually gave way to subcutaneous injections of morphia. She took a dose of cathartic pills one morning shortly before her illness began, and a good action had taken place; colicky pains, however, ensued in the evening. The pain increased and sickness began, but no tympanites appeared; long tube enemata were given repeatedly, but no further action took place. The vomiting and pain increased, and the patient died after seven days' illness.

The post-mortem examination revealed a complete key to the illness. "There were extensive adhesions of the intestines to the sides and posterior wall of the abdomen, binding them firmly down." This was doubtless the reason for the non-appearance of tympanites. A portion of ileum eighteen inches above the cæcum was adherent to and incorporated with the cicatrix of the wound of the previous ovariectomy. "Around the short portion, between this and the cæcum, a loop of small intestine was twice twisted, forming a kind of knot," and a complete occlusion was thus produced. The direct cause was doubtless the cathartic given on the morning of the commencement of the illness, possibly assisted by some favourable position assumed by the body.

We have therefore three distinct varieties of causation of intestinal obstruction after ovariectomy: (1) When the adhesion arises from the stump; (2) from the cicatrix of the abdominal wound; (3) from intestine to intestine. The small intestine, in consequence of its greater mobility, is liable to form adhesions with any abraded surface; hence we find them more common in connexion with the small than with the large intestine. Martin of Berlin has proved, as the result of observations on second operations on the same patient, the presence of slight non-septic peritonitis as the immediate effect of every ovariectomy. The colicky pains which patients often suffer from after ovariectomy, and complicated with constipation, are due to small peritonic adhesions the result of this localised non-febrile peritonitis. Hunter<sup>9</sup> has devoted a paper to this subject and it is well worthy of perusal. If the prevention of formation of adhesions could be arrived at for forty-eight hours after operation, our position would be a more favourable one. In an interesting paper by Dr. R. T. Morris<sup>10</sup> on this subject he declares that he has completely demonstrated the fact that an application of a film of aristol to the stump prevents secondary peritoneal adhesions; he experimented on rabbits and relates one case of abdominal section in the human subject. The above facts seem to point strongly to the desirability of our knowing the subsequent histories of those patients whose cases fill the long lists of ovariectomies published from time to time and classed as complete successes.

#### CASE OF RADICAL CURE OF INGUINAL HERNIA BY HALSTED'S METHOD.

BY FREDERICK PAGE, M.D. EDIN., M.R.C.S.

A PLATELAYER, aged twenty-five years, was admitted into the Royal Infirmary, Newcastle-upon-Tyne, on June 13th last, for the purpose of undergoing an operation for the radical cure of an oblique hernia on the left side. The ring admitted three fingers, and trusses failed to keep the hernia up. On June 18th Halsted's operation was performed as thus described by him in the Johns Hopkins Hospital Reports for March 1st, 1891: "The skin incision extended from a point about two centimetres internal to the anterior superior spine of the ilium to the spine of the pubes. The subcutaneous tissues were divided so as to expose clearly the aponeurosis of the external oblique muscle, the external abdominal ring and the sac of the hernia. The aponeurosis of the external oblique muscle, the internal oblique, and the transversalis muscles and the transversalis fascia were severed to the outer extremity of the skin incision. An incision large enough to admit two fingers was then made into the sac. The index and middle fingers of the left hand with a small piece of sterilised gauze were passed into the sac. By them the hernial contents were passed back into the abdominal cavity, and over the fingers the sac, first on one side and then on the other, was drawn tense and held by the thumb of the same hand, while the tissues in which the sac was embedded were stripped off from it by the other hand. With the division of the abdominal muscles and transversalis fascia the so-called neck of the sac vanishes. There is no longer a constriction of the sac. The communication between the sac and the abdominal cavity is more than large enough to admit one's hand. The sac, having been completely isolated, was torn more widely open and the peritoneal cavity was closed as deeply as possible by seven or eight quilted sutures of fine silk. The sac was then cut away quite close to the line of the peritoneal sutures. The vas deferens and its vessels having been isolated, they were hooked up into the outer angle of the wound by a quilted suture, which included the transversalis and internal oblique muscles and the aponeurosis of the external oblique muscle. This suture was the first of a row of seven or eight quilted sutures of strong silk, which were passed deeply through the pillars of the ring and through the divided muscles of the abdominal wall. These sutures were taken very close together, were made to include the deepest tissues available, and were tied tight enough to bring into close apposition the broad surfaces which they embraced." The wound was powdered with boracic acid and covered with gauze and cotton-wool. No constitutional disturbance followed the operation. June 25th: The wound was examined for the first time and found to be healed throughout. July 14th: Patient was discharged, wearing no truss, and he remains free from any inconvenience.

Halsted's operation differs from Bassini's, as described by Mr. Hulke in a clinical lecture reported in THE LANCET of July 16th last, in only one, but that a very important, particular—the transplantation of the cord. By every other method the canal is left occupied by the cord and recurrence is common; but by Halsted's the canal is obliterated and the external abdominal ring completely closed, the cord lying between the skin and the aponeurosis of the external oblique muscle. Recurrence is far less likely to occur, and Halsted reports twenty-one cases operated upon by him as permanently cured. It is premature at this date to say the case now reported is permanently cured. It appears to be so. Halsted's operation does not seem so far, in this country, to have received the amount of attention it deserves, and my chief object in publishing the above case now is to direct attention to this method.

Newcastle-on-Tyne.

#### AN INSIDIOUS CASE OF CIRRHOSIS OF THE LIVER RAPIDLY FATAL FROM MELÆNA AND HÆMATEMESIS.

By SURG.-LIEUT.-COL. S. L. DOBIE, L.R.C.P. EDIN. &c.,  
SUPERINTENDENT OF THE GOVERNMENT ASYLUM, MADRAS.

MR.—, a tall, gaunt European, aged forty, was admitted into the Madras Lunatic Asylum on March 17th last, suffering from melancholia. He had a previous history of intemperance, with an attack of delirium tremens last January. For the last twenty years he had led a rough life in India, with much hard work and exposure to the sun, and he had suffered a good deal from malarious fever. Until the advent of the illness which ended in his death he had no physical symptoms of ill health beyond a certain amount of emaciation. There was a general pigmentation of his skin, supposed to be due to constant exposure to the sun, which gave him a light-brown colour. His melancholia was not very pronounced or and was associated with certain delusions. He went to bed on July 11th apparently in his usual health. He had eaten his food properly during the day, having complained of nothing and having talked rationally about business matters. The next morning, about six o'clock, he was found lying in bed half conscious, with dilated pupils and feeble pulse. He was found to have passed a tarry motion in the bed. He remained faint and barely conscious during the forenoon of July 12th, and at midday passed a large offensive motion of tarry constituency. At 2 P.M. a more liquid motion of dark blood was passed, and at 3 P.M. there was an escape of fluid blood from the mouth and nose. By this time he was restless, frequently yawning, and occasionally sighing. An examination of the abdomen in the hepatic and epigastric regions caused a tendency to vomit. By the evening he had sunk into a state of complete unconsciousness, and remained in the same state all night. On the morning of July 13th he again passed blood by the bowel, and a small quantity escaped from his nose and mouth. He lay on his back quite insensible, breathing hard, and shortly after midday on July 13th he died, the time between the first apparent symptoms and death being from thirty to thirty-six hours.

At the post-mortem examination, which took place three hours and a half after death, all the organs were found blanched. The stomach and the intestines from end to end contained blood fluid or in clot. The capsule of the liver was adherent to the diaphragm and neighbouring organs. The liver itself was slightly contracted and weighed three pounds and a half. It was not hobnailed, but there was a great increase of fibrous tissue in Glisson's capsule, so that the hepatic lobules were encroached upon and the proper parenchyma of the liver much lessened. The condition seemed to be one of cirrhosis in course of development. The spleen was enlarged, weighing two pounds six ounces, and was hard and fibrous. The state of the other organs offered nothing of importance to record.

Whatever interest this case possesses lies chiefly in the insidious nature of the disease and its rapidly fatal course from the first appearance of the hæmorrhage. I do not think that the physical condition before the supervention of hæmorrhage was masked by the mental disease, for the melancholy was not profound and he would have been likely to have complained of any bodily ailment from which he might have been suffering.

Madras.

#### FATAL CASE OF ASPHYXIA IN AN INFANT FROM FOREIGN BODY IN OESOPHAGUS.

By C. H. MOILRAITH, M.A., M.B., C.M. GLASG.,  
RESIDENT MEDICAL OFFICER, CHILDREN'S HOSPITAL, PADDINGTON, W.

I THINK the following notes may probably be of interest to readers of THE LANCET.

A child, G. B.—, aged seventeen months, was brought to the Children's Hospital, Paddington, in a state of asphyxia. The history was to the effect that while at dinner, and having a piece of meat in his mouth, he had a sudden fit of coughing, following on which he became rapidly blue in the face and almost stopped breathing. There-

was no account of the size of the piece of meat swallowed. He was taken at once to a doctor, who was not at home. He was then brought to the hospital, about twenty minutes after the accident happened. On arrival the child lay motionless; its face was turgid and livid, the veins over the head distended, and its eyes prominent. There was very shallow breathing, of a stridorous character. The breath sounds were feeble over the right lung and almost absent over the left. They were accompanied by some stridor on inspiration, and expiration was prolonged and wavy. The fauces were rapidly examined, and nothing being found there, tracheotomy was at once performed. There was then some feeble respiratory effort, the stridor still being present. An examination of the trachea was made; but the child having ceased breathing, artificial respiration was employed, but with no avail.

On post-mortem examination the veins all over the body were found full of dark fluid blood. The lungs were violet in colour, the left one being collapsed, the right one somewhat distended. The veins over the heart were prominent; the right side of the heart was full of dark fluid blood. In the œsophagus, immediately behind the bifurcation of the bronchi, at the level of the body of the fourth dorsal vertebra, there was found, tightly impacted, a hard piece of gristle, measuring an inch and one-eighth long, three-quarters of an inch broad and half an inch thick. It weighed fully a quarter of an ounce. It was pressing on both bronchi, so as to almost totally occlude the left and partially the right. In front of the bronchi were the arch of the aorta and a very large thymus gland pressed close against it by the sternum. The position of the foreign body, the symptoms of obstruction of the trachea to which it gave rise, and the method by which those symptoms were produced as revealed at the necropsy, seem worthy of note.

#### TRANSVERSE PRESENTATION ON TWO CONSECUTIVE OCCASIONS; EVISCERATION; TURNING.

By SURGEON-MAJOR D. C. DAVIDSON, I.M.S.,  
CIVIL SURGEON, SATARA.

On July 22nd, 1889, I was sent for to see a young Hindoo woman, about nineteen years of age, the wife of a farmer, living some miles from Satara, who it was stated had been in labour for some time. On arriving at the house I found the arm protruding from the vagina, swollen and discoloured, with the cutis peeling off. She had been in labour about two days, and the uterus was contracted on the child, which was evidently dead. The patient was put under chloroform and turning attempted; but the child was so firmly jammed down in the pelvis that this was found to be impossible. Evisceration was therefore the only alternative (decapitation being in the first instance impracticable), which, after obtaining the consent of the friends, was performed. The contents of the chest and abdomen being evacuated through an opening in the axilla under the presenting arm, instead of decapitating, which often gives rise to trouble in extraction of the head, I divided the child, leaving one arm and shoulder attached to the head and neck; the lower portion of the body was then withdrawn, and the arm and shoulder, with the head and neck attached to it, easily removed afterwards. The patient made an excellent recovery.

I lost sight of the woman's friends until July 6th of this year, when she was brought to the Satara Civil Hospital, a distance of about five or six miles, suffering again from obstruction. She had, it was stated, been in labour since the preceding day; the membranes had ruptured about midnight. On examination I found the hand and arm presenting, the parts hot and dry and the uterus in a state of tonic contraction. The patient was put under chloroform, and the child, which was dead, delivered by turning. She did well.

*Remarks.*—An unusual feature of this case is the occurrence of an arm presentation in the same patient in two consecutive pregnancies. Evisceration is rightly regarded as one of the most serious and difficult operations in obstetric practice, and the difficulties were not diminished in this case by the operation having to be performed in a small native house, with defective light and on a low cot. Great care was taken to guard against injury to the uterus and soft parts generally, and antiseptic precautions were as strictly carried out as the nature of the circumstances admitted of, to both

of which I consider the complete recovery of the patient was in a great measure due. This is the second occasion on which I have performed evisceration, and each operation was followed by a good recovery.

Satara, India.

Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Proœmium.

### METROPOLITAN HOSPITAL.

A CASE OF CATALEPSY IN A PATIENT WITH GENERAL TUBERCULOSIS.

(Under the care of Dr. C. R. DRYSDALE.)

THIS case is recorded as being a well-marked instance of catalepsy occurring in a male subject who was at the same time affected with extensive organic disease of a tuberculous nature. Mr. Handson informs us he had been greatly subjected to religious influences, having been brought up by priests in a Roman Catholic home from the age of five till twelve; and was said to have had similar seizures before admission, and on one occasion, after recovering from a "fit," to have stated that he was St. Peter. His condition during an attack was not unlike some states of hypnosis, and it is worthy of note that before an attack occurred he would stare long and fixedly at the gas at night, or straight in front of him in the daytime. Mr. Handson considers that his condition might be explained as being due to auto-suggestion occurring in a neurotic subject. In some lectures by Dr. Gowers, which we published in THE LANCET,<sup>1</sup> the condition which this patient manifested is thus explained: "In the hypnotic catalepsy, apparently, the inhibitory action includes all the structures that subserve psychical processes and the lower motor centres are in functional connexion only with the lower sensory centres. The higher controls the lower, and uncontrolled, the lower passes into a state of increased action. This law seems to obtain throughout the central nervous system. The spontaneous activity of the motor cortex, unrestrained, is instantly manifested by the universal increase in normal tone, obeying the laws of the normal adaptation, differing therefrom only in degree. In no other way can we understand the essential features of the phenomena." For the notes of the case we are indebted to Mr. C. P. Handson, house physician.

T. S—, aged fourteen, was admitted into the Metropolitan Hospital on May 10th, 1892. The duration of the illness was uncertain. The boy stated that he had been ill since Christmas, 1890. He had had no previous illnesses. There was no family history of tubercle or of nervous disorders.

On admission the patient was somewhat cyanosed. Tongue moist and pale; pulse 120, very small, but regular; respiration not quickened. There were symptoms of phthisis in the stage of consolidation at the right apex behind and at the left apex in front. Signs of mitral stenosis were apparent and adherent pericardium. No tubercle bacilli were found in the sputum, though looked for on several occasions. The legs were œdematous. The fingers were not clubbed. Urine acid; sp. gr. 1028; very faint trace of albumen. There was nothing abnormal about the liver and spleen.

From the time of admission till the day of death on June 25th the physical signs remained practically unaltered. The temperature, which was of hectic type, ranged from 102° to 95° F. The urine ranged from eight to thirty-eight ounces, but was generally very scanty. During the previous fortnight the boy had moderate diarrhoea. At times he refused all food and was fed by a nasal tube, against which he struggled violently.

May 26th.—Has been delirious all night; tries to get out of bed. Has attacks in which all his limbs on both sides stiffen out. The legs are rigid, but can be bent easily; knee-

<sup>1</sup> Vol. i. 1890, p. 1167.

jerks present; no ankle-clonus. The nurse thinks he understands when spoken to, but he has not spoken this morning.

The patient had improved in general health and had no more attacks till June 8th, when he had a typical cataleptic "fit." The arms were rigid and preferably in the crucifixion attitude described by Charcot. The legs were quite rigid. The limbs remained for a few seconds (the legs for some time) in any position in which they were placed. He was very amenable to suggestions—e.g., on telling him to raise his right leg it was immediately raised to a right angle with the trunk. The limbs could be easily flexed at the joints without using force. The eyes were kept wide open, and the pupils reacted to light. He had a vacant look on his face and stared straight in front of him.

June 10th.—He had two similar attacks last night.

11th.—He has hallucinations at night: sees dead people &c. and screams out.

25th.—Died suddenly after nasal feeding.

*Post-mortem examination.*—Brain: Rather excessive quantity of fluid in lateral ventricles. Convolutions somewhat flattened. No tubercle. Lungs: Chronic tubercular changes at both apices. Heart: Pericardium adherent to chest wall and left lung. Mitral orifice stenosed. Mediastinal and mesenteric glands enormously enlarged and caseating. Mesentery thickened and contracted. Much typical tuberculous ulceration of ileum, lower part of jejunum, cæcum and ascending colon. Large quantity of clear fluid in peritoneal cavity. Liver: Late nutmeg. Spleen hard with old infarct. Kidneys: Papillæ congested; cortex pale.

## ROYAL INFIRMARY, NEWCASTLE-ON-TYNE.

### CASE OF AORTIC, MITRAL AND TRICUSPID STENOSIS.

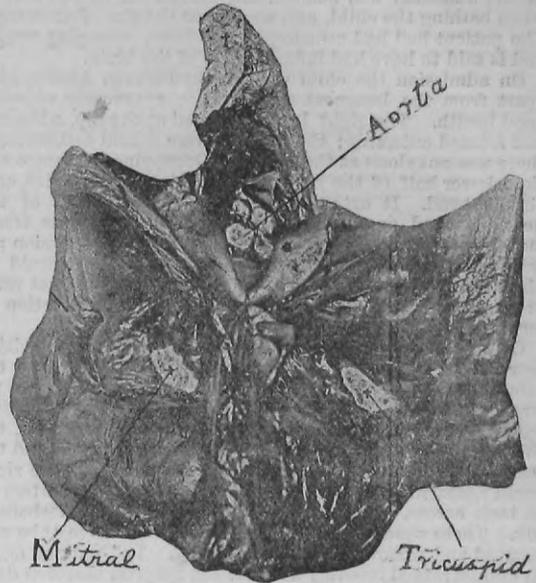

(Under the care of Dr. DAVID DRUMMOND.)

The following case is interesting as illustrating the length of time a heart damaged severely in early life sometimes struggles successfully against enormous odds to maintain a state of efficiency. The illustration (from a photograph taken by Mr. Bolam, student of medicine) shows the contracted orifices, which are rendered visible by clipping away the walls of the auricles and folding down the aorta.

M. B—, aged forty, single, was admitted into the Royal Infirmary for shortness of breath, pain in the epigastrium and œdema of the lower extremities. She was able to earn her living by working by the day at house work until eight months before her admission to hospital, when she was compelled to rest through shortness of breath and recurring attacks of faintness. This illness she ascribed to disturbed nights and extra fatigue consequent upon nursing a bed-ridden mother. For some time previously she had suffered from pain and distension in the epigastrium after food, which increased when she broke down.

On admission the patient appeared to be fairly nourished. The legs were œdematous below the knees. The skin generally presented the faded yellow tint so characteristic of cardiac failure with pronounced tricuspid disease. A bluish-pink flush covered the cheek, the lips were somewhat cyanotic, and the eyes presented the moist, glassy appearance of hepatic engorgement. The pulse was small, rapid (generally about 90), compressible and, as a rule, regular. It gave some, though slight, indications of aortic incompetency. There was marked breathlessness on exertion, a good deal of cough with frothy expectoration, frequent pain in the præcordium, and the usual distressing insomnia. The urine was scanty and high coloured, but only contained a trace of albumen. The heart impulse was considerably extended, and reached to a point about an inch and a half to the left of the mammary line in the seventh interspace. Towards the right it could be felt in the epigastrium and beneath the sternum. A distinct thrill, presystolic in point of time, running up to the apex beat, could be detected, and it was noteworthy that it extended towards the right beyond the usual limits of the thrill in cases of pure mitral stenosis. The murmurs audible at the left apex were a harsh, grinding presystolic, followed immediately by a loud, blowing systolic bruit instead of the usual "snap"; and this in turn was followed by a soft diastolic bruit, which, with the systolic, was conducted towards the axilla. On the other hand, the presystolic murmur was almost limited, towards the left, to the apex beat, though it could still be heard, but faintly, as the sternum was approached. In the aortic area there was a loud systolic

bruit conducted well into the vessels, and a somewhat low-pitched murmur of incompetency, which could be traced down the sternum and towards the left apex beat, in approaching which it was for a short space almost lost, to reappear at the apex and beyond as a characteristic conducted diastolic aortic. The murmurs at the lower end of the sternum in the tricuspid area were a systolic, which could be differentiated from the bruit (aortic) that was conducted into the vessels in the neck, and

a diastolic which seemed to be part and parcel of the murmur of aortic regurgitation. Beyond the fact that the mitral presystolic was conducted further to the right than usual; there was nothing detected by the stethoscope that justified the diagnosis of tricuspid stenosis. The liver was decidedly enlarged, but no hepatic impulse could be detected. The veins in the neck were full; but here, again, there was an absence of the characteristic pulse of back-wash.

For a time rest and treatment by heart tonics gave good results, but the improvement was only temporary, and by degrees the cyanosis, breathlessness and dropsy returned, and she died on June 8th after ten weeks' stay in hospital.

*Post-mortem examination.*—Body œdematous, particularly legs and external genitals. Both pleural cavities contained fluid; the lungs were emphysematous and sodden. The heart weighed 25 oz.; the pericardial membrane and sac were normal; the pulmonary artery stood out prominently and was decidedly larger than the aorta; both ventricles were markedly dilated and hypertrophied; the mitral and tricuspid orifices were contracted and funnel-shaped and admitted the point of the little finger; the aortic orifice was much reduced, admitting an ordinary cedar pencil; its valves were decidedly incompetent; the valves of the three stenosed orifices were glued together and presented ample evidence of old inflammation (probably foetal endocarditis). The orifice and valves of the pulmonary artery were normal, though an old ante-mortem clot extended from the right ventricle into the artery.

## CHILDREN'S HOSPITAL, NEWCASTLE-ON-TYNE.

### DERMOID CYST OF OVARY IN A CHILD SEVEN YEARS AND A HALF OLD; SUCCESSFUL REMOVAL.)

(Under the care of Mr. W. G. BLACK.)

DERMOID tumours of the ovary are said to form about 7 per cent. of all tumours of that organ. Cystic tumours of the ovary are rare before puberty, although sufficiently common afterwards, but may be met with at almost any age. Thus we have recorded in THE LANCET<sup>1</sup> the occurrence of a tumour of the ovary in a child of three years; Dr. Neville<sup>2</sup>

<sup>1</sup> THE LANCET, vol. ii. 1871, p. 850.

<sup>2</sup> British Medical Journal, vol. i. 1880, p. 246.

had a patient under his care at the same age suffering from a similar kind of tumour; and the case of a child aged twenty months,<sup>3</sup> from whom an ovarian tumour was successfully removed, is also described.

M. E. A—, aged seven years and a half, was admitted on April 23rd, 1892, with lameness of right leg and abdominal enlargement. The lameness of the leg began two years and a half ago, six months after an attack of measles. The limb was fixed for some time in a plaster bandage. The swelling in the abdomen was accidentally discovered by the mother when bathing the child, and was about the size of an orange. The patient had had measles, scarlet fever, whooping-cough, and is said to have had inflammation of the brain.

On admission the child was healthy-looking, plump, and, apart from the lameness and tumour, apparently enjoying good health. The right leg was flexed at the hip, adducted and rotated outwards; the muscles were flaccid and wasted; there was ankylosis at the hip-joint. Occupying the centre and right lower half of the abdomen was a tumour, the size of a child's head. It extended two inches to the left of the umbilicus and one inch and a half above it; it was freely movable, smooth on the surface, and dull on percussion; it was surrounded by a resonant area, and the hand could be placed between it and the kidney; there was a distinct wave of fluctuation through it; there was no pain or elevation of temperature. No rectal examination was made.

On May 1st the abdomen was opened by a median incision four inches long, an exploring needle introduced into the tumour, and purulent creamy-looking material withdrawn; a large trocar and cannula was next introduced into the tumour, but as the fluid failed to run the opening was enlarged, the child turned on to the side, the contents evacuated, and the tumour easily removed; the pedicle, consisting of the right broad ligament, about two inches long and three-quarters of an inch across, was transfixed and ligatured by carbolised silk. There were no adhesions. Keith's drainage tube was inserted and removed on the third day. The patient made an uninterrupted recovery and left the hospital nineteen days after operation.

The tumour consisted of a single cyst about the size of the foetal head at term; it was full of purulent creamy-looking sebaceous matter and contained several long white hairs growing from its inner surface.

## Reviews and Notices of Books.

*On the Medical and Surgical Uses of Electricity.* By GEORGE M. BEARD, A.M., M.D., and A. D. ROCKWELL, A.M., M.D.

THE eighth edition of this book well sustains the reputation which it has earned as a text-book on a special subject. It appears under the auspices of Dr. Rockwell, who, long since deprived by death of his fellow worker, has spared no pains to give permanency to the effort of their joint lives. The new matter in the present edition is chiefly the result of accumulating experience in the treatment of disease. The earlier chapters, dealing with electro-physics and physiology, are practically unchanged; and they serve as a very useful and fairly sufficient introduction to the study of electro-therapeutics. Dr. Rockwell very justly gives conspicuous prominence to the question of dosage of electricity, and his judicious remarks upon that head will be approved by those who desire to secure for electro-therapeutics a sound scientific position no less than by those who earnestly wish for a secure guidance for its application. There is nothing which more decidedly distinguishes the physician from the charlatan than the aspiration for exact methods and the careful observation of results. According as these objects are attained, there will be less room for the unreasoning credulity which is the prolific parent of abuse, and at the same time a more confident expectation of benefit in those cases where benefit may be obtained. In both ways a larger number of industrious workers will be attracted to a field

which undoubtedly is of much promise. Sharing as we do the author's conviction as to the importance of attending to the minute of treatment, we think it well to quote his words:—"No one who has not had personal experience along this line, or witnessed practical demonstrations of the physiological and therapeutical effects of the various currents of quantity and tension ..... can form any idea of the astonishing difference observed in their action on nerve and muscle;" and we may add that the statement is true in an equal degree of the less understood applications of electricity to other structures. The scope of the present book is very extensive. It is expressly designed "as a work of exhaustive reference for the electrologist," and the latter is defined as one whose ideal it is to become "a master of electricity in its physical and physiological as well as in its purely diagnostic and therapeutic relations." To say that it fulfils this ambitious design would be going too far; but it approaches more nearly to it than does any other text-book. It is especially valuable as embodying the results of a mature experience in a great variety of instances. It is enriched with copious notes of cases. The pathology given for certain diseases is somewhat open to question. As an example, we may note the very unsatisfactory reference to the differential diagnosis of paraplegia. Again, no distinction is made between focal myelitis and general myelitis. We notice also that alcoholic neuritis has no place in the author's scheme. It is mentioned, indeed, under chronic alcoholism, but there is no hint that it is a form of peripheral neuritis and that it is attended with the signs of the reaction of degeneration. In this respect the claim put forth in the preface that the subject matter has been brought up to date is hardly justified, and the omission of due consideration of a disease which is at once so common and which falls so clearly within the province of the electro-therapeutist is an obvious defect. The statement that "the hysterical form of paralysis is constitutional because the entire central nervous system is degenerated into a condition of abnormal sensibility" seems to us to be capable of a good deal of expansion, and in its present form had been better withheld. That "cerebral effusion may be indicated by congestion or infiltration of the optic discs on the side on which the clot exists" is, we believe, at variance with the teaching of eminent authorities. The scheme of pathology adopted in connexion with diabetes is indeed associated with the name of a distinguished physician, but it is certainly not accepted, and the conclusions based upon it appear to us to have little value. Galvanisation of the brain, spinal cord and sympathetic, as an experiment, might possibly prove useful in diabetes, but the expectation of success is not warranted so long as it rests on the belief that those parts contain abnormal cavities during life. "Experimental faradisation of the liver," the alternative suggested, promises quite as well. The reader, after all, will not consult this work when he desires to refresh his pathology, and if we have thought it our duty to point out defects of this kind, we have every wish to give the authors credit for the good work that they have done. This is for the most part of a clinical kind, and it could not have been done better. The book will be found to be truly exhaustive from the point of view of treatment, and under each heading there are the fullest directions for those who will follow them. Dr. Rockwell is well qualified to hold his own opinion as to matters of fact; and it is interesting to read that "there are a number of methods by which the superior, middle, and inferior cervical ganglia of the sympathetic may be demonstrably affected by a galvanic current." The English reader will decide for himself whether the effects of sub-aural galvanisation may or may not with good reason be referred to the sympathetic.

The best parts of the book are perhaps those which refer to general electrification, whether by the bath or in other

<sup>3</sup> *Ibid.*, vol. i. 1884, p. 731

ways. There are here suggested abundant materials for thought and further experiment, and at the same time a large number of facts, which, being well attested, are in the present state of science of great value. Scattered throughout are many practical hints which will be read and remembered with advantage. These are often of general interest, and are the welcome contribution of a well-stored practical mind. We would mention especially a good and simple plan for applying dry heat to a limited surface (page 485). The chief interest of the book is, of course, of a medical kind, but it deals also at considerable length with the surgical applications of electricity. It is well written and well illustrated throughout.

*The Surgical Treatment of Neuralgia of the Fifth Nerve.* By WILLIAM ROSE, M.B., B.S. Lond., F.R.C.S., Joint Professor of Surgery in King's College, London, and Surgeon to King's College Hospital. London: Baillière, Tindall and Cox. 1892.

THIS is a reprint of Mr. Rose's Lettsomian Lectures delivered before the Medical Society of London in January and February last, and published at the time in our columns. The subject dealt with is one of great importance, and Mr. Rose has produced a very interesting and valuable *brochure* on it.

*Ambulance Lectures.* By G. H. DARWIN, F.R.C.P. Edin. Manchester: J. E. Cornish. London: Charles Griffin and Co.

THIS little book, written expressly for the lay student, contains several useful hints and suggestions which cannot fail to be of service to students of ambulance work. The first lecture deals with the Structure and Functions of the Body in a style almost entirely free from technical terms, and the succeeding lectures treat in an equally interesting manner of the subjects dealt with in "first-aid" books. The work is copiously illustrated, a special feature being a diagram with instructions for rendering first aid in cases of fracture in the lower limbs of females—an accident always presenting more or less difficulty to the mind of the ambulance student. Many suggestions are made for the safe transport of the sick and injured; and diagrams, illustrating methods by which stretchers may be improvised from materials likely to be at hand, occupy several pages of the work.

*Archives of Surgery.* By JONATHAN HUTCHINSON, LL.D., F.R.S., Consulting Surgeon to the London Hospital, and late President of the Royal College of Surgeons. Vol. IV., No. 13. London: J. & A. Churchill.

THE interest in Mr. Hutchinson's Archives is fully maintained, and the volume before us contains much valuable and suggestive material. It is difficult to say which is of greater value, the collection of odd facts, rare experiences and doubtful questionings, or the enunciation of general laws and the formulating of rules of practice. No one can study these Archives without profit, and above all without being forced to ask himself questions.

*Diseases of the Nose and Throat.* By T. W. BOSWORTH. Vol. II.: Diseases of the Throat. New York: William Wood and Co. 1892.

THIS volume contains a detailed account of the diseases of the throat and larynx. The anatomy and physiology of the parts concerned are well stated and explained. No pains have been spared by the author to make the work complete. Each subject is enriched by numerous explanatory cases from his own practice and that of others. The labour of compiling the work must have been considerable, but the result has been that some of the chapters form admirable monographs.

This is notably the case in the chapters on growths of the tonsils, palate and pharynx. The author here shows extensive acquaintance with the general literature and practice of surgery. The operative measures are generally well described, and the risks of what are often termed "minor" operations are well estimated. We are pleased to see that an author of this experience speaks forcibly of the risks of hæmorrhage from the ordinary operation for tonsillotomy in the adult. There is perhaps a tendency in this part of the work to advise operations for conditions which may as well be left alone, and which, the author plainly hints, usually give trouble in neurotic and hysterical individuals. He has, however, the good sense to disclaim operations by caustics and cauteries, and to give the preference to those methods which are least likely to lay the surgeon open to the charge, of providing a remedy which is worse than the disease.

The first section, comprising 433 pages, is devoted to affections of the fauces; the second section deals with the anatomy and diseases of the larynx; while the third enters into a full description of the external operations of the throat, such as tracheotomy and pharyngotomy. The chapters of the third section are all excellent, and eminently practical. Seeing that the author has entered into the operation of tracheotomy with such detail, we think he should have given his experiences with regard to the after treatment at greater length. Little is said about those difficult cases which occur in children where, for no obvious reason, it seems impossible to give up the use of the tube, and which are always embarrassing and sometimes fatal. Some excellent coloured illustrations of the operations of tracheotomy and excision of the larynx are to be found in this part of the work. The illustrations generally are well executed, though some of them, as the drawing of lupus of the fauces (Fig. 31), would be difficult to recognise. The volume, which is excellently bound and printed, may be advantageously studied by the general surgeon, for it deals with many matters which must occasionally come under his hands. For a book of reference it is also useful, and to all classes of readers we heartily recommend it.

## New Invention.

### "THE LAURA BED."

A CORRESPONDENT sends us an account of a bed or mattress made in the usual way, but with a slice cut off at one side to admit of the introduction of any vessel under the patient lying on it. When this piece is replaced the mattress is to all intents again complete. It is recommended that blotting-paper sheeting be used around the opening. In the description of the bed the part which can be moved is represented as hinged to the main part of the mattress and as of a square shape. The arrangement is undoubtedly a good one, but the suggestion is not novel.

YORKSHIRE VETERINARY MEDICAL ASSOCIATION.—At Darlington on the 2nd inst. the annual meeting and dinner of the members of the above Society were held, the chair being occupied by Mr. F. R. Stevens, the president, who delivered his inaugural address. In the course of his remarks he expressed the hope that as a result of the Royal Commission on Tuberculous Diseases there would be an alleviation of the evils which affect so injuriously cattle-breeders and the public generally. It was surprising, he said, how large a proportion of young cattle were affected by tuberculosis; and he thought the community in general would be the gainers by the appointment of a competent inspector, at a liberal salary, whose duty it would be to check such practices as favour an extension of diseases of the kind referred to.

# THE LANCET.

LONDON: SATURDAY, SEPTEMBER 10, 1892.

THE measures of protection against cholera which England has now long adopted and which she has from time to time matured and improved have during the past few weeks been put to a somewhat important test, and the result has been one that is eminently satisfactory from the public health point of view. Cholera has been brought to our shores at about a dozen different points; in each case the disease has been limited to those who have arrived from infected places abroad and no spread has taken place. In two respects our measures of defence were found to need strengthening. Our system of keeping people arriving from infected places under some observation for a few days had not sufficiently provided for the event of an immigration of aliens not knowing where to lay their heads; and the circumstance that Hamburg ships replenished their water-supplies from the cholera-polluted Elbe was also a contingency that could hardly have been anticipated. In both these respects the regulations of the Local Government Board have been strengthened; a further Order has just been issued extending the requirement as to giving addresses to those arriving not only in infected ships but from infected places; and we have now breathing space in which to take count of that which has passed and of that which may again be in prospect for us. In one respect there has been misapprehension. It has been assumed by some sanitary authorities that the mere fact of our system of "medical inspection" exhibiting certain interstices through which cholera might creep was sufficient to warrant them in crying out for a return to quarantine restrictions, some wishing that all vessels from infected places should be kept in detention two days, others three and four days, and others five days. As to this demand, we would, in the first place, point out that the English system never laid claim to any infallible pretensions to keep cholera altogether out of the country. It has always been assumed that the disease might, as it were, filter through the meshes of our port sanitary administration, and hence, after this first line of defence, our trust lay in our greatly improved sanitary administration, and in the fact that the means by which cholera can spread in our climate have been so largely removed. In short, the ports were to do their best and the inland districts were to remember that they might have to take up the task.

The alternative of quarantine is one which we can hardly contemplate. Taking France alone and assuming that a few of its north-eastern ports are infected with cholera, the task of imposing quarantine would be simply herculean, even if possible. The thousands who travel weekly between France and England would have to be kept either in harbour or riding out at sea; they would have to be fed and cared for; if cholera appeared amongst them the sick would either have to be landed or left to diffuse the infection

amongst their miserable fellow passengers, under conditions most likely to favour the spread of the disease; and lastly, a system of surreptitious landing of those who could pay to come ashore would rise up all round, be in active working every night, and reduce the whole system to a hollow farce. And yet there are sanitary authorities who, after having administered our Public Health Acts for some five-and-twenty years, and having watched the immense reduction of mortality which has followed on the removal from their midst of those conditions which are essential to the spread of cholera, are now, in a state of panic, desirous of reverting to a system which has only to be applied in order to be found wanting, and which would, more than anything else, tend to discourage sanitary progress in our midst. True, the system might answer to some extent if it were applied to only one or two special ports; but if it were extended to every port, as it must be if applied at all, it could do little short of bringing discredit and obloquy with it.

What, then, is our duty? Clearly, it is to go on working on our well-established principles. The effort made in some of our port districts has been an arduous one; in some it has had to be stimulated by the visits of medical inspectors of the Local Government Board; but, on the whole, the difficulties have been admirably faced and met. We have, however, the future to contemplate. We have all along expressed the opinion that whatever emergency we had to face this autumn it was by no means impossible that we might have a much greater one to cope with next year. This year our ports have not failed in their out-post service. Next year they may possibly be less successful, and hence it is that we would urge all sanitary authorities, and notably our inland authorities, to make preparations to deal efficiently with imported cholera. If they do, they may succeed as well as our ports have succeeded. After all, it is not cholera so much that has to be feared, it is rather the filth which may serve as a breeding-ground for imported infections, whether of cholera or of any other similar disease; and any progress that is made by way of ridding districts of their insanitary conditions during the next six months will tend to lower the general mortality, to reduce the fever mortality, to increase health and vigour, to add to the amount of remunerative labour that is practicable, and so to augment the prosperity of the locality which makes such progress.

There is perhaps no work that more needs to be carried out maturely and without haste than that of providing means of isolation for first cases, whether of cholera or of other spreading disease. Authorities who wait till disease is actually at their doors have again and again put up hurried structures which, instead of meeting the more permanent requirements of their districts, have, on the contrary, served to deter people from using isolation hospitals. Emergency hospitals are only fit for emergencies; the very emergency which it is hoped they will meet often necessitates their being large and costly and yet very inefficient; and a number of them have been finished just too late to be of any service at all. Many sanitary authorities have been urged by their medical officers of health to be prepared in advance with the means of coping with first cases. This is essentially a time in which this advice, if ignored hitherto, should be heeded. There are doubtless many districts in which it would be impracticable to provide in advance,

and for all portions of it, the means of isolating cholera cases. Cholera patients cannot well be removed to a greater distance than a mile at the most; but, on the other hand, a single, small, properly constructed hospital may at any moment save a district from the spread of the disease, it will always be available for diseases other than cholera, and it will serve as an administrative centre whence outlying and temporary isolation arrangements can be carried out. In short, what we wish to impress upon sanitary authorities, whether port, riparian, or inland, is that during the coming winter they should mature and carry out a system of sanitary defence which will enable them to meet cholera if it comes, and which will be of inestimable service to their districts even if, as we earnestly hope, we are spared its visitation.

We are in the mental habit of localising "misery's darkest cavern" in the slums of London. The study of a letter in the *Northern Chronicle* of Inverness by Mr. ROSS, a district medical officer of health in Ross-shire, in answer to correspondents who maintained that the proposal for a Ross-shire hospital for treating and isolating infectious cases was unnecessary and impracticable, may lead us to doubt whether it should not be located in very different regions. He gives us a peep into the problems of misery which the medical officer of a parish in the Highlands or islands of Scotland has to face and solve almost unaided and in physical and hygienic circumstances which would be the despair of ordinary men without the genius of humanity that is so favoured by the pursuit of the medical calling. The lot of a medical officer of the East-end of London, within measurable distance of a State or rate hospital for infectious diseases, or the general hospitals of London, is not to be compared with that of his colleague in such cases as the following, culled out of an experience of many outbreaks of severe infectious disease in one of the eleven districts for which an infectious hospital is proposed. Typhus fever attacks a family of eight—father, mother, and six children, the youngest eight months old. In a few days all are stricken except a girl of ten. The house—a wretched crofter's house—is of the poorest and most uncomfortable description. One patient occupies each of the three beds. The other four lie in their clothes on a little straw on the cold, damp, earthen floor. All necessaries and comforts are wanting. No relative or neighbour can be got to enter the house for love or money, and Mr. ROSS points out that no nurse could be accommodated in such a house or would accept the duty, which, indeed, would almost certainly involve another case of typhus fever and a great addition to the difficulties of the poor medical man. We can only afford room for another illustration of the plight of the poor in these districts and of the unequal duties thrown solely by society and its sanitary authorities on the medical officer. Only two years ago Mr. ROSS had to attend a crofter's wife and her three children suffering from typhus fever. The other inmates of the house were the husband, beginning to sicken, and the mother-in-law. The wife was in the eighth month of pregnancy, and on the eleventh day of the disease labour came on. Mr. ROSS had without assistance to attend her both as doctor and nurse. She was delirious, and lay perfectly helpless, covered with

a blanket on a little straw on the damp earthen floor, and in a chamber reeking with fever emanations. His predecessor, attending a family suffering from typhus fever in a house seven miles from his surgery, one day on his visit found the mother dead and the baby sucking her breast. No one could be got to take charge of this poor waif, and he wrapped it in his coat and took it home in his gig and had it nursed, with the result that his wife, children and servants sickened with the disease. We feel bound to accentuate and publish such tragedies of suffering and abandonment on the one hand, and of medical heroism and duty on the other. In other cases the medical man has had to act not only as professional attendant and as nurse, but as undertaker too. Scotland is a religious country, but it is open to the charge of expending too much energy in ecclesiastical controversy while omitting the weightier matters of the law, of which we would say that immediate provision of hospitals for the infectious sick is one of the most urgent. But it is not only the infectious sick. In one sense they are, perhaps, better off than others. Forsaken by all others, they are visited by the doctor who is supposed to do the work of the Good Samaritan for relatives, churches, and the whole community on a very inadequate pittance at the great risk of his own life. This visit is like that of a veritable angel of mercy. But, unfortunately, his powers are limited, and so are the means of the poor, from which it follows that a large proportion of these, at least in the northern parts of Scotland, die without any medical attendance at all. In his report for 1891, as medical officer of health for Ross and Cromarty, Dr. BRUCE gives some interesting particulars on this subject. In Applecross, of 70 deaths in five years 57 were uncertified—that is to say, 57 of the 70 patients died without medical attendance; in Glenshiel, of 27 deaths 15 were uncertified; in Gairloch, of 304 deaths 200 were uncertified; in Kintail, out of 59 deaths 34 were uncertified; in Kinlochlinchart, of 37 deaths 14 were uncertified; in Killearnan, of 82 deaths more than half were uncertified; in Kincardine, out of 85 deaths 40 were uncertified; in Stornoway, the largest of all the registration districts, with a considerable mortality from phthisis, diphtheria and pneumonia, one-fourth of the whole number of deaths were uncertified. Dr. BRUCE, with characteristic sense, emphasises the seriousness of such facts, and points out that in outlying districts many die who should not. It is easy to be satirical over the limitations of the power of the medical art, but the inhumanity of arrangements which allow people to die without the chance of medical relief is obvious. Little imagination is needed to conceive the unrelieved, but relievable and even removable, suffering which is endured by those who in a religious country, with two or three churches in the smallest parishes, are allowed to die unattended.

We commend such facts to the serious reflection of the Scottish people and of the Secretary for Scotland of a Government which states its intention to grapple with the social problems of the poor. A better house accommodation, consistent with decency and health, a better medical service in remote parts where urgent suffering can at least be mitigated, and a place of refuge and retirement for those attacked with infectious diseases, are measures that would redound to the credit of any party, and for which we shall look the more from a Government that has had the courage

to place a member of the medical profession in responsible relations with the work of local government.

We have not in these remarks said much about the injustice and hardship to medical men of such arrangements, and of expecting them to do the duty of the whole community to sick and dying people. The point is too obvious to need to be laboured. Reasonable risks are a part of the undertaking of any medical man who enters the ranks of the profession, just as the risks of war are undertaken by a soldier; and they are undertaken cheerfully. But the medical practitioner should not be expected to make bricks without straw, and the risks he has to undergo should be mitigated by the provision of every help that can be supplied. His remuneration should be generous, and enable him to go over moors and ferries with despatch, and to supply his mind and his surgery with every book and every appliance that would compensate for the distance of hospitals and libraries. Such men are the very torch-bearers of truth and render help in remote parts and parishes. They need to be multiplied and to be better paid. And such multiplication and better payment are as much the duty of a country bent on advancing civilisation and pure and undefiled religion as the provision of fit hospital and house accommodation.

“Its field is the world” may be said of the healing art more truly than of any other liberal calling. As civilisation expands and covers an ever wider area of the earth’s surface it invites to the most distant regions the accession of visitors from its great centres, who gradually form in those regions the nucleus of a resident population. In this way the English-speaking race may be found planted all the world over, in latitudes high or low, but particularly in that temperate or even subtropical zone which combines with easy access from England herself the climatic mildness and steadiness desiderated in the winter months. This combination is best realised on the shores of the Mediterranean, not only on the seaboard of southern France or northern Italy, the so-called Riviera Ponente and Riviera Levante, but on that of northern Africa from Tangier in the west to Lower Egypt in the east. British residence, in fact, is made possible along the Mediterranean by the admirable means of communication that has been organised in response to annually increasing demand, and few moneyed or leisured people, few even of the busy professional or commercial classes, but find it conducive to health, to longevity, or to more sustained and better work to spend some part of the year at this or that health resort or sun-trap so plentifully sown around the “midland sea.” And when “the winter has past and the spring has come again,” another series of climatic changes is open to a fresh contingent of seekers after rest and air, until summer beckons these in turn from Mediterranean island or Italian lake to Swiss mountain or upland valley, there to enjoy the keenest, most exhilarating and restorative of atmospheres, under a solar warmth that rarely disappoints them. With all this movement of English-speaking population, the services of the duly qualified practitioner are in yearly greater request, insomuch that he can fill up his whole twelvemonth, with hardly an unemployed interval, in ministering to the wants of a steady *clientèle*. In southern Europe especially, there is a permanent staff of British

practitioners at all the chief winter cities, who, after the close of the season, accompany the stream of compatriot travel as it moves northwards from African or Spanish or Italian sun-baths to those sub-Alpine or Swiss resorts to which the changing season attracts it. And an excellent division of the year it is, both for patient and practitioner, that of a late autumn, a winter and an early spring spent, let us say in Rome or Florence, in Naples or Palermo, followed by a late spring, a summer and an early autumn passed in the Alpine uplands or valleys, or in the Black Forest, or in the so-called German Switzerland.

Several conditions are necessary for such a career as is thus opened up to the British medical man—conditions which are neither many nor formidable. In the first place, he must acquaint himself thoroughly with the hygienic character of the place in which he settles. He must not only have made a perfect study of its climate, of its local sanitation, including its water-supply, its drainage, and its dietetic resources, but he must have indoctrinated himself, by association with the consultants native to the locality, in its soundest medical traditions, especially in the etiology, the course and the treatment of the maladies indigenous to the soil. A practitioner in Rome, for instance, would often find himself at an awkward disadvantage if he had not previously familiarised himself with the local malaria, with the best scientific findings as to its nature, its origin, its semeiology, its periodicity, and its response to clinical intervention. To attain this familiarity he must have put himself in friendly relation with his professional brethren, Italian as well as British, who have had the local experience he desiderates, until—in longer or briefer time, according to his vigilance and application—he assimilates the knowledge they possess and so becomes capable of relying on his own judgment and on his own methods. To profit by such neighbourly intercourse in, say, an Italian winter city he must have what is called a “working knowledge” of the language, not difficult to acquire from his previous grounding in Latin and from his usually fair command of French. By this means he is able to meet the native physician or surgeon in consultation, and with mutual advantage to compare impressions or views as to the patient. In these circumstances, moreover, there is much less danger of those misunderstandings so apt to result in the interposition of obstacles to practice—obstacles imposed on the British practitioner by the civic authorities, and occasionally, we believe, at the instance of a jealous colleague with whom a few minutes’ conversation in his own language would have removed any cause of offence. As a rule, however, except perhaps in Switzerland and now and again on the French Riviera, the feeling between the British and the native practitioner is a friendly one, as befits members of a liberal and enlightened calling. In Italy particularly the *entente cordiale* between our compatriot representatives and those of the peninsula is very real, and seldom, indeed, does it occur that any difficulty in the way of practice is imposed by civic authority at the instance of jealous colleagues. Even on such occasions the only trouble to which the British practitioner has been subjected is that of submitting his diploma to municipal inspection in the city where he has settled down.

Some British practitioners in continental countries have taken the laudable course of qualifying at one or other of the

local medical schools, a course which invariably silences any spirit of detraction or jealousy on the part of their foreign *confrères*. Not only for this reason, but for the facilities it affords for scientific coöperation in the study of disease is such graduation to be recommended. Nor need the steps taken with that view be difficult or numerous. Sometimes the presentation of a thesis on a subject of practical or theoretical interest suffices, in conjunction with (duly verified home qualifications, to procure academic recognition from the foreign school. Having received the academic *imprimatur* of the country of his professional adoption the British practitioner has before him a career in many ways to be envied. The public to which he appeals, as the facilities of travel and the comforts of residence steadily improve, is always on the increase. It forms, almost invariably, an agreeable *clientèle* drawn from the well-to-do and presumably the cultured and refined classes. Not only on the French and Italian Riviera, but in the winter cities of the latter country itself these resorts are for three or four months of the year really "suburbs of London"—the English-speaking population of Florence, for instance, in the spring and early summer, averaging from 4000 to 5000. A large proportion of these at the close of April or the first weeks of May is found resident at the Italian lakes or in such Swiss resorts as Lucerne or the lake of Geneva, whither the practitioner, if not in need of absolute rest, may also locate himself; or, later in the season, he may resume active work in such busy hives of holiday seekers as the Engadine or the Austrian or Bavarian Highlands. His success in such a division of the twelve months may well induce others to do likewise; and if competition, in this as in similar fields, divides remuneration, it is also to be remembered that the public for whose wants he caters is equally a multiplying one, and that professional skill and acceptance have their chances abroad as much as at home. One drawback, which used to act as a deterrent to such a career, especially for the scientifically minded practitioner, is rapidly becoming minimised, and that is the lack of the clinical opportunities which our great cities afford. But means of communication come in to obviate this difficulty like so many others; and the British practitioner in the autumn, particularly by those *Pèriencursus* in vogue not only in Austria and Germany but even in the north Italian schools, can keep himself abreast of the latest developments of his art in theory and practice. There is, indeed, no reason why he should not be found in every continental resort of the English-speaking public, or why, as these resorts multiply, he should not, in equal proportion, come to the front. It is a fact that many places, particularly on the Neapolitan and Sicilian Riviera, would even now be rejoicing in an English-speaking colony if only, in addition to the attraction of a good hotel, there were also a duly qualified British practitioner within hail.

An Italian correspondent writes:—"The University of Siena has just witnessed the appointment to the post of Rector of the Cavaliere Professor Domenico Barduzzi, who holds the chair of Dermosyphilopathy. He was in an immense majority over the other candidates. His energy and general accomplishment will, it is expected, soon make themselves felt in the increased prosperity and efficiency of that ancient seat of learning."

## Annotations.

"Ne quid nimis."

### THE INTERNATIONAL MEDICAL CONGRESS OF 1893.

AN Italian correspondent writes: "I am now in a position to give the precise dates of the meeting and rising of this great assembly. After due consultation with representatives of the leading foreign nationalities the Organising Committee has decided that the inauguration of the Congress shall take place in Rome on Sept. 24th, 1893, and that its labours shall conclude on Oct. 1st following. The adhesions received by the committee from all the chief centres of medical education, theoretical and clinical, throughout the world, have surpassed its expectations, while nothing could exceed the cordiality of tone and loyalty of professional feeling with which these adhesions were conveyed. So far as the representation of the healing art in all its ramifications is concerned, it may now be regarded as in every sense complete, and the committee can already look with justifiable satisfaction on at least one page of its preliminary work as closed. The alacrity, indeed, with which the invitations issued to foreign teachers and consultants have been responded to seems to contrast somewhat with the indifference of not a few of the Italian leaders of the profession to the same appeal. 'Before so signal a success abroad,' says the *Opinione*, 'the medical men of Italy cannot and ought not to remain unconcerned. To them belongs the duty of showing by their numerous attendance that they have fully taken in the high scientific and national importance of next year's Congress. It is for this reason that we gladly share the solicitude with which the Organising Committee addresses its Italian colleagues who have not yet sent in their adhesion to the Congress, and with which it appeals to them to intimate their intended participation in its proceedings without delay.' As usual on such occasions, the nearer to the centre of interest the less the enthusiasm shown in it; but it is reasonable to suppose that ere many weeks elapse the Italian contingent, already considerable, will not prove disproportionately short as to the attendance, in point of number and distinction, expected of it. For all who desire further information, or who have yet to intimate their intention to assist at the Congress, I may add that the proper quarter to communicate with is La Secreteria Generale del XI. Congresso Medico-Internazionale, presso la Clinica Medica, Ospedale di Pammatone, Genova."

### THE EVOLUTION OF LANGUAGE.

IF we may be guided by some recently published observations of Professor Garner of Virginia another connecting-link between man and the lower animals is to be traced in the possession by the latter of something like a faculty of articulate speech. Even the chatter of monkeys, if methodically studied, becomes in a degree intelligible—that is, to the human mind. Among these animals themselves it is, according to the observer above named, not only intelligible but understood. He has noticed in their utterances evidence of a purposive character. Signs expressive of address accompany appropriate sounds, and are able to excite responsive actions. Simian speech, in fact, is associated with a form of delivery. It is different for different tribes, and occasionally the language of one is partially acquired by members of another family. The sounds uttered by monkeys in one quarter of the globe, when reproduced by the phonograph, were evidently recognised by animals of the same species in another. Professor Garner, we understand, intends prosecuting still further these interesting studies into what we may call the basis of

articulate speech, and will supplement his observations on captive quadrupeds by inquiries into the gorilla vernacular as it exists in the forest fatherland of the king of apes. His later communications will no doubt be awaited with interest, and may be expected to confirm still further the belief he evidently holds as to the evolution of human speech from an aboriginal, sub-human and rudimentary type. We may be allowed to risk a further suggestion. May not the calls of other animals, the songs of birds, the hissing of reptiles, and the whole and varied catalogue of sounds known in the lower creation be regarded as representing so many stages in the development of language? If Professor Garner's researches, so far as they have gone, indicate anything, it is the probable truth of this assumption.

#### TEA AND TOBACCO IN WORKHOUSES.

THERE is nothing more gratifying to human nature than to have liberty in the use of a valued luxury without either a dread of after consequences or a conscientious prick at heart on the ground of self-indulgence. Happily, we are not without luxuries which can be thus enjoyed, the observance of moderation being always understood. Among them we may number the cup that cheers but not inebriates, and also that much valued solace of tired leisure—tobacco. So familiar to our minds do both appear that many of us would include them rather among the necessaries than the amenities of life. Guided no doubt by such considerations as these the Wandsworth Board of Guardians have introduced a novelty in their system of supply which cannot fail to be warmly appreciated not only by the poor under their charge, but by all who are wisely considerate of the reasonable preferences of appetite. From this time forth every male inmate of their union over sixty years of age will be allowed one ounce of tobacco per week and every woman a daily half-pint of afternoon tea. The tobacco privilege has also been conceded by the parish of St. Olave's, Southwark, and by some other boards of guardians. These kind and inexpensive grants will do something to encourage a belief in the reality of public charity. Given under the above-mentioned conditions they can hardly be accused of exhibiting a pauperising attractiveness. By engendering contentment they will do something to brighten the life, perhaps even to amend the health, of the older workhouse inmates, and we would therefore commend the example of the above-named parishes to others equally open to reason and reform, though not yet so forward in liberality.

#### ALUM IN BAKING POWDER.

ON Aug. 25th at Ilkeston, a grocer was summoned under the Food and Drugs Act on two charges for selling baking powder containing injurious ingredients. From the evidence of Mr. Hehner, the powder in question contained 35.5 per cent. of alum. The alum was used instead of tartaric acid to expel the carbonic acid from bicarbonate of soda. Scientific witnesses, both expert analysts and medical men, were not agreed as to whether the powder would prove injurious when employed to "raise" bread. It was urged for the defence that the chemical process which followed on mixing the powder with the dough rendered it entirely harmless. In the end the summons was dismissed, the magistrates holding that baking powder was not a food and that the powder in question was not sold to the prejudice of the purchaser. This decision is to be regretted. Practically it sanctions the use of alum in a powder which is only used for one purpose—that is, to give porosity and lightness to bread. Bearing this in mind, and not supposing for a moment that baking powder is *per se* a food, it is a moot point whether the powder in question could not be regarded as being sold to the prejudice of the pur-

chaser. It consisted of alum and bicarbonate of soda. These substances when moistened interact, carbonic acid gas escapes and there remains a residuum of sodium sulphate and alumina. Apart from the fact that there is formed by this double decomposition a salt of strong purging qualities—viz., Glauber's salt—it is important to consider what is likely to be the action of the newly formed alumina. It is well known that alumina when precipitated in the presence of certain soluble matters will render them insoluble. This is especially the case with soluble nitrogenous matters. In the chemical treatment of sewage, for example, a large proportion of the soluble nitrogenous matter is removed by adding to the sewage a mixture of sulphate of alumina and an alkali (generally lime). Alumina as a gelatinous precipitate is thus produced, which then, combining with the organic matter in solution as well as that in suspension, subsides as a "sludge" in the precipitating tanks. The same method is adopted for fixing otherwise soluble colours or dyes, the alumina compound formed giving rise to the so-called "lakes." Further than this, alumina combines with soluble phosphates to form insoluble phosphate of aluminium. Surely, in the light of these facts, it is seriously to the prejudice of a purchaser if, when he buys a baking powder, he receives one which is calculated to reduce very materially by reason of the nature of its ingredients the food value of his "staff of life" by rendering both the nutritious and the bone-forming constituents in it insoluble and indigestible. If baking powders must be used, alum should not enter into their composition, especially as there are other comparatively inert and equally effective agents procurable. When a baker uses alum in his bread or flour, proceedings are successfully taken against him under the Food and Drugs Act, and it is reasonable to expect that the same Act should protect the purchaser against alum introduced into his bread in any other form, not excepting that of a baking powder.

#### PUBLIC HEALTH IN SWITZERLAND.

THE "playground of Europe," writes a holiday contributor, "has lately become its sanitary asylum since the outbreak of cholera on the North Sea and Gallo-Batavian coasts has sent the moneyed classes of those regions to the Bernese Oberland. As I write, however, under date the 5th inst., a sensible diminution in this invasion of the panic-stricken has been registered in Switzerland—a diminution largely due to the announcement that in one of the most frequented hotels in Zurich a case of cholera had occurred. But an official inspection of the hotel referred to has dissipated this report, reducing it to the prosaic truth that fumigation, as a disinfecting precaution, had been practised on sundry Germans hailing from Hamburg. No case of death from cholera, no case even of illness from that cause, has been officially recorded in the Confederation. Meanwhile prompt effort has not been wanting on the part of the Swiss authorities to minimise the chance of the introduction of cholera. *L'état général* of the public health has just (5th inst.) been announced by the Bureau Sanitaire Fédéral as 'excellent,' but, all the same, the measures taken by the Bureau for the safeguard of the sanitary position are exhaustive and vigilant. M. Dreyfus, Chef du Bureau d'Emigration, is now in Bâle, armed with full powers to send back across the frontier the emigrant trains arriving by the Chaumont route. Some 250 to 300 passengers by this train were stopped by M. Dreyfus at the frontier; among them the Jews were in a minority, the bulk being composed of Germans, Tyrolese, Italians, and even Americans. On examination, a considerable number had to return whence they came, in some cases leaving their effects behind them; while advertisements, chiefly in the press, gave prominence to the fact that arrivals by emigration trains from Atlantic or North Sea ports

cannot possibly be admitted. The weather in Switzerland, moreover, has been such as greatly to reduce the chances of an invasion of cholera. Since the 3rd inst. wind and rain have been frequent, the temperature has fallen, and, in Italian Switzerland particularly, thunderstorms, followed by snow, have given a distinct freshness to the air. Which means that the subalpine lakes—the Laghi Maggiore, Como and Garda—must attract daily larger numbers of visitors, who, after their *villeggiatura*, will find their way to Venice, Florence, Siena, or Rome, in none of which resorts has there been, or is there likely now to be, the slightest *souppçon* of cholera.”

#### A RESCUE RACE AT BROADSTAIRS.

SEVERAL years ago Dr. B. W. Richardson, during one of his seaside holidays, instituted what he called a “Rescue Race” in connexion with a regatta at Clevedon. Since then one of these trials of skill has been carried out each year as part of some regatta programme. Last Monday week he organised a rescue race at the Broadstairs Regatta with great success, the details being conducted under the able superintendence of Dr. Walter, vice-chairman of the committee. The rescue race is intended to encourage boatmen at seaside places to learn to put out rapidly to sea in cases of accident and to rescue drowning persons who have fallen into the water. A number of floating dummies are thrown out of a boat stationed 440 yards from the shore, and a signal of distress being fired from the boat, the boatmen on the shore rush to their boats, two men in each, row to the scene of danger, pick up the floating bodies (a sack filled with shavings), and return to the shore as rapidly as possible. The first three who land their body get the prizes according to priority. In the present instance the first prize men performed their task within a period of four minutes from starting from the shore to returning to it; the second did it within four minutes and a half; the third within four minutes and thirty-five seconds. The race created the liveliest enthusiasm not only for the skill it called forth, but for the practical usefulness of the effort. A rescue race was also run this year at the regatta at Swanage for the third time.

#### SENSORY SYMPTOMS IN VISCERAL DISEASE.

THE localisation of pain derived from derangement of internal organs is a subject of some interest, but one which has not been much studied in systematic fashion. Dr. James Mackenzie of Burnley has, however, done something to remedy this deficiency in a paper which he contributes to the *Medical Chronicle* (August, 1892), based on the results of several years' careful record of subjective symptoms. He wisely cautions against the reception of vague statements on the patient's part as to previous impressions, and of course excludes from his study of the subject the complaints of neurotic subjects and cases of actual disease of the nervous system. In diagrammatic form he represents the areas over which pain is commonly felt in disease of the heart, of the œsophagus, stomach, liver, intestines, uterus and bladder, and ample confirmation of the correctness of his facts would doubtless be given by most clinical observers. Thus the seat of cardiac pain is represented as extending across the middle of the sternum towards the left arm; that arising from disease of the œsophagus, is localised about the xiphoid; of the stomach, at the epigastrium and towards the left across the lower ribs; of the liver, from a point below the stomach area and extending to the right; of the small intestines, around the umbilicus; of the large intestine and uterus, across the lower abdomen about the level of the iliac spines; and of the bladder, in the hypogastrium. He points out that pains may radiate from these sites, generally in the course of nerve tracts intimately associated with the spinal origin of the nerves supplying the

skin at the seat of the central pain. Another matter of interest is that the tenderness so often associated with the pain is seated not in the affected organ or in the skin itself, but rather in the subcutaneous tissues; and, what is, we believe, a new point, there is often tenderness over the vertebral spines, corresponding to pains in the back associated with visceral disease. These areas of spinal tenderness embrace from the first to the fourth dorsal spines in cases of cardiac pain, from the fourth to the eighth spines in gastric pain, and from the eighth to the eleventh in hepatic pain, the area of uterine and rectal pain being, as is well known, found over the sacrum. Sometimes areas of hyperæsthesia, together with increased activity of cutaneous reflexes, may be defined, and even anæsthetic patches; whilst persistence of the former may be taken as a guide to the persistence of the pain-producing cause. Dr. Mackenzie enters into fuller detail, with illustrative cases, of each of these points, and it may be remarked that as regards the liver and kidney he has not been able to associate pain with any parenchymatous disorder, but only when the ducts are involved, as in gallstone, renal calculus, pyelitis, &c. At the close of the paper he draws attention to a few points arising out of the study of the subject, such as the fact that pains referred anteriorly are mostly of an intermittent character, whilst those felt posteriorly are more constant; that the pain arising from single and unilateral organs is mostly felt across the middle line of the body, and that in every case muscular fibres are involved. He points out that it is not quite clear how the stimulus is transmitted to the cells in the cord connected with the spinal nerves involved. In the case of the diaphragm this is doubtless through the phrenic nerve affecting the origin of the fourth cervical nerve, and hence the shoulder-pain in these cases, but in visceral affections the path must be through the sympathetic connexions with the spinal cord. The pain is not in the viscus itself, but is due to the stimulation of sensory centres in the cord in connexion with the sympathetic branches supplying the organ, whilst the irradiation of the sensory phenomena, like that of the distribution of herpes zoster, follows the area of distribution of sensory filaments proceeding from the stimulated spinal cells.

#### RECREATIVE EVENING CLASSES.

MOST persons who have given any thought to the subject must have felt that a system of school instruction which is virtually terminated at the age of thirteen, cannot pretend to do more than provide for elementary education. During the years of youth which immediately follow much of what was learnt must be forgotten amid the more practical anxieties of learning a trade and of learning how to live by it. During this period also it is even more difficult to find time or opportunity for self-culture outside the round of daily occupation. There is clearly therefore an opening here for further educational organisation, and this has been occupied with no small measure of success during the past few years by the Recreative Evening Schools Association. The name of this body is fairly descriptive of its aims and its constitution, but some particulars of its past history and its prospects, as noted in a recent report of its sixth annual meeting held on the 12th of July last, are interesting nevertheless. The work of the Association consists, as we have indicated, in supplementing the instruction afforded by ordinary board and voluntary schools by studies more advanced and more practical and in using a method less precisely scholastic. It is carried on in the schools above mentioned, in playgrounds and other suitable premises. The course is a full one and comprises, in addition to history and geography, such subjects as needlework, dress-making, cookery, wood-carving, shoemaking, singing, gymnastics, shorthand, bookkeeping, French and a variety of others. The managing committee note that during the past

seven years not only has there been a large increase in the number of evening schools under inspection by Government inspectors, but that the number of pupils on the register has been nearly doubled, while that of attendances and of pupils qualified for examination by attendance in 1891 was more than twice what it was in 1885. In the earlier year the average attendance was 24,233, in the later 51,974. The new movement, therefore, has evidently taken root and is growing, and the committee feel the more encouraged to call upon School Boards and managers, County Councils, and all who take interest in the well-being of the community, to aid them in their useful work. We are pleased to see that pupils contribute somewhat in fees. This is only right. Surely, the enjoyment of such privileges should be recognised and valued no less as a private boon than as a public trust.

#### THE CHAIR OF SURGERY AT GLASGOW UNIVERSITY.

A TESTIMONIAL numerously signed by the physicians and surgeons of Glasgow and throughout the United Kingdom generally has been sent to the Secretary of State for Scotland on behalf of Dr. William Macewen, who is, we understand, to be a candidate for the chair of Surgery in Glasgow University—at present vacant by the lamented death of Sir George Macleod—urging in his favour that he has been a surgeon on the staff of the Glasgow Royal Infirmary for nearly seventeen years, and the manner in which he has devoted his energies to the advancement of scientific surgery during that period. In proof of this they refer to his masterly work on osteotomy, and to the fact that he is the pioneer of brain surgery, which has been the means of relieving a class of maladies hitherto looked upon as intractable. Dr. Macewen also has the honour of being the first surgeon to successfully transplant bone, a case remaining unique in the annals of surgery. The memorialists express their belief that this eminent surgeon's appointment to the vacant chair would secure the approbation of all competent to form an opinion on the matter.

#### MISSED LABOUR IN ANIMALS.

WE referred in our issue of Aug. 27th to a case of "missed labour" occurring in a mare, particulars of which were brought before the members of the Yorkshire Veterinary Medical Association by Mr. Philip Deighton of Riccall. A resolution was passed requesting us to express an opinion on the case, particularly in its relation to human obstetrics. Six years ago the mare was known to be in foal, yet labour never came on from that time to the time of her death, which occurred on June 3rd last, from strangulation of the intestine. During the whole of this time she was under observation, so that the case cannot be explained by assuming that she was delivered of the foal she carried six years ago and that the one found in utero at the time of her death was the result of a subsequent pregnancy. A careful post-mortem examination seems to have been made and the record of it distinctly states that the skeleton of the foal was reached "on opening the uterus," also that the uterus was about the size of "an ordinary iron bucket" and almost of "the shape of a champagne bottle"—that is, of a symmetrical figure. There is no mention of any adventitious cavity communicating with that of the uterus, while it seems clear from the description that the cavity of the uterus was *uniformly* enlarged and to an extent sufficient to entirely contain the skeleton of the foal. Mr. Deighton's account of the case is so precise that there seems to be no reason to doubt its being a genuine example of "missed labour." Formerly the occurrence of "missed labour" in the human female was generally believed in by obstetricians. That is to say, it was accepted as a possibility that a woman might go the full term of pregnancy or there-

abouts, that the foetus might die and then be retained in the cavity of the uterus for a longer or shorter period—perhaps for many years. It is now, however, generally recognised that the large majority of such cases, if not indeed all, are examples of extra-uterine pregnancy. Certain it is that some cases of supposed "missed labour" have, on post-mortem examination, been found to be cases of extra-uterine pregnancy where a communication had been formed between the cavity of the gestation sac and that of the uterus, thus allowing portions of the foetus to be felt during life through the os uteri. Nevertheless, it seems probable that very rarely genuine cases of "missed labour" do occur in women. Lusk cites a case which he regards as conclusive. The probable date of confinement was Oct. 28th, by the middle of November it was known the child was dead, and "there was no further expulsive action." On Dec. 30th the child was removed from the uterine cavity by Cæsarean section. The analogy between labour and abortion would lead us to a similar conclusion. Cases of "missed abortion" are not at all rare—i.e., cases where, after the death of the ovum at, for instance, the third month, it is retained in utero for weeks or months without the uterus seeming to make any effort to expel its contents. Such retention rarely lasts beyond what would have been the full term had the pregnancy been a normal one. Retention of the ovum for an indefinite period, to be measured by years, is not met with. Similarly we shall probably be right in accepting the possibility of the occurrence in women of "missed labour" when the period during which the foetus is retained beyond full term is a relatively short one, as in Lusk's case, just cited. Where the retention of a dead full-term foetus extends over a period of years there would be a very strong presumption that the case was really one of extra-uterine pregnancy.

#### POISONING BY ANTIFEBRIN.

DURING the last influenza epidemic in Sweden a great many cases of poisoning by antifebrin were observed, as people, immediately they were attacked or believed themselves to be attacked, applied to chemists for the purchase of the drug and took it *ad libitum*. All these cases, however, even when somewhat severe symptoms followed any considerable abuse of the remedy, ended in recovery. Dr. W. Warfvinge of Stockholm has published two such cases in *Hyggeia*. The first was that of a man aged thirty-five years, who took two drachms of antifebrin one morning. In five minutes he felt fatigued and experienced a sense of weight in his head, and soon afterwards black and red clouds appeared before his eyes. Then lassitude in the extremities came on and he went to bed and slept for an hour and a quarter, when he was easily aroused by a call. All this time he understood everything, though not very clearly; but when he attempted to rise he felt giddy, staggered for a few steps and then fell down unconscious. When brought to bed again he swore and fought like one drunk, but soon sank into a comatose condition, with closed eyes, well-marked cyanosis, especially of his lips, relaxed muscles, cold hands and feet, decreased temperature, moderate diaphoresis and a lowering of respiration and pulse. These latter improved after hypodermic injections of camphor and ether, but the comatose state continued for sixteen hours. The following day no symptoms remained but frontal headache and cyanosis. The temperature varied from 97.7° to 101.12°. The urine was clear, deep-coloured, and contained much indican, but no blood, albumen or sugar. Some cyanosis could still be observed on the third day, when the urine was violet from traces of indican. The second case, which, like the first, had been treated in the Sabatsberg hospital, was that of a girl of fifteen, who had taken nearly half an ounce of antifebrin with only just

enough water to enable her to swallow it. In a quarter of an hour her whole body became hot and perspiring. Immediately afterwards she complained of vertigo and impairment of sight, and on attempting to rise from her chair she fell to the ground fainting, and remained in an unconscious state for seven hours and a half. After admission to the hospital vomiting came on. Coma was not so deep as in the other case, and she answered when spoken to loudly. Cyanosis was well marked, but disappeared the following day. The pupils were slightly contracted. The temperature varied from 96·8° to normal. The much speedier complete recovery in this case is probably explained by the washing out of the stomach, which was done within an hour after the antifebrin had been swallowed. Some cases recorded by other authors are referred to by Dr. Warfvinge. A patient of Dr. Z. W. Piehl had taken two scruples of antifebrin on two consecutive days as a remedy against the "Russian influenza," and the second dose was almost immediately followed by restlessness, dyspnoea, vertigo, vomiting, lassitude, pallor of face with cyanosis of lips and nails, a small pulse of 120, and extremely cold hands, feet and nose. Consciousness was, however, not lost in this case, and stimulants soon led to recovery. Dr. Albert Pallin observed in two workmen, each of whom had taken two teaspoonfuls of antifebrin in a day, cold sweats, cyanosis, fright, depression and incipient collapse.

#### CONFERENCE OF MEDICAL OFFICERS OF HEALTH.

THE above conference, held in connexion with the annual meeting of the Sanitary Institute, will take place at Portsmouth on Tuesday, the 13th inst. Several of the subjects proposed for discussion are of especial interest in view of the threatened invasion of cholera. Drs. Seaton, Groves, and Blackman will take part in a discussion on Isolation Hospitals. Dr. Swete will read a paper on the Purification of River Water, Mr. D'earth one on Village Sanitation and its Importance to the Public Health, and Dr. Thresh will deal with the subject of Interpretation of Results in Water Analysis. The Compulsory Notification of Phthisis will be discussed, Mr. A. E. Harris reading the introductory paper, and Dr. Newsholme will introduce the subject of Tuberculous Meat. After the meeting the members will visit the Sewage Tanks and Pumping Station at Eastney and the Borough Asylum at Melton. Altogether an interesting programme has been prepared, and it is hoped that the Conference will be largely attended.

#### A NEW CHINESE MEDICAL SCHOOL.

It is a matter for sincere satisfaction within the ranks of the profession when, without prejudice to existing institutions, a new school of medicine arises in answer to the demand of a local need. We who are watching with some anxiety the slow and halting growth of a metropolitan teaching centre can well sympathise with this feeling. We can therefore cordially appreciate the genuine advance which is indicated by the establishment of such a centre, similar in aim if less ambitious, in Hong Kong. This institution has been founded by resident British practitioners and is intended for the instruction of native Chinamen in scientific medicine. Alike in its history as an independent creation and in its purpose, it therefore illustrates the developmental characters of several deservedly reputed European schools. As regards the necessity for its formation there can be no question. Chinese ideas of medicine, as of many other matters, are of the most quaint description. Astrology, demonology and magic are among the classics of the art in that country, and its accredited methods and implements partake, as is well known, of the same unearthly and inefficient character. Into this cavern of mystery science enters like a beam of pure sunlight, and with it health. The professoriate of the new school is to be congratulated on having successfully localised some of

this vital force in the active personality of two intelligent native graduates who, after a course of five years' training, have been accounted worthy to discharge the responsible duties of the duly instructed medical practitioners. After so careful an introduction to duty the professional development of these gentlemen will be noted with some interest. It is the ambition of the new college that its course of instruction should be recognised in this country. The object is no impossible one, and if we do not yet know of reasons sufficient to justify its present attainment, we can at all events recognise in the care bestowed upon these first *alumni* a prognostic indication of success in this particular at no very distant date.

#### PHARMACY AT THE ITALO-AMERICAN EXHIBITION IN GENOA.

EPOCH-MAKING in many ways, the discovery of America by Columbus, now celebrating its fifth centenary, has had an historical effect on therapeutics by the additions to pharmacy introduced from the New World. The great Italo-American "Exposition," organised in connexion with that celebration at Genoa, places this fact in the most interesting light. We speak not only of the quinine-bearing cinchonas and the many recent accessions made to pharmacology by Transatlantic medical science, but of what may be called the "non-official pharmacopœia of America." Under the section of "Erbe Medicamentose" (medical herbs), there is a most instructive assortment, from Honduras especially, of the remedies drawn from the vegetable kingdom for surgical as well as medical uses—herbs not unknown to European science, thanks to the zeal of the missionary fathers who brought civilisation into that region. Among these may be mentioned a liquid balsam employed, not without success, by the natives in the earlier stages of phthisis; other vegetable products of acknowledged value as emetics, as remedies in cholera, as emollient and strengthening lotions in the treatment of fractures. Pharmacology, ever on the watch for new weapons wherewith to enrich its armoury, will await with curiosity and interest the expert report now in preparation on these and other specimens of the "indigenous drugs" of the New World.

#### CHOLERA AND CREMATION.

IN *The Times* on Monday there appeared a letter from Sir Spencer Wells quoting the following paragraph from its issue of the 3rd inst.: "The German medical papers are beginning to agitate strongly in favour of compulsory cremation where cholera has been the cause of death." Sir Spencer Wells proceeds to observe that "the destruction of the bacilli found in the bodies of cholera patients has long been regarded by most bacteriologists as one of the most necessary measures to prevent the spread of the disease; and there can be no doubt that fire is the swiftest and most effective mode of destroying the bacilli." This is all very true, and, assuming that cremation were limited to the victims of epidemic diseases, whether cholera, scarlet fever, typhus fever, or diphtheria, the great objection to cremation—i.e., the medico-legal one—so frequently urged in these columns would be removed. But we think that exception must be taken to the following sentence: "If they (the bacilli) are buried in the earth they are almost certain to multiply and sooner or later to pollute the earth, the water and the air, and so act as storehouses of disease which ought to be stamped out." There are throughout the length and breadth of this country numerous burial grounds containing the bodies of thousands of victims of past cholera epidemics. Are there any grounds for believing that these are storehouses of disease and that the adjoining houses are unhealthy? The point is one which admits of positive proof or denial. Sir Spencer Wells, feeling very strongly on this point, wrote to Sir Walter Foster, the Parliamentary Secretary of

the Local Government Board, to inquire how the usual regulations as to burial are modified when those who are buried have died of cholera, and whether the cremation of such bodies had been considered by the Board. In reply, he was informed that the Board had not considered the question, but he expresses a hope that the attention given to the matter in Germany will have its effect here, and that it will receive full and favourable consideration from the Local Government Board.

#### SMALL-POX IN AUSTRALIA.

WE learn from the *Sydney Mail* of June 25th that consternation amounting to panic has been caused in Melbourne and Sydney by the landing of passengers at these places from the ss. *Oroya*, of the Orient Line, who afterwards developed small-pox. The ship touched at Albany and Adelaide, was granted pratique at both, and then went on to Melbourne, where a passenger was landed in an advanced stage of the disease. On proceeding to Sydney other suspicious cases were landed. Every effort has been made by the authorities to trace the passengers who landed at the respective ports and to secure their revaccination. But in a continent like Australia, where compulsory vaccination is unknown (and, it is said, would be resisted), the prospect of a widespread and serious epidemic is not at all improbable.

#### THE FUNCTIONS OF VISITING AND RESIDENT STAFFS: THE BRISBANE HOSPITAL.

THERE has been some friction between the visiting and the resident staffs of the Brisbane Hospital. It appears that in 1883 a change was made in the by-laws which took the chief responsibility for the treatment of patients out of the hands of the visiting staff and placed it in the hands of the resident medical superintendent. At a meeting convened for the purpose of considering the action of this rule and its bearing on the respective duties of the visiting and the resident—the honorary and the paid—officers, Dr. Little, one of the honorary staff, complained that he was often left uninformed of important facts in the condition of patients after serious operations, that in his rounds of the hospital he was not always accompanied by one of the resident staff, and he moved that the committee should return to the by-law of 1883. Various views were expressed. Dr. Little was supported by one of his honorary colleagues. On the other side it was hinted that the visiting staff were not always regular in their attendance. In the result it was resolved that the committee of the hospital enjoyed the confidence of the subscribers and that no further action was necessary. The question is one which seems to us to require more definite settlement, otherwise the patient may fall between two stools. Unquestionably the public consider the visiting officer responsible for the treatment of patients, and that the resident officer acts, except in emergencies, under his supervision.

#### A BRITISH HOSPITAL FOR HYDROPHOBIA.

IT is indeed remarkable, we might even say disgraceful, that after the Pasteur treatment of hydrophobia has for years been in successful operation, and in face of the still recent prevalence of canine rabies in this country, we do not possess among ourselves the means of treating this dreaded malady promptly and effectually by preventive inoculation. There are at least three possible explanations which account for this evident omission. One is to be found in the fact that rabies, though not a rare, is not a common disease, nor is it at any time generally prevalent. Then, again, its period of incubation is relatively long. Consequently there has been an absence of any general panic during its visitations, and a large proportion of its victims have been able to avail themselves of the treatment afforded at the Institute in Paris.

Probably, too, the attraction of a great name has not been without its influence in drawing them thither. Yet another cause must also be noted in accounting for our national deficiency in this particular. This is the feeling against vivisection which is still maintained in many quarters. Surely no greater anomaly wears the aspect of true sentiment than this unreasoning antipathy which, in order to spare the sufferings of a few rodents, would permit a human being to live and die in agony within reach of the only remedy proved capable, and amply capable, of relieving him. By some singular twist of logic it has been suggested that members of our own profession are in some way to be blamed for the non-establishment of a British institution for the treatment of rabies. We will not stop to discuss this absurd accusation. We are well assured that when the public mind is opened to the arguments of reason on this subject the voice of medical opinion will greet it with no uncertain sound. There can be no question that a British institute like that in Paris would prove most useful in emergency. It need not be large or costly, and, what is important, it would prevent injurious delay in treatment.

#### POST-GRADUATE CLASS AND LECTURES.

AT Charing-cross Hospital special series of clinical lectures and practical demonstrations, exclusively arranged for the convenience of practitioners and post-graduate students, are given at the hospital by members of the staff throughout the year. The lectures for the year are arranged in three courses, each course consisting of ten meetings and lasting ten weeks. Two of these courses are held during the winter and one during the summer. The class meets on each Thursday afternoon at 4 p.m. in the Board-room of the hospital and proceeds thence to the ward or other department in which the demonstration may be held. The fee at present charged for each course of ten lectures is one guinea. The first of the two winter courses of the ensuing academical year will commence on Oct. 13th next and will be conducted by the following members of the medical and surgical staff: Drs. Green, Bruce, Willcocks, Murray, Mott, Routh, Arkle and Messrs. Bloxam, Boyd, Waterhouse. Practitioners wishing to join the class can receive any further information as to the dates and subjects by communicating with the honorary secretary (Dr. Willcocks) or the honorary treasurer (Mr. Boyd) at the hospital.

#### THE SECOND INTERNATIONAL CONGRESS OF PHYSIOLOGISTS.

THE Second Triennial International Congress of Physiologists has this year held its sittings at Liège, with Professor Holmgren (Upsala) as President, in the Physiological Institute of the University. The Congress terminated on Thursday, Sept. 1st, after a banquet at which the Burgomaster of the city was present. More than 100 European physiologists attended the Congress; of these twenty-four represented Great Britain and Ireland, the number of British members being larger than at the Congress at Basle four years ago. Professor Michael Foster and Professor Burdon Sanderson were present. The following British members made communications, illustrated for the most part by experimental demonstrations:—On the first day: Professor Halliburton (London) on Nucleo-albumins; Dr. Starling (London) on the Fate of Peptone in Blood and Lymph; Professor Sherrington (London) on the Action of Antagonistic Muscles under Reflex and Cortical Excitation (demonstration). On the second day: Professor Schäfer (London) on some further Experiments on the Frontal Lobes; Dr. Noel Paton (Edinburgh) on Crystalline Globulin from Urine (demonstration); Professor Sherrington on Varieties of Leucocytes (with demonstration); Professor Schäfer on Structure of Striated Muscle (with demonstration); Professor Sherring-

ton on Cortical Centres for Movements of the Anus and Vagina (demonstration). On the third day: Professor Gotch (Liverpool) on Temperature and Excitability (with demonstration); Dr. Bayliss (London) on the Depressor Nerve; Professor Burdon Sanderson and Mr. Burch (Oxford) on the Capillary Electrometer and Observations on Muscular Contraction; Dr. Waller (London), Myothermal Observations upon Man (with demonstration). It was agreed to hold the next Congress in 1895 at Berne, in the Physiological Institute of the University, under Professor Hugo Kronecker. The general secretaries chosen for the next Congress are—for the French language, Professor Arloing; for the German language, Professor Exner; for the English language, Professor Sherrington.

#### FEVER IN LONDON.

It is somewhat disturbing to learn that the scarlet fever prevalence in London shows no sign of abatement, and that the admissions have begun to exceed the discharges from the hospitals. The result of this is that the hospitals are full, and already we hear of cases being treated at their own homes. In the meantime the preparation of the new hospital at Tottenham is being pressed forward. We trust that the Asylums Board may be enabled to open this as quickly as possible in order to prevent the home treatment of scarlet fever.

#### SICKNESS AND MORTALITY OF ROSS AND CROMARTY.

DR. BRUCE, in his report for 1891, endeavours to give an idea of the diseases of this district. Taking the sickness from the records of his own private practice for the three years 1870, 1871 and 1872, and again for the three years 1883, 1884 and 1885, he had the following number of cases: Consumption, 30; whooping-cough, 30; epidemic pneumonia, 30; typhoid fever, 23; diphtheria, 14; and rheumatic fever, 6. In the first three years he had three cases of cancer, in the latter three years ten cases. In the earlier period no scarlet fever, in the latter twelve cases. Owing to the large proportion of uncertified cases the death returns are very incomplete, as we elsewhere remark, but we may give the chief factors in the order of fatality, if only to enhance the reflections we make in another column. Consumption causes a mortality of 1.68 per 1000 living; the deaths from diphtheria or croup, a "terrible record," are 131, or 0.543 per 1000; measles causes 73 deaths, equal to 0.300 per 1000 living; cancer 67, equal to 0.284 per 1000; diarrhoea 61, equal to a rate of 0.258; typhoid fever 19, equal to 0.080 per 1000; scarlet fever 14, equal to 0.059; puerperal fever 13, equal to 0.055; tetanus 11, equal to 0.047. We assume that these "tetanic" cases are mostly infantile, of the nature of trismus neonatorum, and if so they are not the least significant indication of the insanitary condition of dwellings and of the preventableness of the mortality in these parts.

#### INTERNATIONAL DERMATOLOGICAL CONGRESS.

THE foreign and Austrian members of this Congress met on the 6th inst. at a social gathering at the Kaiserhoff, when it appeared that in spite of the outbreak of the cholera epidemic the attendance of members of the Congress from foreign countries will be a good one, though the arrival of many French, English, American and German members was delayed by the quarantine measures of the continental states. The Congress was opened on Wednesday at the University Hall by Professor Kaposi, who addressed the meeting in the German, French and English languages, in presence of the officials delegated by the Austrian Ministers and the City of Vienna. Professor Hardy of Paris, having been elected president, gave an address which he styled "Coup d'œil sur l'État Actuel de la Dermatologie." He gave a sketch of the development of modern dermatology from

the time of the school of the St. Louis Hospital, where Mayer, Cazenove, Gibert and Vergeric laid the first foundation of scientific dermatology. He then pointed out the great merit due to Erasmus Wilson and Hebra, who inaugurated the anatomical study of skin diseases and he explained finally the importance of bacteriology and of modern neurology in the development of dermatology. The first subject of discussion was leprosy, but as Dr. Petersen of St. Petersburg and Dr. Arning of Hamburg were absent on account of the outbreak of the cholera in their respective countries, the thesis prepared by Dr. Arning was read by the general secretary.

#### THE GENERAL MEDICAL COUNCIL.

WE have been informed that the name of ex-Professor John Struthers has been mentioned in Scotland as a fitting successor to the late Sir George Macleod in the General Medical Council. Dr. Struthers resigned his seat for the University of Aberdeen, much to the regret of most of his fellow-councillors, who appreciated the good work he had done on the Education Committee; and although he had not, and as we are informed has not, any intention of becoming a candidate, yet we understand that he would accept the Crown nomination if offered to him.

#### TYPHOID FEVER AND ICE CREAM.

DR. GEORGE TURNER is said to have informed the London County Council that he has traced an outbreak of enteric fever to the distribution of infected ice cream by Italian street vendors living at Deptford. The Council has properly urged on the local sanitary authorities attention to this possible source of danger.

#### ERGOTISM AND EYE AFFECTIONS.

DR. KORTNEFF relates in the Russian *Ophthalmic Review* some results of an epidemic of ergotism which recently raged in the Viatka Government, affecting 2000 persons. This was due to diseased rye having been employed in the making of bread. About two months after the commencement of the epidemic a good many patients came to the dispensary, complaining of trouble with their eyes. Some of them had temporary attacks in which vision was diminished to  $\frac{1}{5}$ , or even less, the fundi being very pale; and simultaneously with the eye trouble there was trembling of the limbs. Others complained of persistent impairment of vision, and these were found to have cataract which could not be distinguished from ordinary senile cataract. Maturation took place in from three to twelve months and was especially rapid in the case of children, some of whom were only six years of age.

#### THE EXTENT TO WHICH THE TOXICITY OF PHOSPHORUS IS AFFECTED BY TURPENTINE.

THE utility of turpentine in cases of phosphorus poisoning has been submitted to a very thorough investigation by Dr. Bush of Dorpat, who employed cats, dogs, a rabbit and a cock for his experiments. The phosphorus was administered in amounts larger than the minimum lethal doses, either hypodermically or in the form of emulsion by the mouth; and an hour or an hour and a half subsequently an emulsion of turpentine was given. The results showed that turpentine has the power of hindering to a certain extent the toxic action of the phosphorus. In addition to the use of turpentine in cases of acute phosphorus poisoning Dr. Bush advises that emetics should be given and that the stomach should be washed out. He estimates that doses exceeding the lethal dose by 0.001 grm. per kilogramme of body weight may be rendered non-fatal by means of turpentine. The explanation of its action is that it forms a compound analogous to the terebinthino-phosphoric acid described by Koehler and by himself, this body being less toxic than the phosphorus contained in it.

## FOREIGN UNIVERSITY INTELLIGENCE.

*Buda-Pesth.*—Dr. E. Reczey has been promoted to an ordinary professorship of Surgery.

*Cracow.*—Dr. K. von Kostanecki has been appointed to the chair of Comparative Anatomy.

*Gratz.*—Dr. Carl Freiherr von Rokitsansky has been appointed to the chair of Midwifery and Gynæcology.—Dr. Ernest Borner, who has for a considerable period discharged the duties of the professorship, has received an acknowledgment of his services in the form of a knighthood of the Order of Francis Joseph.

## DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Professor Ludwig Bandl, the well-known Vienna gynæcologist, at the age of forty-nine.—Dr. Otto von Steinau-Steinrück, formerly a well-known and much-respected Berlin practitioner, at the age of seventy-six.—Dr. Alexander Obermüller, a distinguished Russian surgeon, who was associated with Professor Pirogoff in Sebastopol during the Crimean War, and who did important service in organising the medical department of the Russian army during the Russo-Turkish War.—Dr. Porai-Koshitz, *privat-docent* in Syphilography in the University of Kharkoff.

ITALY, at the commencement of the tourist season, wisely sends to the frontier of the Alta Italia the Commendatore Pagliani, Director-General of State Hygiene, commissioned to reorganise the sanitary surveillance, now rendered doubly necessary by the influx of strangers, particularly from the North Sea ports. The use and incidence of disinfectants are among the provisions of which he is to take special cognisance, so as to observe a just means between vexatious restrictions on the one hand and perfunctory operations on the other.

THE death, on the 5th inst., of John Edward Morgan, M.D. Oxon, F.R.C.P. Lond., is announced. The deceased physician was brother of Sir G. Osborne Morgan, Judge Advocate-General in Mr. Gladstone's late Administration. Dr. Morgan was a voluminous author, whose works for the most part are destined to survive.

WE have to announce with regret the death on the 2nd inst. of Mr. Walter Pye, F.R.C.S., Eng., Lecturer on the Practice of Surgery at St. Mary's Hospital, and late Professor of Pathology and Surgery at the Royal College of Surgeons. Mr. Pye held several hospital appointments, and was the author of many valuable works on surgery.

AN Italian correspondent writes: "By Royal mandate Dr. Guido Baccelli has been charged to represent His Majesty the King of Italy at the inauguration of the International Medical Congress which opens on Sept. 24th, 1893, in Rome."

THE introductory address of the winter session in the Faculty of Medicine in Owens College, Manchester, will be given on Monday, Oct. 3rd, in the Chemistry Lecture Theatre of the College, by Dr. W. H. Broadbent, F.R.C.P.

THE inhabitants of Monkwearmouth are up in arms against the proposition to erect a wooden building in Sunderland, to be used as a cholera hospital in case of necessity. The contention is that the hospital should be a floating one.

## CHOLERA.

## PROGRESS OF THE CHOLERA.

IT is satisfactory to learn that cholera shows symptoms of distinct decline in what may be regarded as its European home—namely, Russia—and at Hamburg, from which point it menaces both the Continent and the British Isles. But there is still room for discouragement in the fact that the disease has appeared at Riga and in the suburbs of Hamburg. It is gratifying to know, on Professor Virchow's high authority, that strenuous means are being taken in Russia to combat the malady, and that the hospitals provided are excellent in every way. Satisfaction will be felt, too, in considering that cholera has acquired no foothold in Berlin or the interior of the German Empire, and that there has been no southward march of the disease to the Austrian Empire or to the Black Sea or Turkish ports. The enemy has, indeed, followed a western route on this occasion as in previous epidemics. So far Hamburg has been the only threatening point as regards this country, although it appeared at one time as if Havre and Antwerp would constitute real dangers to us. These latter fears have now apparently proved groundless. But there is cause for uneasiness in the recent news to hand that cholera is sensibly present, though not as yet in epidemic form, at Rotterdam, which, like Hamburg, is one of the classic places from which the disease has been imported into this country.

It is gratifying to see not only that public opinion has been aroused with regard to the danger which threatens us, but that the local authorities of the country, particularly those of port and riparian districts, are taking every precaution to keep out the disease and to deal with it if it unfortunately enters our land. This is being energetically done with the active advice and assistance of the Local Government Board medical staff. So far, the results as to prevention have been satisfactory. Though there have been importations from Hamburg into the Thames and the Tyne, and at Grimsby, there has been no spread amongst the land population contiguous to these respective ports. Indeed, the arrangements for dealing with the pestilence that threatened London as well as the north and north-east of the country have been most admirably planned and carried out. Londoners in particular owe a deep debt of gratitude to the port authority and to the efforts of Dr. Collingridge, their health officer. No doubt this country is in a better condition now to resist cholera than it was in the great epidemics of 1849 and 1854, or even during the more localised outbreak of 1866; and were the disease to burst through the first line of defence—viz., the ports—it would not reach the terrible proportions of former days. But it will be universally confessed that we still have many weak points and "plague spots" amongst us in which cholera would thrive abundantly. So that the second line of defence—namely, improvement in sanitary matters—should be got ready without loss of time. It is to be sincerely hoped that the third line of defence—viz., hospital provision and isolation—will not be necessary. Nevertheless, it is well to know that in London the Asylums Board and local bodies are maturing a system of ambulance transit and hospital accommodation, whilst sanitary authorities in the provinces are doing their best in the same direction. At present all efforts are concentrated on the points of entrance of cholera. Our English system of medical inspection, as opposed to quarantine, so amply vindicated before, is now again in the furnace of experience. A striking contrast is to be observed at New York, where, in consequence of outbreaks of cholera on the *Italia* from Havre and the *Normannia* from Hamburg, a general European quarantine is in force. This contrast will doubtless afford a means of comparison of the efficiency of the two systems. There is no fear that our own will not stand the test. In the meantime, as a correspondent of *The Times* of Sept. 5th wisely says, there should be no undue alarm amongst the public at the present crisis; for, in the first place, no epidemic exists at all, and even if an epidemic such as we have previously had were to take place, it would, on an average computation, be thirty-five times less severe than an ordinary outbreak in the native home of Asiatic cholera.

CHOLERA: WHAT WE KNOW ABOUT IT AND WHAT WE STILL REQUIRE TO KNOW.

We said last week that the study of cholera as a branch of epidemiology is one thing and the study of the causes of its progress in relation to communities and its propagation among the series of units of which such communities are composed is another, and that different conclusions would probably be reached according to the standpoint from which the observations are made. Considering what may without exaggeration be characterised as the flood of cholera literature which has recently appeared in the shape of leading articles, correspondence and paragraphs descriptive of the course and progress of the epidemic and its real or alleged causes, or proffering advice and suggestions in regard to the prevention or mitigation of that disease, it is somewhat singular that some points connected with its recent history have not been more forcibly dwelt upon. To begin with, there is not one—there are two epidemics. One of the most curious and interesting features connected with the medical history of Europe at the present time consists in the fact that we have, in reality, to deal with two epidemics of cholera which, so far as our present knowledge stands, have been or are independent of one another. They have started from different centres and pursued different courses, and that which was nearest to us in Europe apparently anteceded the appearance of the other and larger one on Russian territory. The starting-point of the latter has been traced back to the great Hurdwar fair in India. It will be remembered that the cholera broke out there on March 22nd, and that the fair in consequence was closed on the 25th of that month and the vast assembly of pilgrims dispersed. Thence the disease may be traced by way of Afghanistan and Herat, at which places it prevailed in April, into Russian territory and along the Caspian to Baku and Tiflis, with a cross branch from its left flank towards Batum and the Black Sea, and onwards by the Volga until it reached St. Petersburg, and going south-westward, ultimately Hamburg. On the other hand, the other epidemic commenced as a limited but very sudden and fatal outbreak in an overcrowded prison at Nanterre, close to the Seine, early in April last, and the disease having prevailed in the suburbs of Paris, especially in the neighbourhood included, as it were, in the loop of that river, subsequently reached Rouen and Havre. It likewise prevailed at Antwerp, which may possibly be topographically regarded as the point of confluence or convergence of the two epidemics. The exact nature of this epidemic disease near Paris at the date of its inception in the outbreak at Nanterre in April was a matter of contention at the time. It was strenuously denied that it was Asiatic cholera at all, but rather some pseudonymous congener which closely mimicked that disease, but was dependent on strictly local causes—viz., the use of the Seine water—and clearly had no relation to the cholera epidemic invading Russia at her eastern frontier. The next point to be remarked is that attention has been concentrated on the Russian epidemic almost to the exclusion of the other, and that by vessels from Hamburg and by Jewish and other immigrants from Russia the disease has been introduced into this country in numerous directions, but in no instance has it happily taken root in our soil; or rather it would be safer to say that up to the present time it has not manifested its presence among us by any epidemic or more circumscribed outbreak of any kind. It may be pertinent and interesting to advert here, in connexion with the date of the earliest cholera manifestation in the vicinity of Paris, to a somewhat significant parallel fact connected with the way in which cholera comports itself in India. When cholera overflows, as it were, the margins of its endemic area in that country, either sporadic cases of so-called spring cholera or sudden and very circumscribed outbreaks of that disease are frequently the earliest premonitory manifestations of an increased activity on a far wider scale later on. Be this as it may, the disease, although introduced, as we have said, at so many points in this country, has not taken root and developed, and that this is so has been quite reasonably attributed to our improved sanitation and good water-supply having afforded it no suitable soil, to the vigilant care that has been exercised in regard to shipping and immigration, and to the advent of colder weather and its well-known repressant effect on epidemic

cholera. Many thoughtful observers had ventured to prophesy from the first, however, that it was not this but next year that should be regarded as our probable time of danger and trial. Cholera in its epidemic and invading form extends through a succession of years, the period from its first invasion to its final decay and death representing, as it were, its normal life history. Any differences in the parallels between different epidemics probably depend upon meteorological conditions of the area invaded. An epidemic of cholera has a life of three or from three to four years from its start to finish, the interval between one epidemic and the next being uncertain.

The practical lesson to be learnt is that we should make every use of the present interval for improving and perfecting our sanitary condition, and for devising the means of limiting the spread of the disease and of providing for such cases as may unhappily occur. It may sound like a platitude to repeat the elementary truth that it is too late to undertake the removal of accumulations of dirt and the cleansing of sewers when cholera is actually present. The attempt at such a time would only make matters worse, and the unpreparedness of Hamburg to meet the requirements of an epidemic has been an object lesson for us in this and other respects. It is not only useless, but positively reprehensible to dogmatise about a disease like cholera as if we knew all the laws of its epidemicity; but we trust that a really scientific and systematic attempt will be made to chronicle and record a trustworthy history of the origin, course and progress of the present pandemic, and that a similar attempt will be made on the part of every local observer to trace out and follow the progressive steps of the disease in a more limited sphere and amid a sparsely distributed population. The one inquiry is obviously the necessary supplement and complement of the other. The subject should certainly be lifted out of the rut of barren hypotheses and empirical experience and placed upon the firmer basis of ascertained fact, which is the only real road to scientific progress. That persons coming from an affected locality may carry the disease with them wherever they go and die of it are indisputable facts. But more definite information is still required to carry conviction to the minds of some persons as to the influence of such individuals in lighting up or causing an outbreak or epidemic of cholera in the population into which, or through which, they pass. Do they give rise to cholera in every direction in which they may happen to go, or only in certain definite directions? And the cause of the exemption of numerous places within an affected area during the progress of an epidemic through it might also prove a fruitful source of inquiry. We already know enough, however, to be sure that cholera obeys certain laws, and the knowledge is capable of wide and practical application. Whether we regard its natural habitats as India and Asia, of which it is an indigenous product, while here it is of the nature of an exotic, whether its cause be the comma bacillus or some other vitalised agent, whether it be disseminated by human agency exclusively or not, and whether it be earth-borne or water-borne, there can nevertheless be no doubt that dirt is its soil and heat and moisture the conditions for its growth and development—in brief, that the seeds of the disease, like the seeds of a cucumber, need a muck heap for their growth, and with reasonable care and due attention to sanitation we should be able to guard against any such contingency. It may sound like a paradox to say that the best way to isolate cholera infected persons is to disperse them, but the apparent paradox has been found to prove a reality in practice. In India the method pursued is not to establish land quarantine cordons, but the reverse. On the appearance of cholera the troops are dispersed and encamped on carefully selected sites away from the locality where the disease prevails; and, if necessary, the camps are shifted again and again until the disease disappears. This practice has been followed by very marked success, and the camping grounds have not been found by experience to act as foci for the further dissemination of the disease. Why should not some attempt be made in this country to organise some similar method of dealing with cholera should it unhappily become our fate to be subsequently added to the list of countries affected by the present epidemic? Quarantine and sanitary cordons by which all persons, whether affected or simply suspects coming from any place or country officially regarded as infected, were considered to be lepers and crowded together in quarantine quarters without conveniences or comforts of any kind, are things of the past. This system, which inflicted unnecessary hardship, created panic,

stopped all commerce and proper food-supply, and gave rise to evils worse than the risk of contracting the disease, was in reality admirably designed in practice to provide so many nurseries and depôts for the development and subsequent distribution of the disease to other places; whereas the present system of the separation and detention of the sick, and the temporary detention and subsequent observation of the infected or suspected, is to our minds a logical and reasonable method of procedure.

#### CHOLERA IN BELGIUM.—JUMET.

In continuing his letter on the sanitation of Jumet, our Special Correspondent writes:—Considering the severe outbreak of cholera which occurred at Argenteuil, at St. Denis, at Aubervilliers, and, in fact, throughout the whole of the north and western suburbs of Paris, persons flying from these districts should have been carefully watched. The French Government might in some way, either officially or in some indirect and unofficial manner, have warned the Belgian Government that a number of Belgian subjects were going back to their respective homes from a cholera district. Severe measures are now taken to secure the registration of all foreigners residing in France. It would be making good use of the information thus secured to inform foreign governments when a considerable number of their subjects were returning homewards in consequence of an epidemic. My visit to the Town Hall at Jumet did not tend to inspire me with much confidence in the energy and capacity of the authorities. I there ascertained that nothing had been done till after the death of Van Esbercq. At the Town Hall I was assured that the middens were well built, well cemented and water-tight, not that any public functionary watched over this work and verified its soundness, but simply because the masons and bricklayers in the neighbourhood were in the habit of doing their work well. While far from wishing to place any doubt upon the excellence of this workmanship, I cannot but feel that this is an insufficient guarantee. Then we must reckon with the movements of the soil, which are very considerable in those portions of the commune of Jumet where mining operations are carried out. This, of course, must dislocate the masonry, however soundly built, and cause the middens to leak. As wells and middens are side by side, the danger resulting is obvious. At Jumet, in at least three-fourths of the houses, well water or rain water is drunk. Considering the hilly nature of the country, the landslips that have occurred, the fact that it often happens that the basement of one cottage is on a level with the roof of another cottage which is but a few yards distant, and that these cottages have wells and middens overhanging and overlapping each other, the danger of drinking well water becomes more and more obvious. The few cases of cholera that have occurred at Jumet, Roux and the neighbourhood are alarming, only in so far as they may be looked upon as warnings of what may ensue.

#### SPREAD OF THE EPIDEMIC AT ANTWERP.

There is no disguising the fact that the position of affairs at Antwerp is very serious. At first the cases of cholera were distinctly connected with the two ships, the *St. Paul* from Havre and the *Nerissen* from Hamburg. As already stated, the *St. Paul* arrived in the Kettendyck Dock on Aug. 15th; one of the crew fell ill on the 16th, two more on the 17th, and a fourth on the 20th. Three out of the four died, and there were only five able-bodied seamen on board the *St. Paul*. The crew consisted in all of eighteen persons. Then there was a sailor from the *St. Marc*, anchored close to the *St. Paul*, who contracted the cholera. The master of the barge *Souvo Adèle* and his wife and children were the next victims. I have now ascertained that they had washed some of the clothes of the sailors of the *St. Paul*. After that some dock labourers, who had helped to unload the *St. Paul* and the *St. Marc*, fell ill. At the same time the *Nerissen* arrived from Hamburg, and one of the crew, Frederic Maas, died of cholera at the Antwerp Hospital. A woman who kept a restaurant frequented by these sailors was ill in her turn; and in all there were ten cases clearly traced either to the *Nerissen* or the *St. Paul*. The ten cases ended fatally. While the epidemic was limited to the contaminated ships and those who had direct connexion with the ships, there was reason to hope that the evil might be nipped in the bud. Now, however, the cholera has spread not merely among persons immediately connected with the shipping but all over the town. As yet there have been only twenty-four deaths, reckoning from Aug. 16th to Sept. 4th, and some

eighty-five known cases. It is probable that several other cases have not been reported, or have been diagnosed as choleric instead of cholera; but the fact that the more recent cases appear disconnected one from the other and are scattered in various parts of the town seems to indicate that the infection has now become general. In the face of this threatening fact, the authorities decided yesterday to no longer issue clean bills of health for ships sailing from the port of Antwerp. 'The ships' papers will now bear the words, "On observent des cas isolés de choléra."

Not only is the town of Antwerp thus threatened, but the contamination has already spread to a considerable distance. At Bornheim there have been in the course of three days nine cases and seven deaths. Bornheim is situated on the river at a distance of eighteen miles from Antwerp. It has a population of 6000 inhabitants, but the particular district affected by the cholera has a population of 1200 persons. The disease had been brought to this place by barges from Antwerp. Dr. Desquin, member of the provincial medical committee, hastened to the spot. He found that nothing whatsoever had been done. The cottages inhabited by the people were very poor and dirty. One cottage was in such a condition that disinfection was impossible, and Dr. Desquin consequently advised the mayor to burn the place down. As another instance of the spread of the disease, I should mention that a beggar woman from Antwerp has taken the cholera to a village called Niel, and there have been several cases brought to Malines by bargemen from Antwerp. Here also it has been necessary to burn down some cottages; but I will speak of the Malines epidemic when I have had a better opportunity of obtaining authentic and detailed information. I will also reserve for a future occasion some account of the fresh cases brought to Brussels equally by barges from Antwerp; but there is worse than this. That bargemen should contract cholera at Antwerp and fall ill when they have already travelled some distance from the town is but natural. Nor need such cases cause any particular alarm—at least, if these bargemen are properly watched and isolated as soon as suspicious symptoms declare themselves. But if barges can be disinfected and their crews isolated a river or a canal cannot be so readily purified. On Saturday (Sept. 3rd) news was received by the Provincial Medical Committee that, within the previous two or three days, there had been twelve cases of cholera and ten deaths at Boom. This town has a population of 14,000 inhabitants. It is situated on the Roupele, a large tributary of the Scheldt, and is at a distance of nine miles from Antwerp. No connexion could be established between these cases and the epidemic at Antwerp. There had been no barges coming from Antwerp to Boom with illness on board. The only suggestion as yet forthcoming is that the inhabitants of Boom take their drinking water from the Roupele, and the tide of the Scheldt affects this river. If this be the true explanation, then the water of the Scheldt at Antwerp must be very strongly contaminated for the infection to travel up with the tide, but against the current, so far as Boom. When we consider how far-reaching is the tide of the Scheldt, and that Belgium is honeycombed with rivers and canals, the prospect opened out by the fact that the cholera has, perhaps, been brought to this town by water and not by human intercourse is anything but reassuring.

Some comfort may, however, be derived from the knowledge that the Medical Commission of the province of Antwerp is displaying laudable energy. Unlike the authorities at Jumet, the methods of disinfection enforced in the province of Antwerp are as complete as can be expected or desired. The straw mattresses on which most of the patients sleep are burnt. All the old and worthless clothes, bedding &c. are also burnt. Strings are fastened across the room on which are hung articles of more value. The place is closed up hermetically and fumigated with sulphur for twenty-four hours. After fumigation the walls, floors &c. are washed with a 1 per 1000 solution of sublimate. A cottage is hired by the local authority in which the inhabitants live while their homes are being disinfected, and objects destroyed by fire are replaced at the public cost. This proceeding affords an invigorating contrast when compared with the timid action of the authorities at Jumet. As a final illustration of the spread of the epidemic I have been officially informed that there have been five cases of cholera within twenty-four hours at Ekeran, six miles from Antwerp, on the road to Holland. Here there is no river or water connexion with Antwerp, and no explanation is as yet given as to how the cholera reached this town.

In my next letter I hope to be able to give an accurate account of the drainage and water-supply of Antwerp; but, in the meanwhile, I cannot defer relating what I saw and heard when I called on Dr. Terwagne. This practitioner, backed by the local paper, *l'Opinion*, has caused considerable commotion by denouncing the fatal delays in taking precautions against the cholera. Briefly, and to use his own words, his contention is: "That the cholera broke out at Havre at the commencement of August; that the Belgian consul said nothing about it; that on Aug. 15th the *St. Paul* arrived at Antwerp and cholera ensued. The sailors of the *St. Paul* died at the hospital; the press, the public and the consul remain silent. On Aug. 18th only is the Government informed, and this by letter instead of by telegraph. The Government does not mention the warning received from Havre before the 23rd. During that interval the cases of cholera multiply."

There are three sanitary authorities at Antwerp. The Sanitary Commission of the Scheldt has control over the river and the shipping, but, according to the law, it must take no measures till it receives orders from the Government. No such orders were sent by the Government, and that is why nothing was done when the cases occurred on board the *St. Paul*. When, however, the *Nerissen* also brought the cholera to Antwerp the Sanitary Commission of the Scheldt took the law into its own hands. Though the proceeding was absolutely illegal, still, without waiting for the Government orders, the Commission met and has ever since acted with energy and ability. There can be no doubt that the Government will approve the initiative it has taken and will overlook the illegality of the proceeding. The other sanitary authority is the Provincial Medical Commission, which has to watch over the health of the entire province; and the third authority is the Medical Commission of the town of Antwerp. This latter is purely a local commission, and one of its principal duties in the present emergency should be a house-to-house visitation. I acknowledge that this will be a giant task; but its accomplishment is urgently needed, not merely with regard to the cholera, but with regard to health generally.

To return to Dr. Terwagne, his first experience of cholera was most painful. He was called some three weeks ago to Dinant, the beautiful holiday resort on the Meuse. His father and his brother were in a dying condition; both had cholera and had reached an advanced stage; their skin was blue and cold. Fortunately, though unexpectedly, both recovered. It is important here to note that no mention had nor has yet been made of the existence of cholera at Dinant. Considering the great number of tourists of all nationalities who travel between Namur, Dinant and the forests and mountains of the Ardennes, we ought to be better informed as to what is occurring in those countries. Since his return to Antwerp Dr. Terwagne has had a great number of cases of choleric. On Monday, Aug. 5th, he visited in all thirty patients and eight were suffering from choleric. On the previous Saturday he saw in their own homes fifty patients and nine had choleric. He qualifies choleric as violent diarrhoea and vomiting accompanied with cramps in the limbs and increase of temperature. It differs from the usual diarrhoea noticed every summer by its violence, by the cramps in the limbs and the frequency of fatal results. But the question arises, Where does choleric end and where does cholera begin? When these choleric patients show a decrease instead of an increase of temperature, a leaden, bluish hue and when there are rice-water evacuations, then it is considered to be a case of cholera. Such a case occurred among Dr. Terwagne's patients ten days ago. The victim was a baker living not far from the Rue Deurne, where the first cases of cholera within the town occurred. The doctor at once telegraphed, according to published instructions, to the Minister of Agriculture at Brussels. Though nine days had elapsed when last seen, nothing whatever had been done; neither police, disinfectors, nor any other public functionary had visited the patient's house. Yet the case is the more urgent as the sufferer is a baker by trade, and there may perhaps be some risk of the bread being contaminated. What, then, was the use of telegraphing to the Minister of Agriculture? Now, however, on September 2nd, the Bourgmestre of Antwerp issued a circular asking all medical practitioners to send him a duplicate of the information forwarded by them to the Minister of Agriculture, and there is more reason to believe that the authorities on the spot will take action.

Under the guidance of Dr. Terwagne I visited the Rue Deurne and many other streets which have more especially

suffered from cholera. I will reserve my description of the sanitary condition of this quarter till I have gone into the matter more fully and consulted the town engineer. I have seen things I cannot believe to be true and for which there must be some explanation not apparent to the naked eye. In all directions, in wretched backyards adjoining dirty dwellings inhabited by very poor people, there were open middens side by side with shallow wells from which water is taken for drinking purposes. In one house the pump apparently went right through the midden to reach the well, which seemed to be actually underneath this receptacle of the household filth and the cholera or choleric dejections. A death from scarlet fever had occurred here last week. In the Rue Deurne, where cholera has spread in several of the houses, I found in a court two midden closets within a few inches of a well and by the other side of the well a stable containing cows. The pails which carry the milk are washed with water from this well; and it is in the surrounding houses that the greatest number of cases of cholera have occurred. With such facilities for contaminating milk, it is not surprising that the cholera should break out in different parts of the town apparently disconnected one with the other.

#### CHOLERA IN FRANCE.

Our Paris correspondent writes:—In my last correspondence I informed your readers of the terms of the regulations now in force at all the frontier railway stations from Dunkerque to Delle. I am able to-day to send a specimen of the passport supplied to passengers who are, after examination, recognised to be free from choleric symptoms. All reasonable people will allow that the formalities are not very onerous. The pity is that they were not put into force much earlier. Hotel and lodging-house keepers are bound by the terms of the same decree to immediately declare the presence in their establishments of any traveller who has arrived from Belgium or Germany. Medical men or heads of families are, moreover, required to report within twenty-four hours any suspicious case that may come under their notice. The importation of rags and bedding from Russia, Germany or Belgium is disallowed until further notice, and the same restrictions obtain in the case of fruits and vegetables grown in these countries. On Friday last a report of the insanitary condition of Paris and its environs was read to the Sanitary Council of the Seine by Dr. Dujardin-Beaumetz. That gentleman announced an evident increase in the prevalence of cholera. While the mortality from the disease in Paris from Aug. 4th to Aug. 17th was only 16, the figures for the period comprised between the 18th and 31st of the same month had reached 175, the increase being elevenfold. In the suburbs the corresponding figures were 33 and 75 respectively. Dr. Dujardin-Beaumetz comforts himself with the reflection that for a population of 3,000,000—i.e., the population of the Seine-Department—the deaths from what he still denominates choleric diarrhoea were only 16 (or 1 in 20,000) a day for the last fortnight of August. The officials assure the public that "the above statistics allow of the conclusion that in Paris and its environs we have still to deal with the same choleric diarrhoea that has been prevalent for the past five months, and that not a single case of Asiatic cholera has yet been seen amongst the Parisian population." The most recent *Bulletin hebdomadaire* to hand tells us that there were in the Paris hospitals under treatment on Aug. 21st for *affections cholériques* 41 patients; that the total number of admissions for the same malady for the period comprised between Aug. 21st and 27th was 254. In the same period 57 were discharged and 70 died, thus leaving under treatment on the evening of Aug. 27th, 168 cases. The mortality for the whole of Paris on Friday, Saturday and Sunday last, was 29 and 14 respectively. At Havre, the fresh cases on Saturday and Sunday last were 27 and 41. Dr. Proust states that while the mortality in Hamburg in three weeks has been 2558, in Paris only 365 persons have succumbed to cholera in five months. Dr. Martin tells us that arrangements have been made so that as many as 100 disinfecting processes could be conducted in the public ovens now at work in Paris.

#### CHOLERA IN GERMANY.

Our Berlin correspondent informs us that the thirty-fifth number of the "Publications of the Imperial Office of Health," dated Aug. 31st, contains the following: "The

first cholera cases in Hamburg occurred on Aug. 16th, and the patients were almost exclusively persons who were occupied at the harbour or went up and down on the Elbe. The contagion was, in all probability, brought by emigrants from Russia and communicated by the passing of the water with which their linen &c. had been washed, and of all their excreta, undisinfected into the arm of the Elbe near the barrack built for them, which was the more dangerous as the water-supply of the city is taken from the river at a point not far distant. The correctness of this explanation has been rendered almost certain by the observations made by Privy Medical Counsellor Professor Koch and Government Counsellor Dr. Roth on the spot at the instance of the Imperial Office of Health." The *Hamburger Fremdenblatt* declared on Wednesday evening that about 2000 persons have died of cholera since the 20th ult. who were not reported as having died of cholera and that consequently the official lists were worthless. Happily the Hamburg-Altona epidemic has not yet spread to other parts of Germany, though isolated cases have occurred in a good many places, including Kiel, Bremen, Lübeck, Hanover and Berlin.

Professor Virchow has returned from Russia and took part in the deliberations of the Berlin Public Health Committee on Wednesday last. He condemned the unwillingness of the heads of hospitals to receive cholera patients, and declared that the fear of infection is quite unfounded. The idea that the cholera spread through the air was an error which was more and more disappearing from the minds of men; in the main it spread only through the evacuations; it was necessary, therefore, to exercise all possible caution with regard to them, which could be done most effectively in hospitals. The Charité had not hesitated to receive cholera patients. The same was done in St. Petersburg and Moscow, where cholera patients lay in rooms close to those where other patients were. A tendency in the same direction was observable in England, and the Germans would have to follow. New barracks were open to objections; it was difficult to erect them so as to meet all requirements, especially as regards connexion with the public sewers.

#### CHOLERA IN AUSTRIA.

Our Vienna correspondent states that up till the present no case of cholera has been reported in Austria, although great numbers of people are now returning from the watering places on the Baltic Sea. At all frontier stations passengers from Germany, France and Russia and their luggage are subjected to disinfection and to medical observation during the first five days of their residence in Austria. Disease and mortality rates have been extremely low in Vienna during the last few weeks. Even the intense heat of August did not cause more than fourteen cases of death by sunstroke. Sanitary inspections are proceeding vigorously. No less than 360 dead cats and dogs have been taken out of the Wien, a stream which runs through Vienna.

#### MEETING OF THE ROYAL COLLEGE OF PHYSICIANS OF LONDON.

An extraordinary meeting of the College was held on Saturday last, the 3rd inst., to consider a communication from the Secretary of the Local Government Board asking the advice of the College as to the means best adapted to the immediate medical treatment of patients suffering from cholera, choleraic diarrhoea, or diarrhoea, the same to be communicated by the Board to the local sanitary officers throughout England and Wales. A memorandum in reply to the communication was submitted to the meeting, and was, after consideration by Sir Andrew Clark (the President), Sir George Johnson, Sir Joseph Fayrer, Sir George Buchanan, Dr. Russell Reynolds and the acting Registrar, sent to the Secretary of the Local Government Board.

#### SYMPTOMS AND TREATMENT.

We have received from several correspondents hints and suggestions regarding the symptoms and conditions to be met with in cholera, and also as to the drugs most useful in the treatment of the disease. Thus Surgeon-Major P. J. Damania draws attention to the importance of the suppression of urine as a diagnostic factor of the disease, and he also alludes to the absence of pain in the intestine.

Mr. E. Hurry Fenwick writes drawing attention to the hæmorrhage and œnuria which, in Dr. Prout's opinion, was a sequence of cholera: "Dr. Prout ('Stomach and Urinary

Disease,' 1840, p. 23) records his experience thus: 'I saw about the time the cholera prevailed and a little afterwards more cases of oxalate of lime calculi and of formidable hæmorrhage from the kidneys than I have ever previously seen during the whole of the long period that urinary disease had occupied my attention.'"

Dr. George Herschell refers to the prophylactic treatment of cholera. He writes: "I venture to suggest that the most scientific treatment of the preliminary diarrhoea of cholera, which, after all, may be an effort of nature to get rid of the *materies morbi*, will be first of all a good purge of castor-oil or calomel, and then a course of dilute hydrochloric acid given sufficiently often to prevent the establishment in the stomach at any time of an alkaline or neutral reaction. This might be combined with advantage, if the diarrhoea were excessive, with a vegetable astringent or an antiseptic. A perfect intestinal antiseptic is still a desideratum, but judging from its action out of the body, pyktoaurin (yellow) should prove the most destructive to the cholera germs if it turns out that it can safely be given in sufficient doses without unpleasant symptoms."

Mr. E. Tegart forwards us a communication which appeared during the last epidemic in a contemporary, signed by his father, Mr. Edward Tegart, Inspector-General of Army Hospitals, in which a case is quoted as having been cured by the administration of three drops of croton oil on a lump of sugar. The late Mr. Tegart continued: "Ever since the appearance of the Asiatic cholera in this country I have not ceased to urge the employment of croton oil to my professional brethren, and even to the Central Board of Health, but in vain, for I have never yet heard of its being resorted to. I was induced to recommend it from the decided success I witnessed of its utility in yellow fever and other diseases in the West Indies bearing a strong resemblance in many of the leading symptoms and appearances after death to those of the epidemic cholera. My reasoning therefore was from analogy; but the practical facts detailed in my personal case confirm the strong impression on my mind that the croton oil will prove an invaluable remedy in spasmodic cholera."

#### MILITARY PRECAUTIONS IN DUBLIN.

The military authorities have made the following precautionary arrangements:—"Bell-tents and hospital equipment sufficient for fifty patients to be stored in Pigeon House Fort ready for immediate use. On notice being received from the Medical Department of a case of cholera having occurred among the troops the hospital will be pitched, and every man that can possibly be spared will at once be withdrawn from the Pigeon House Fort, as well as the whole of the married families. All the available accommodation in the fort will be handed over to the medical officer in charge of the cholera hospital."

#### SANITARY REGULATIONS.

No more cases of cholera have broken out in Liverpool, though two vessels from Hamburg arrived in the Mersey on the 6th inst. The vessels were boarded by Drs. Taylor and Hope and the crews found to be perfectly free from the disease.

#### PREVENTIVE MEASURES IN ROUMANIA.

Dr. A. Irwin Bolton writes from Constanta stating that great preparations, in a hygienic point of view, are being made there and in all Roumanian towns, in anticipation of the arrival of cholera. In Roumania all water-closets and cesspools are regularly inspected, and the proprietors of hotels, private houses, &c., are obliged, under threat of legal proceedings, to have such places saturated twice a month with antiseptics. All private and unnecessary wells have been closed, and drinking water is only allowed to be drawn from those which are under the immediate care of the municipality. A strict quarantine system is adopted in the port. Every arrival is inspected minutely, and all passengers before landing are disinfected. The measures adopted there are certainly very creditable to the authorities. He continues with the following statement:—"My opinion is we shall escape it this year. The warm season will soon be drawing to a close, and then we shall have moderate daily temperature with cool nights, and under such circumstances cholera is not likely to progress. But I feel certain we shall have it next year, for it is unknown in the history of cholera to find it advance so far as it has at present without its extending its visit into the interior of Europe. Let us hope that by the well-directed and timely precautions adopted by the Roumanian authorities, both medical and otherwise the

great misery and mortality caused by this dire pestilence may be mitigated."

#### PRECAUTIONS IN SEAPORT TOWNS.

Circulars containing elaborate instructions have been issued by the Medical Officer of the Burgh of West Hartlepool, by the River Town Port Sanitary Authorities, and by the Burgh of Folkestone. The Port Sanitary Authority of Dover has issued to every captain a copy of a document relating to the cross-Channel traffic.

### LIFE ASSURANCE AND THE MEDICAL PROFESSION.

SINCE the appearance of our last special article containing notices of the Life Assurance Companies' Accounts we have received a considerable number of additional reports. For the most part these documents contain very little information beyond the assurance that the issuing company, be it which it may, continues to thrive and has secured a return of new business proportioned to the expectations of its directors founded upon the past history of the society. To this class must be referred the Commercial Union, which transacts the three branches of life, fire and marine insurance, and appears to succeed very respectably in every several department; the Eagle, which, confining its attention to life assurance, maintains a steady course of business upon well-established and well-approved lines; the Hand-in-Hand, a very old company, conducted on the mutual plan, which this year submits the report for the 195th year of its existence; the Liverpool and London and Globe Insurance Company, which, giving attention chiefly to the fire department, transacts an enormous business in that branch, which somewhat overshadows the smaller transactions of the life assurance department; the National Provident Institution, a society designed originally to meet the requirements of the middle-class policy-holder, which has succeeded in realising its founder's intentions in a remarkable degree; the North British and Mercantile, a company which has launched upon the dangerous experiment of accepting proposals for members of the Civil Service without requiring a medical examination, and is not very communicative as to the present financial result; the Provident Clerks' Mutual Life Assurance Association, which, as its name imports, aims at reaching the large class of mercantile clerks, and in a very considerable measure attains its object; the Standard, a large and well-established Scottish office, of which one might expect to read some interesting details concerning a very widely extended business; and the Scottish Amicable, another North British institution of large connexions and established reputation, which is represented by a very meagre though somewhat prolix report. Among those which present points of interest in their reports mention must be made of the Metropolitan, an old mutual society, whose directors announce an intention to liberate their policies in future from all conditions "not found to be absolutely necessary." These somewhat vague words are not defined, and it is therefore impossible to judge what the extent of the remission is likely to be; but having regard to almost complete freedom from conditions which some companies offer, it may be taken for granted that the conditions which will remain will not be onerous. The National Life Assurance Society and the Scottish Widows' Fund both report exceptional mortality due to the visitation of influenza which has marked the past year, and in both cases it is observed that the high mortality rate has been chiefly noticed among the old policy-holders. The directors of the Star Life Office, on the contrary, remark that influenza has touched them only slightly, a difference which is probably in great measure a mere matter of accident, although it may be partly due to a different age distribution among the lives at risk. The Star, as a younger office, and one which has experienced very great expansion in recent years, would probably have a smaller proportion of aged policy-holders upon its books, and to that extent it would, quite consistently with the record of the other societies already mentioned, enjoy a comparative immunity from the attacks of influenza. Last may be mentioned the Union Assurance Society, which, established so long ago as the reign of Queen Anne, has exhibited within the past

three or four years a power of growth unexampled in its own earlier record, to which the return now made public puts a fitting crown.

### ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD FOR IRELAND.

FROM the twentieth annual report, which has just been issued, it appears that there has been a further decline in the average daily number of persons relieved in the workhouses, while there has also been a slight decrease in the average daily number of persons who received out-door relief. The average daily number in the workhouses was 40,742, and on out-door relief 62,229, or a total of 104,078, which was less than the average daily number in workhouses and on out-relief by 1053. During the year ended March 5th last the total number of deaths in the various workhouses was 10,937, showing an increase of 1130 deaths as compared with the number for the preceding year. Of these, fever caused 337, against 296; lung disease 2208, against 1843; phthisis 1171, against 1021; brain disease 363, against 359; and heart disease 598, as compared with 570. There were for the twelve months ended Sept. 29th last 47,625 persons admitted into the workhouses for sickness, being a decrease of 7835 as compared with the previous year, a decrease of 12,847 in the number admitted who were not sick, and a decrease of 918 in the number suffering from fever or other contagious disease. In the various dispensary districts the medical officers attended 394,880 new cases at the dispensaries and 161,362 persons at their own homes, or a total of 556,242; gave certificates for 1901 dangerous lunatics, and vaccinated or revaccinated 90,693 people. The vaccination returns show an increase of 415. There were 13 cases of small-pox treated by dispensary medical officers and 3 deaths in workhouses during the year. During the winter of 1891-92 a second well-marked outbreak of influenza became epidemic in Ireland. This latter visitation was not attended with symptoms quite so severe as those which occurred in the outbreak during 1889-90, and it has differed from the former epidemic in one important respect. The previous epidemic as a rule spared the aged, whereas the more recent outbreak has fallen with impartial severity upon persons of all ages. From reports received it appears that very large numbers of the population were affected with influenza during the past winter, and, in consequence of persons of advanced age having suffered, the mortality in proportion to the numbers attacked has been greater than that recorded during the prevalence of the former epidemic. As regards fever, there were 2916 cases attended by dispensary medical officers, being a decrease of 1369; and a decrease of twenty-one in the cases of scarlet fever treated, the numbers being 1238 and 1259 respectively. The Medical Charities expenditure amounted to £166,330, under which heading is included the cost of medicines and medical appliances, salaries of medical officers and apothecaries, vaccination fees and other expenses, showing an increase of £4989 over that of the previous year. The Board sanctioned loans, amounting to £189,177 18s. 4d., to various towns in Ireland, principally for sewerage and water-supply, which, added to previous sums allocated, constitute a total of £2,273,302 18s. 6d. for the seventeen years ended March 31st, 1892. The total number of lunatics, epileptic lunatics, idiots and epileptic idiots in workhouses was 2024, against 1888 the previous year. The following: extract from the fortieth report of the inspectors of lunatics, referring to the condition of lunatics in workhouses, has been forwarded to each Board of Guardians by the Local Government Board, pending legislation, as a means of immediate improvement:—1. That in all cases paid officers should be made responsible for the care and treatment of lunatic inmates. 2. That mechanical restraint should never be used except by the recorded direction of the medical officer, in whose charge strait waistcoats and other instruments of restraint should be kept. 3. That so far as possible separate day-room and dormitory accommodation should be provided. 4. That every effort should be made to find employment for such insane patients as are able to work. There is no better employment for men than spade labour, or than laundry work for women, and both occupations might be provided in nearly all the workhouses. 5. That cold and dark idiot cells should be disused.

## THE ACTION OF CHLOROFORM.

DR. HOBART A. HARE of Philadelphia has undertaken a research into the action of chloroform on behalf of H.H. the Nizam of Hyderabad's Government. The following is a copy of the letter which has been addressed to him by Surgeon-Lieutenant-Colonel Edward Lawrie:—

To DR. HOBART A. HARE, Philadelphia, U.S.A.  
The Residency, Hyderabad, Deccan,  
Aug. 18th, 1892.

MY DEAR DR. HARE,—In reply to yours of the 9th ult., I beg to note a few points in regard to the present position of the chloroform question which may be of interest to you in commencing your independent chloroform research on behalf of the Hyderabad Commission.

My students administer chloroform with perfect safety in all cases which are fit for an operation. The principles on which our practice is based are that the heart is never affected by chloroform except by overdosing; and that safety, or the avoidance of overdosing, is guaranteed by regular breathing. It is not necessary to add that the administration must not be pushed beyond full anaesthesia, because, if it is, the essential condition, which is normal respiration, cannot be maintained. It stands to reason that if these principles are unassailable they must be founded on sound physiology, and experiments on animals must accord with them. We are satisfied that the Hyderabad Commission's experiments not only do accord with them, but entirely confirm our clinical experience. Our opponents assert that this is incorrect; they allow that our clinical teaching is right, but not on the grounds put forward by the Commission.

Dr. Gaskell believes that the lowering of the blood pressure by chloroform is due to weakening of the heart and is therefore dangerous, and that this action of chloroform is shown in the tracings of the Hyderabad Commission's experiments. The contention of the Hyderabad Commission is that the fall of the blood pressure under chloroform is in itself harmless, and is due to vaso-motor narcosis. Dr. Gaskell says our clinical teaching is correct, but will never be accepted as long as we insist on what is not true—viz., that chloroform does not directly affect the heart. Our reply is—"Why, in order to get our teaching believed in, should we first of all adopt a theory which is altogether opposed to it?" Dr. Gaskell further says: "The true physiology on which your teaching is founded is that chloroform does affect the heart directly, but you never produce this action because you take good care not to give the concentrated vapour." This is not so. Our only fear of the concentrated vapour is that it may interfere with the breathing. (Vide Chloroform Report, pages 200-203.) If the breathing is regular we do not care how concentrated the chloroform is. In support of this statement the following record is quoted from the case-book of the Afzul Gunj Hospital:—

"No. 1432. Pentoo, delicate female, aged three years. Disease, abscess. Chloroformed at the Afzul Gunj Hospital at 11 h. 40 m. 30 s. on Aug. 9th, 1892, by student Mullannah. Time occupied in producing full anaesthesia, 47 seconds.

## OBSERVATIONS.

H.	M.	S.	Observations.
11	40	30	Chloroform on cap, saturated; crying loudly; inhalation regular; cap held close over the face.
11	41	0	Unconscious. Natural breathing, quiet and regular.
11	41	10	Snoring.
11	41	17	Over; cornea insensitive; cap removed.
11	42	0	Incision made.
11	45	30	Operation and dressing finished.

"Remarks.—In this case the child began to cry loudly and continuously the moment it was placed on the operation table. The breathing was thus regular, and the chloroformist was told to keep the saturated cap close over the mouth and nose in order to prove to the clinical class that it does not matter how concentrated the chloroform is if the respiration is not irregular. Deep anaesthesia was produced in forty-seven seconds."

4. The experiments of the Hyderabad Commission explain precisely and clearly the reason why the administration of chloroform on Syme's principles is free from risk. It is not pretended that these experiments demonstrate exhaustively all the causes of the fall of the blood pressure under chloroform, but they prove that the fall of pressure from the direct effect of chloroform is harmless. This could not be the case if it were due to weakening of the heart, and it is in all probability entirely accounted for by vaso-motor narcosis. When the respiration is failing, or stops, from overdosing, the fall is increased by, and becomes dangerous in proportion to, the consequent interference with the action and nutrition of the heart. The action of the heart may be injuriously affected at any time during the inhalation of chloroform by abnormal or irregular respiration. Moreover, the vagus nerve may be brought into play and stop the heart and cause sudden falls of the blood pressure. These sudden falls are not of themselves dangerous, but they are warnings of asphyxia or of overdosing, or of both combined. They can never take place clinically if the respiration is properly attended to.

5. The whole controversy on chloroform turns on one point. Is the fall of blood pressure under chloroform harmless, as we say it is, or dangerous, as is asserted by our opponents?

6. In the present state of our knowledge three main factors are concerned in the lowering of the blood pressure shown in the tracings of the Hyderabad Commission:—

(1) Narcosis of the vaso-motor centre or centres, due to the direct action of chloroform. This is harmless and does not appreciably affect the pulse.

(2) Stimulation of the vagus, due to the indirect action of chloroform. This is also harmless, but is a sign of dangerous administration and stops the pulse temporarily.

(3) Weakening of the heart from narcosis of the respiratory centre and failure of the respiratory function, due to the indirect action of chloroform as regards the heart, the direct action as regards the respiratory centre. This is excessively dangerous, and if the respiratory function is not restored proves fatal. It weakens and permanently stops the pulse.

Clinically, lowering of the blood pressure is inseparable from the effective inhalation of chloroform, but the falls of pressure due to stimulation of the vagus and weakening of the heart ought never to occur. If they do they are signs of improper administration or overdosing.

7. Our principles form the true guide to the only safe method of chloroform administration, which consists in the concentration of the chloroformist's attention on the respiration alone throughout the entire inhalation. The "direct heart" theory leads to attention to the pulse at the expense of the respiration, and has undeniably resulted in a certain percentage of deaths under chloroform over and above those which are liable to occur from mere accident or carelessness under any system of administration.

8. It remains for scientists to demonstrate that these principles are physiologically accurate, by experiments which will confirm and amplify the research of the Hyderabad Commission. Unless the clinical and the experimental aspects of physiology are at variance, which is obviously impossible, it must be practicable to verify our clinical experience by physiological experiment.

Yours very sincerely,  
EDWARD LAWRIE.

## THE PHARMACEUTICAL CONFERENCE AT EDINBURGH.

THE pressure on our space in connexion with the Students' Number led to the unavoidable postponement of notice of the very successful Pharmaceutical Conference at Edinburgh. The address of the President, Mr. E. C. C. Stanford, was, as might almost have been expected, more a retrospect than a forecast. Mr. Stanford was one of the founders present at the inaugural meeting in Newcastle in 1863; hence he could scarcely fail to find interest in the progress and the changes which have occurred since the foundation of these annual gatherings. In reviewing the progress he is clearly correct in summing up its teaching with the idea that the scientific, not the commercial, side must be considered first. Although every record of industrial progress seems necessarily to have to deal with thousands and with millions, and with the struggles by which these thousands and millions are produced within our shores instead of abroad, it is none the less true that the initial step is most frequently taken without any idea of the future it entails. The step forward is probably made by some scientific worker who agrees with Mr. Stanford that in this purely commercial age "money is not everything." "We want a diligent search for new truths, we are content to wait for their application." Naturally enough, in looking backward to the "little inaugural meeting" held in a small room at Newcastle in 1863 the first thoughts to arise were tinged with regret in noting the serious gaps made in the ranks, and the President touched with sympathetic hand upon the deaths of Deane and Brady, of Hanbury, Stoddart, Williams, Mackay and Redwood, whom he described as "men with a halo around them, shedding light and love on all who came within their benign influence, men abounding in an enthusiasm which was wonderfully catching." The indications of national progress during the lifetime of the Conference—the parcel post, the sixpenny telegram, the telephone, the phonograph, the microphone and the type-writer, which have all had their bearings upon pharmacy—led Mr. Stanford to regret that the type-writer was "unfortunately not yet used for prescriptions, though, perhaps it would save more time in that than in anything." We have often dealt with the occasional illegibility of physicians' prescriptions, but we think that the time has scarcely yet come for the mechanical type-writer to be thus employed. Would a chemist be justified in refusing to compound a prescription signed with type-written initials? Would a patient be satisfied with a document which might perhaps have been entirely the work of a clerk, or if dictated, might possibly have been misunderstood? The changes in the employment of gas, of electricity and of steam power were briefly touched upon, and the great strides of hygiene were indicated by the gratifying diminution in the death-rate of both Edinburgh and Glasgow. In all these changes, however, the work of the pharmacist is less obvious than it is in connexion with some of the manufactures, where the introduction of new methods has practically revolutionised the work of thirty years ago. The new science of chemical engineering has sprung up during this period and has led to the introduction of the filter press, the hydro-extractor, the vacuum pan, the multiple evaporator, and many other inventions which have been of invaluable service to manufacturing chemistry and pharmacy. The alterations in the alkali trade and the improvements by which much of the material previously regarded as "waste" is now collected and utilised have formed marked features during

the period under review. These changes have not only been a source of profit, but they have removed materials which formerly constituted serious dangers to health. The importation of frozen meat as the result of the application of the condensation of volatile hydrocarbons, the enormous new industry consequent upon the recognition of the value of the coal-tar colours and the introduction of such antiseptics as carbolic, cresylic and salicylic acids, or of such febrifuges and anodynes as salicin, antipyrin, antifebrin and phenacetin, all indicate phases of progress in the application of pharmaceutical processes. It is true that the bulk of the manufactures of finer chemicals is in the hands of German chemists, who are still ahead in the education necessary for this work; but this knowledge should act as a stimulus to those who have to supervise the earlier training of the rising generation. Naturally, therefore, we have to consider what are the points of difference in English and German training.

Coming thus to the knotty question of education, although reference was made to the board schools and free libraries and the general improvement in the establishment of State education, there did not appear to be much that was satisfactory to record in secondary, technical and university education, and the tardiness in the establishment of a real teaching university in London was compared unfavourably with the rapid educational advances of Germany. Dealing more purely with pharmaceutical education, Mr. Stanford quoted from Dr. Stevenson "that many young men of defective education still unsuccessfully attempt to enter upon the business of pharmacy, most of them failing in simple arithmetic." This defective school training is the greatest drawback to the due elevation of pharmacy, and it is one of which the Pharmaceutical Society are fully conscious.

The sale of poisons and the ethics of patents, more particularly of patent medicines containing poisons, were dealt with in strong terms not devoid of humour, and the remarks of THE LANCET upon the recent action taken by Government against the proprietors of chlorodyne were referred to approvingly.

It is impossible in the space at our disposal to follow in detail all the interesting and suggestive topics touched upon in the course of this address. A few sly hits were made at the medical profession, one being the quotation of the following advertisement from a Glasgow daily paper: "To Druggists.—Wanted, young woman or youth to keep doctor's shop for a week." The concluding remarks, however, concerning young pharmacists might find a wider range of cheering application: "If they are the least afraid that there may be any difficulty in finding a place for a well-educated man, let me remind them of the saying of a canny old Scotchman, so characteristic of his persevering race—'There's aye room at the top.'"

## THE MIDWIVES' REGISTRATION BILL.

THE following is a brief digest of the evidence of the witnesses who have been examined before the Select Committee of the House of Commons appointed to consider the question of the Compulsory Registration of Midwives. The following Members were nominated to act on the Committee:—Mr. J. A. Bright, Mr. Tatton Egerton, Dr. Farquharson, Sir Frederick Fitz Wygram, Dr. Fox, Mr. Howorth, Sir Guyer Hunter, Mr. Fell Pease, Mr. Rathbone, Mr. Stephens and Mr. Arthur Williams.

Dr. LEITH NAPIER detailed his long experience and extensive practice in midwifery. He dwelt on the necessity of the services of midwives in the country and out lying districts, it being impossible in many places for medical practitioners to undertake all the midwifery cases, and he referred to the uneducated and untrained character of the majority of midwives. He did not think that medical men would suffer from a system of registration of midwives, but he took exception to the Bill of last session. With regard to the control of registered midwives by the County Councils, he would like the registration to be entrusted to a central council, elected from county councils and assisted by examiners. The term "registered midwife" would, he thought, be a sufficient reward for having passed the Obstetrical Society examination. It would be an advantage, he thought, if students were accompanied to their cases by trained midwives. London afforded an ample field for the training of midwives. Asked by Dr. Farquharson if he expected midwives to attend only natural labour, and what definition he could give of natural labour, he said it seemed to him impossible to agree upon a precise definition of natural labour. He thought by the term "natural labour" one might understand that the midwife was not to employ instruments in delivery; that she was not to perform what were called major operations, such as version; that in the event of any decided obstacle occurring she should, if possible, procure the services of a medical man; but a midwife should, he thought, be trained in such a way that in the event of a dangerous complication arising she should not be punished if she carried out a procedure such as a doctor would under the circumstances. For instance, there were some cases of arm presentation where the midwife might save the mother's life as well as the child's by

timely interference; and it seemed to him, although this was not a natural labour, that she would not be exceeding her functions if she was conserving life. It would be extremely difficult to make it a penal offence to sometimes interfere in that way. Natural labour was a well-understood term, and if it were left to a controlling body to say whether a woman improperly exceeded her functions, it would be a simple matter to withdraw her certificate. There were twenty-five different definitions of natural labour, and one of the great exponents on the other side gave a definition of natural labour which to his mind it was absolutely impossible to accept.

Miss ROSALIND PAGET, Treasurer of the Midwives' Institute, said there were ample facilities in London, Liverpool and Glasgow for good training in midwifery. The total number of midwives that had passed the examination of the Obstetrical Society was 1184. The distinction between a monthly nurse and a midwife was, in her opinion, that the monthly nurse worked under the doctor, and was under his directions and orders in the same way as was a general hospital-trained nurse. A midwife, however, worked by herself, and only called in a doctor when she saw need; therefore there was more responsibility in her case. A monthly nurse simply waits on the doctor. She objected to women calling themselves midwives unless they had been trained for such responsible duties.

Miss REBECCA V. GILL, Secretary of the Workhouse Infirmary Nursing Association, deposed that there was a great waste of training material in such limited use being made of the workhouse infirmaries of London and many of the large provincial towns. Kensington was the only workhouse infirmary that took pupils. The Association with which she was connected had trained twenty-five midwives.

Dr. J. H. AVELING, consulting physician to the Chelsea Hospital for Women, stated that for thirty-three years he had been endeavouring to forward the amelioration of midwives in this country. He had written and talked a great deal on the subject. He would divide the remarks he had to make under two heads: public utility and public safety. On the first heading he would simply say that during all time there had been a demand for the supply of midwives. Midwives were useful to medical men themselves in relieving them of tiresome and unremunerative work, and in acting for them in cases where they were not able to arrive in time to officiate. It often happened that they were engaged with other cases, or were visiting at a great distance, and therefore unable to arrive in time to superintend a confinement; and then it was a great source of comfort to have a competent assistant to do the work for them, and in natural labour a midwife will do that efficiently and safely. Again, midwives are indispensable to the poor women of this country, whilst a doctor is a luxury they cannot afford. When a doctor attends he requires a larger fee than a midwife, and another person in the shape of a monthly nurse is required to do other offices which the medical man could not and would not do; consequently, there are two expenses when a medical man is employed. When a midwife officiates she fulfils both offices; she does the act of the doctor and of the monthly nurse, and in this way economy is effected. Midwives must therefore always be necessary for the help of poor women. Further, it had been computed that there are in England and Wales from 10,000 to 15,000 women acting as midwives who attend annually 450,000 labours. The number of women following this calling and the extent to which they are employed show how great is the public demand for the services of midwives. He proceeded to give the data on which he based the calculation that by the employment of properly trained midwives the number of deaths in childbirth might be reduced from 4500 to 1500 a year. He laid down as a proposition that no woman should be allowed to call herself a midwife unless she had been trained and registered, this being the object of the present Bill. There was no intention to interfere with women acting as midwives, though they were not registered, so long as they did not assume the name of midwife. Asked whether he could define natural labour, he replied that the lying-in hospitals had no difficulty in defining it; they all defined it, and the midwives of the different hospitals knew what cases they were to attend and in what cases it was necessary to send for help. He believed it would be a great advantage to the medical profession if the training and position of midwives were improved. In his view public utility and safety had to be considered before the advantages and remuneration of the medical profession. In answer to the Chairman, he stated that it was from seeing in his own practice so much damage resulting to women from the want of proper attention that he was induced to take up this question thirty-three years ago. He saw several deaths from the malpractices of midwives, more especially in arm-presentation cases, where the child is very seldom born without assistance. In those cases the midwives allowed their patients to go on, hoping that nature would complete the labour, and it ended in the death of the patient. Death did not represent all the misery caused by malpractice.

Dr. RENTOUL was the next witness. He stated that if midwives were registered it would practically repeal the Medical Act of 1858, for by the Medical Act of 1858 any person who was qualified as a physician, or surgeon, or apothecary had the power of being placed on the Medical Register. By this system the country was supplied with a number of what we call partially educated or partially qualified medical practitioners. This was recognised to be a public evil, and when in 1882 the Royal Commission was appointed to report on the Medical Acts, they said: "It is our opinion that the holding of a licence ought to be conclusive evidence of sufficient proficiency in medicine, surgery and midwifery"; and consequently, when the Medical Act of 1886 was passed, Section 2 enacted that "on and after the appointed day a person shall not be registered under the Medical Acts in respect of any qualification referred to in any of these Acts unless he has passed such qualifying examination in medicine, surgery and midwifery." For a considerable time there had been a tendency to disassociate the practice of midwifery from the practice of medicine and surgery. The nickname of "man-midwife" had been applied to doctors who had the courage to try to raise midwifery to the level of medicine and surgery, and therefore helped to do away at least with the terrible mortality that afflicted lying-in women. The Royal College of Surgeons of England refuses to admit any medical practitioner to their Council who practises midwifery, and up to some time ago the Royal College of Physicians refused to give their Fellowship to any person who had practised midwifery. Even yet there was a strong tendency to disassociate the practice of medicine from the practice of midwifery. Many members of the profession hold that if we had a new Act passed to register a certain class of persons in this country to practise mid-

wifery the Medical Act of 1880 would be at once repealed. The first Midwives Bill said that women were to practise as midwives, not as medical practitioners, but that same Bill gave the midwife power to claim a fee in a court of law for any obstetric operation. Therefore, though called a midwife, she would have had power to claim fees in a court of law as a medical practitioner had. This was recognised as an evil, because in the second Bill her duties were defined to attend cases of natural labour only; but as the term "natural labour" was not defined in that Bill, and more especially as no penalties were imposed upon any midwife who had exceeded her duty, it was practically useless as defining the duty of a midwife. He went on to state that it was the practice in foreign countries not to tie midwives down to cases of natural labour. Another argument used by the witness was that in this country it would be impracticable to have midwives thoroughly supervised, and he submitted that the registration of a low order of midwife practitioners would increase criminal abortion and criminal still-births, and that still-births should be registered in this country as was done in all other European countries except Russia. He further adduced evidence to show that the working classes were already thoroughly provided for in maternity cases through the means of friendly societies and other agencies. He dissented from the view that the practice of midwifery had improved or that the mortality had decreased, and took strong exception to the proposal that medical students should accompany highly trained midwives in their practice. He also pointed out that, as if it was true that a medical student, after four years of study and medical training, including a complete course of obstetrics and gynecology was not qualified to attend midwifery cases, even of a simple character, except at his own risk, it would be absurd for this committee to recommend a change in the direction of legally qualifying women for practice of this kind who had no previous knowledge even of the elementary facts of physiological processes or of therapeutics after a perfunctory course of three months' training in a maternity hospital. In conclusion, Dr. Rentoul did not see the necessity for any legislation upon the question at issue, and disapproved of the creation of any new order of medical practitioners. The demand for midwives was only made on the ground of cheapness.

Mrs. M. H. MARTIN was called in and examined. She had had experience in the superintendence of midwifery in the country district of Upton-on-Severn. She quoted instances of very unsatisfactory results arising from the untrained character of midwives. Great improvement had arisen since the introduction by the witness of trained midwife nurses. Mischief arose from untrained women neglecting to send for the doctor in time of danger, and this was where the services of trained midwives were valuable.

Dr. LOVELL DRAGE, who had had extensive practice in maternity cases in country districts and had been assistant in the out-door maternity department of St. Bartholomew's Hospital, objected, on the ground of principle, to the last Registration Bill. He took objection to the principle of the registration of midwives because it reversed the policy of the last Medical Act. In his evidence he quoted a case to show the necessity for a complete training in medicine and surgery for those who practised midwifery. He opposed any introduction into the profession of an uneducated class of people on general educational grounds. This was a proposal for establishing a class to attend the poor inferior to that established for the rich. Dr. Drage then proceeded to consider the report of the Committee of the Royal College of Surgeons appointed to inquire into the principle of midwives' registration. Six members of that Committee were avowed champions of the principle of registration. Drs. Priestley, Playfair, Farquharson and Champneys, the obstetrical and other bodies, had all shown their feigning in favour of the registration of midwives. The Council and the Fellows were not representative of the profession at large. He called attention to the result of midwifery practice in Austria and Hungary which had been related in a paper by Dr. Walker and read before the Carlisle Medical Society. The paper contained the following statement:—"Legally all other persons are forbidden to act in the capacity of a midwife, but practically the law is a dead letter, and quite a number of women, especially in the country, are attended by their friends, just as with us. Accusations of malpractice are rare. When they are brought they are tried before the ordinary courts and the punishment is summary. Unnecessary delay in sending for a physician is also punishable, but of course such a thing is difficult to prove." The speaker hoped the Committee would bear that statement in mind, because it was a very true one. "If it can be proved, the midwife is severely punished." Then, Dr. Walker further says "One point which I especially inquired about was the result to the perineum." He did not know whether he ought to explain to the Committee these technical details, but he thought the Committee ought to understand this: that these accidents to the perineum are practically tears of the part of the body between the two passages, and it is a very important matter that these tears should be sewn up at once and properly treated. So therefore Dr. Walker inquires specially as to the result of these accidents in the case of midwives' practice. He says: "My informant admitted that a very large proportion of ruptured perineums occurred and were concealed. The midwife is obliged to call in a physician to undertake the repair, and very frequently (and naturally) ignores its existence, lest the rupture should be considered due to her want of skill. He hoped, however, as each succeeding class of midwives were better educated, and realised more the importance of the rupture, that this proportion would grow much less." But that is only a hope, and that hope, Dr. Drage was quite sure, would be illusory in this country. "Regarding the public attitude to the system, he thought that the sex generally preferred to be attended by women" (that is, the Austrians); "but he admitted that in the richer classes a physician was almost always present, although the midwife conducted the labour; and also that, year by year, the proportion of those who were adopting the English custom of being attended by a physician was becoming larger. With regard to 'man-midwifery' in the lower classes, he said that a man who had time to attend to that class of patient" (Dr. Drage presumed he meant here) "must be very hard up for work, and was much to be pitied. I may say that the English ladies here are, without exception, dead against the system, and complain bitterly of the extraordinary difficulty they have in getting a physician to consent to attend them. Attendance on such cases is considered *infra dignum*, even by a parochial medical officer—that is, in Austria. My informant, however, regretted that the custom prevented the young men from acquiring a real thorough experience of the difference between a normal and an abnormal case." That last statement brought the speaker to another point which he ought to

have mentioned before, on general educational grounds. He did not wish to boast about it, but when he left London he had had much more experience in midwifery than a great many other students; he had lived in the hospital a long time, and had had a large practice in the maternity department; but he could only assure the Committee that he was extremely glad to be able to have that large practice that could be got amongst the less rich people to improve his own knowledge and to keep up the experience he had already gained; and he thought it would have been a very great disaster to his own proficiency in the art if he had had to go into practice and wait for years and years before he had any run of midwifery work. Dr. Drage thought that poor women had a perfect right to have the best assistance attainable, and the profession did not object to legislation which would really benefit the poorer classes, but they did object to that which they knew would not benefit them in the slightest degree. He then proceeded to the consideration of the position of the Obstetrical Society in this matter. The result of polling the Society by a postcard on the subject showed that the Society as a whole was not in favour of the proposed legislation, although its council stated that it was. The British Gynecological Society by an overwhelming majority were against the proposal. Regarding the position of the British Medical Association, he stated that the opinion of the members had, in fact, never been taken. He then proceeded to point out that a large number of certificated midwives were in existence at the present time, and he asked why they did not minister to the wants of the population. In the Union of the rural sanitary district of Hatfield during the last six years the average number of births had been 192 and the puerperal mortality 5 per 1162 births; the number of cases yearly attended by a medical man exceeded 160. It was impossible to base the plea for legislation upon statistics, and he took exception to Dr. Aveling's statistics of mortality in maternity cases and to his conclusions generally in favour of certificated midwives. One reason why women would not give up their present ideas about attendance was that at the lying-in period they required someone who would nurse them and look after their household as well. The result of the establishment of a licensed class of midwives would be interference with the licensing of medical students. At present there was no disinclination on the part of women to be attended by students. Among the reasons which had led to the present demand for legislation he mentioned that an artificial stimulus had been given to the employment of midwives, and also that the doctors who were attached to the training schools for midwives naturally desired legislation in their favour. They formed the fallacious idea that all outside practice was bad and attended by a high rate of mortality. And, finally, there was the idle sensational talk encouraged at tea tables on the subject of the attendance upon the poor.

Dr. LOMBE ATHILL was the next witness called, and had been deputed by the Irish branches of the British Medical Association to give evidence. While objecting to registration, he desired to see women educated. There appeared to be an idea that registration would bring about education and render efficient the class of midwives that would appear on the roll hereafter. He objected to registration because if an official register were in existence it required to be purged from time to time; and with his experience on the General Medical Council with regard to medical men that was a most troublesome and costly matter. Continuing his evidence, he said "no registration would prevent the practice of unqualified women. The Medical Registration Act had not diminished the number of unqualified practitioners in the least, and if a Registration Bill for midwives were passed to-morrow and registered any number you like, from 500 to 50,000, you would still have uneducated women practising as midwives, because necessarily they can be obtained cheaper." Medical experts must be paid proportionately. Registered women are to be allowed to attend natural labour. If the midwife takes a case that is not natural labour and the patient dies, there is an inquest, and she is suspected of malpractice. County councils would not be fit bodies to investigate such cases. He continued: "Registration does you no good. Registration is only of use so far as to prove that the person is on the Register, and even that is not necessarily correct; a death vacancy may occur, or a man may fail to register. I would further point out that registration does not preclude you from practising. It is not proposed to give these women the power of signing certificates. And actually you gain nothing by registration. But education is good, and I advocate education while I disprove of registration. If registration is ever to be brought into force I contend that it should not be for ten years, until a system of education has been carried out. If it is essential that a woman in a hospital should not be licensed to be a nurse, although she is in a ward under the constant supervision of the sister and with medical men over her, with not less than twelve months' training, how is it possible that three months should be sufficient to qualify in midwifery? I have trained many hundreds of midwives and examined them, but I have been very much surprised myself, after taking the greatest pains week after week in instructing these women, at the confusion of their minds at the end of that time as regards what I may call the rudiments of midwifery. Remember you are going to take illiterate women—women, I mean, from the class of servants probably; you will not get ladies to go into midwifery practice to any extent in the country, it is too irksome; you will have to take women very much of the class of upper servants; you know what their style of reading and writing is. You begin to teach them anatomical names—the pelvis, the uterus &c.—and they do not get these names into their heads in three months. Yet it is proposed to register these women and to send them out into the country in three months. It ought to be three years. The very minimum should be six months. If you pass a Bill at all I would urge on you to see that you make education and not registration the chief thing. And I will say I would sooner be attended by, if I were a woman, or would sooner place my wife or daughter under the hands of an absolutely ignorant woman than under the hands of one who has a small smattering of knowledge. The accidents I have known have come more from the one class than the other. I believe there is more harm done by the maleducation of the medical student than there is by the practice of absolutely illiterate women, for the ill-educated student will do things which an illiterate woman will not do."

Dr. T. ERNEST HAYWARD was the next witness. He had been for twelve years in practice at Haydock, Lancashire, of which urban sanitary district he was also medical officer of health. The evidence which he would offer to the Committee would consist chiefly of facts within his own knowledge relating to the extent to which, in the part of Lancashire known to him, midwifery was being

practised by untrained and ignorant women, and the dangers to mothers and infants arising in consequence. The population of Haydock was 6535. The number of births for the past three years averaged 250 per annum. Of these scarcely a fifth, witness believed, were seen at any stage by a medical man. Most of the cases were attended by ignorant old women, and a doctor was only sent for in case of danger, often too late. Witness also quoted from the annual report of the medical officer of health of the neighbouring county borough of St. Helens, the population of which is over 70,000, the following, occurring in a paragraph relating to puerperal fever: "The great majority of accouchements in St. Helens are attended by midwives, a large number of whom have no other qualification than that of being mothers themselves." To illustrate the appalling results which often occur for want of the most elementary knowledge on the part of these women, witness gave, out of a large number which he had become acquainted with in his experience, brief outlines of three cases. The first, a multipara, died of post-partum hemorrhage. She had been left by the midwife without her even finding out that anything was wrong. Again, a multipara died of rupture of uterus. The head had been impacted for many hours, help not being sent for until two hours after rupture had occurred. The third instance was the case of a primipara who died of puerperal septicæmia. It was afterwards found that the midwife had attended her while suffering from erysipelas of the finger. Having stated these facts, the only opinion which witness could venture to express to the Committee was that some action was called for from the Legislature to remedy the existing state of things. Witness believed also that it would not be to the disadvantage of the medical profession for there to exist a class of properly trained and certificated midwives.

Mr. FRANCIS ROWLAND HUMPHREYS showed, from statistics obtained through the medium of the Midwives' Institute and Living-in Charity of Guy's Hospital, that where properly trained midwives were employed the percentage of mortality was very low. He thought that midwives who were trained to pass the Obstetrical Society's examination were well qualified. He advised, however, the supervision of midwives after the three months' training for as long a period as possible. The witness contended further that midwives should not attend cases of miscarriage, but only cases of natural labour at full time. In his opinion it was desirable that all midwives at present in practice should be placed on the Register on producing satisfactory evidence of fitness for their calling. He submitted a paper to the Committee showing what was required by the Obstetrical Society in the ordinary course of their examination, and expressed the view that a knowledge of medicine and surgery would be of little use to midwives, as they would gradually lose it on account of lack of opportunity of applying their knowledge. As far as midwives were concerned, the pulse was the only thing that was of much use to them.

Mrs. MALLESON, Hon. Sec. to the Rural District Branch of Queen Victoria's Jubilee Institute for Nurses, stated that her interest in the subject before the Committee was unprofessional, and arose from observation of untrained midwifery in a remote rural district during ten years. It was at first difficult for her, as for other interested observers of village life, to realise that the poor country women were, as a rule, attended in childbirth by wholly untrained midwives, doctors being called in only in cases of difficulty or danger. The class of women who had the hardihood to take this attendance upon themselves were quite illiterate and ignorant, eking out a livelihood by work in the fields and other rough occupations. They were incapable of discriminating between normal and abnormal labour, often sending for the assistance of medical men either needlessly or too late. They had no knowledge of what should be done in the slightest emergency, and no resource. They were ignorant of the most elementary principles of nursing, of the sanitary keeping of a patient's room, and it was scarcely necessary to add, completely without experience of the modern methods of treating lying-in patients. It was, she said, no uncommon thing for them to allow their patients to be delivered on the floor, and it was customary to give spirits to women in and after labour. They did not unite the offices of monthly nurse and midwife, as trained midwives often did, and very commonly allowed the poor mother to be downstairs on the third day after her confinement. They were without any knowledge of the proper treatment or feeding of infants and were incapable therefore of counselling mothers in the care of their children. The consequence was an amount of suffering and want of healthy development in children alarming to any who counted the results to the next generation. As it was impossible for poor men earning the average agricultural wages to pay the ordinary doctor's fee of one guinea, it was clear that there must be improvement in the class of midwives if the evils mentioned were to be abated.

Dr. W. GRAYLY HEWITT stated that there were about 10,000 midwives in England, and that about three-fourths of the labours in England were attended by midwives. In many villages the percentage of cases attended by midwives amounted to 90. He expressed the opinion that the evil of the incompetency of midwives was serious enough to require legislative interference, and urged the utility of registration as a means of enforcing the proper education of midwives. He agreed, however, that if all the midwives now in practice were put upon the Register there would be a danger of a practically unqualified woman being considered as good as a really experienced midwife. He gave an account of the mode in which the practical teaching of midwifery was conducted at University College Hospital, and stated that the pupils were never allowed to undertake a case alone until they had seen three or four cases. He suggested that the Medical Council might employ the Obstetrical Society for the examination of midwives, while the duty of removing the names of persons from the Register might be handed over to the local bodies.

Dr. W. S. PLAYFAIR stated that when the Obstetrical Society started their examination in the year 1872 he had a great deal to do with its organisation. He gave evidence to the effect that the council of the Society started the examination because of the complaints of the evil effects resulting from the ignorance and incapacity of a large number of the midwives then practising in the country. He agreed with the view that objection to the education and qualification of women as midwives proceeded from a very small section of the medical profession. Few of them had any objection to these, but the question of the registration of midwives was a different thing. He believed that something like 15,000 or 16,000 women were practising as midwives at the present day. The number who were educated was very small, but the figures he had given included them. This led him to speak of the necessity of a more direct system of training, of examination, and of registration, in order to bring about an improvement among midwives.

Mrs. ZEPHERINA P. SMITH, the President of the Midwives' Institute, stated that a properly trained midwife could diagnose danger before it was actually present in a confinement case. Her opinion was that the training now given to midwives in most schools was satisfactory. There was a disinclination among the members of the Midwives' Institute to oppose any legislation that would protect poor women from incompetent midwives. She suggested two classes on the Register, one consisting of the midwives now in practice, and one for those registered after examination.

Dr. JAMES EDMUNDS advocated a State examination for women in midwifery and the auxiliary branches of medicine. Women who have passed such an examination should be registered by some provision appended to the Medical Acts, and in relation to the general practice of medicine they should occupy the position of educated specialists, analogous to that now occupied by dentists. The practice of midwifery should be severed as far as possible from attendance upon infectious cases, and from the duties of the post-mortem room. Much of the mortality now incident to childbirth arises from infection brought into the lying-in room by the general practitioner, and this factor in the mortality of childbirth might be got rid of almost entirely by the employment of specialist midwives. The professional knowledge and skill necessary for such women would be acquired in from twelve to eighteen months' steady work under proper scholastic and clinical provisions. Over one hundred ladies were educated upon this basis some years ago by the Female Medical Society, and those ladies have since done valuable work in various parts of the world. Four to six months' training under proper clinical surroundings might suffice for an obstetric nurse such as might be needed for isolated villages, but the registered midwife should have from twelve to eighteen months' thorough training. He would let such midwives get their professional knowledge anywhere and anyhow so that they passed an adequate examination, and the passing of such examination he would make the sole qualification for putting them upon the Register. He would have free trade all round in medical teaching. The women should be not of the servant class, but of the governess or Board School mistress grade. Their fees he would leave to be settled between them and their patients, precisely as is now done with medical men. Whether they took 5s. or 100 guineas would be no one else's business. In country districts the average area through which such a woman would practice would have a radius of about five miles round her home. She should deliver the patient, see her settled in bed, wash the baby before leaving, and give such directions as were necessary to the nurse or neighbour who looked after the patient. She should visit the patient again next day, then on the fourth and seventh days, and perhaps once more. If any intercurrent illness occurred she would turn the patient over to a medical man. Such women would be of great value in their districts, and they would make a much more comfortable living than they now do as governesses or Board School mistresses. They would easily earn £150 a year, and they would acquire much the social position of the village curate. He would make it a stipulation that they did not attend any infectious medical cases. He would encourage such women to fit themselves for all the emergencies of labour and to do operative midwifery if they felt able to do so. In many cases where there is an adherent placenta to be removed or a version to be performed a woman has a great advantage over a man in the small size of her hand, and she could safely intervene in such cases at an earlier period than a man could. The question of the mortality in childbirth among the existing class of midwives and among gentlemen practising midwifery as well as general practice was discussed by Dr. Edmunds in a letter to *The Times* of October, 1865. It appears that uneducated midwives have a smaller mortality among the patients than have the medical men. The reason he believed to be that infectious poisons are conveyed into the lying-in room by the general practitioner, and he thought that casualty is practically unavoidable under the conditions in which general practice has to be pursued in connexion with the practice of midwifery. The education and registration of midwives would not in the least injure the vested interests of existing medical men. All that would occur would be the gradual infusion into the professional recruits of a certain proportion of registered midwives. In many cases such women would be the sisters of the men who now go into general practice—such women as now devote themselves to skilled nursing.

Mrs. MARY SCHARLIEB, M.D., spoke of the necessity of the registration of midwives in order to protect mothers in the poorer classes from the serious consequences of the carelessness, ignorance and negligence of unqualified women. High-class Mahomedan and Hindoo ladies were never attended by men in their confinements. She explained that after an expensive education it would not pay lady doctors to take midwifery practice alone, but they would expect the midwives to call them in, as medical men were called in, in case of difficulty. She approved of the term "licensed midwife" being used, provided that it was duly published and recognised. She stated that in her view any Registration Act should be prospective, the date for its coming into force being postponed for such a time as would enable existing midwives to qualify.

Dr. CHAMPNEYS had no doubt that the registration of midwives was highly desirable. From time to time instances of gross malpractice occurred, displaying ignorance which could not exist in any trained midwife. As regarded the duration of training, more prolonged training would certainly be better, but most of the pupil midwives at the hospitals were too poor to be able to afford it, and the hospitals were too poor to reduce their fees. The training of a midwife was intended to be strictly limited, but within those limits thorough. She was expected to possess a good knowledge of antiseptics and of the treatment of emergencies till the doctor arrived. She was not expected to practise as a doctor. There ought to be a power of depriving a midwife of her diploma for any such encroachment. An advertisement or notice to the effect that Mrs. So-and-so is at home to see patients between certain hours ought, in his opinion, to be considered such an offence. As regarded the effect of the spread of qualified and registered midwives over the country on the practice of medical men, he had had contradictory opinions given him by country doctors. To some it would be the greatest relief to be deprived of poor midwifery practice; others feared a reduction of their fees and others a reduction of their experience. He believed that the doctors of a country district would not generally lose money if they all worked together, for they would probably be able to get far better fees for consultation cases which midwives would not be able to deal with. In his opinion also a doctor who attended a large amount of poor midwifery was rarely in any good sense experienced, for the wear-

and-tear was such that he could not think about his cases. He likewise considered that the public might justly prefer a midwife properly trained in antiseptics to an overworked medical man. The great test was the good of the community, and this was the only true claim of the medical profession to existence at all.

Dr. DANFORD THOMAS gave his experience. He had been in practice fifteen years, and had been one of the coroners for London for eleven years. His experience was that there were three classes of midwives—a small and useful class, who held a certificate; an uncertified class, obtaining knowledge simply from their practice; and an utterly ignorant class, consisting chiefly of old women. The poor were unable to discriminate between the educated and the uneducated class. He said: "I have held inquests in half-a-dozen cases which come to my recollection during the last ten years, in which either the death of the woman or the child has resulted from the ignorance of the midwife. In one case, although she was warned by a neighbour of the danger the patient was in, the midwife protested that everything was all right and would be all right presently, using the favourite expression, 'Let her alone, she will do well,' simply because she had no knowledge that it was a case of what is called 'placenta previa.' The woman bled to death. She refused to have a doctor, and the husband agreed with her, as he had great confidence in her statement that no doctor was required. An educated midwife would have recognised the condition and would have sought medical aid. I may say that the more educated the midwife is the more quickly and the more frequently does she seek medical aid when it is wanted. She recognises the danger and gets the assistance that is necessary. The uneducated woman will let the patient go on to the very last. Jealous of her supposed knowledge, and not wishing the relatives to know that she does not understand the case, she goes on to the last, and sometimes the woman dies and sometimes also the child. I have had cases where an infant has bled to death from the very incompetency of the so-called midwife even to tie the cord properly. I therefore think that if there were first of all the proper training of midwives and the examination with registration it would be a great advantage to the community; that the medical profession would have nothing to fear in any shape or form from these ladies, as they would be extremely limited in number under any circumstances." He concluded that the registration of midwives would be a great advantage to the community in general. It was immaterial to him whether the terms "registered," "licensed," "certificated," or "chartered" were used, provided that adopted indicated that the midwives were properly certificated by a central legal body. If a small fee were charged for registration he did not see what difficulties were in the way of keeping a register of midwives.

Mr. GEORGE BROWN gave evidence at the request of the Council of the General Practitioners' Alliance in opposition to the proposal to register midwives. He protested against ignorant and partially-educated women being recognised by law as competent to practise midwifery. He insisted that no one who had not a complete education in medicine and surgery as well as in obstetrics was qualified for such practice. To legalise registration diplomas would be, in Mr. Brown's opinion, to undo all the effect of the Medical Act of 1856, as it was impossible to determine where natural labour ended and abnormal labour began. He objected to registered midwives being allowed to administer drugs to their patients, and he stated his belief that if midwives were registered an agitation which could not be legally resisted would immediately spring up for the registration of men, a proceeding which would be the death-blow to all Acts of Parliament regulating the practice of medicine.

Dr. W. H. FENTON urged the expediency of midwives being registered in order that they might be improved and controlled.

Dr. HUGH WOODS said that many doctors objected very strongly to the legal registration of midwives, while having no objection to the highest training, or even registration, of monthly nurses. He said that midwives were a relic of the Dark Ages, and that until the sixteenth century, so long as midwifery was in the hands of women exclusively, no advance was made in the art. He considered that the proposed registration of midwives aimed at preventing the natural and desirable extinction of that class. He maintained that a very large part of the mortality of childbirth occurred in the so-called normal cases, and quoted the opinion of Dr. Engelmann of St. Louis from "A System of Gynecology and Obstetrics by American Authors," to the effect that one of the great causes of the extreme mortality in parturition in the older countries is the persistence of the prejudice that normal labours can be sufficiently well attended by midwives. He cordially agreed with that opinion, and discouraged the idea that normal labour does not require the most skilled treatment. He argued that it would be impracticable to prevent others than registered midwives from giving help to women in confinement, and that unless this was done the mere conferring a monopoly of the title "midwife" on certain persons could have no value. He remarked that as all *bona-fide* midwives would be put on the Register at the commencement, it would include for many years many drunken and disreputable women; while so soon as it ceased to contain any but highly trained women, the payment required by them would put them out of the reach of the very people for whom they were apparently intended. They would, he thought, compete directly with doctors for attendance on the lower middle classes. He insisted that every confinement ought to be attended by a fully-qualified doctor, male or female. He felt that it would be a great anomaly for a woman with three months' training to be registered as qualified and entitled to recover fees for what is certainly about the most difficult part of medical work—namely, attendance on confinements; while an F.R.C.S. is not legally qualified to tie up a cut finger without being also qualified in the other branches of the profession. The mortality in childbirth, he said, never fell much below 1 or 2 per cent., so that it could not be looked upon as a mere physiological act; for physiological acts such as eating &c. did not involve death once in two hundred times. He said, finally, that what he and other doctors objected to was the giving to women a legal qualification to practise as doctors under the name of midwives. In reply to questions from members of the Select Committee, Dr. Woods said he thought certificated nurses did already distinctly act as doctors under cover of their certificates as nurses. He entirely disbelieved the statistics, which professed to show that a greater percentage of deaths occurred under the care of doctors than of trained midwives. Cases usually passed into the hands of doctors when death became imminent, and so went to their credit. He considered that

legal registration would be giving a guarantee of competency where competency was non-existent. His experience was that midwives did not, even when well trained, recognise the signs of impending danger. He thought that the practice of midwives without the help of doctors might be checked by coroners reprimanding them for undertaking sole management in cases where death occurred. He felt sure that any certificates of the competency of midwives before putting them on the Register would be useless as a safeguard, and said that medical men would decline the responsibility and odium of deciding as to the merits of women with the talent of the fair sex for damaging character. He thought the employment of midwives would die out gradually if they were let alone. He said that ladies preferred men to attend them, and he saw no objection to it. He said that if midwives had so enormously less a mortality, as was contended, than medical men, the latter must be dangerous animals who ought not to be employed. He thought doctors very seldom conveyed infectious diseases to their patients. As regarded the actual general mortality in childbirth, he thought a  $\frac{1}{2}$  to 1 per cent. was a pretty fair estimate. He found that poor women got over their confinements very well when attended by a doctor with mother or other relative as nurse.

The following is the report which the Committee have agreed upon, and of which we have already published the main points:—

"Your Committee have sat six times and have taken most valuable and important evidence from medical men and practitioners in various spheres of practice both in favour of and opposed to the registration of midwives, and also from trained and experienced midwives. This evidence has shown that there is at present serious and unnecessary loss of life and health and permanent injury to both mother and child in the treatment of childbirth, and that some legislative provision for improvement and regulation is desirable. They have also had evidence showing that there is a wide field for training in midwifery now unused connected with parish infirmaries and home practice in populous places. Their inquiries have been cut short by the approaching early dissolution of Parliament, and they therefore report the evidence and recommend a continuation of the inquiry in the next session of Parliament."

## VITAL STATISTICS.

### HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 6100 births and 3878 deaths were registered during the week ending Sept. 3rd. The annual rate of mortality in these towns, which had been 18.0 and 18.5 per 1000 in the preceding two weeks, further rose last week to 19.8. In London the rate did not exceed 16.6 per 1000, while in the thirty-two provincial towns it averaged 22.2 per 1000. The lowest rates in these towns were 11.8 in Halifax, 13.6 in Nottingham, 14.5 in Bradford and 15.0 in Burnley; the highest rates were 26.1 in Leeds, 28.6 in Sheffield, 31.8 in Bolton, 33.7 in Salford and 37.8 in Preston. The 3878 deaths included 984 which were referred to the principal zymotic diseases, against 678 and 830 in the preceding two weeks; of these, 728 resulted from diarrhoea, 72 from measles, 62 from scarlet fever, 54 from diphtheria, 44 from whooping-cough, 23 from "fever" (principally enteric) and one from small-pox. The lowest death-rates from these diseases were recorded in Halifax, Derby, Bristol and Swansea, and the highest rates in Sheffield, Leeds, Salford, Bolton and Preston. Measles caused the highest proportional fatality in Salford, Huddersfield, Brighton and Oldham; scarlet fever in Preston and Swansea; whooping-cough in Nottingham and Preston; "fever" in Portsmouth and Birkenhead; and diarrhoea in Gateshead, Hull, Leicester, Cardiff, Sheffield, Salford, Leeds, Bolton and Preston. The 54 deaths from diphtheria included 34 in London, 4 in Salford, 3 in Manchester and 3 in Oldham. One fatal case of small-pox was recorded in Halifax, but not one in London or in any other of the thirty-three large towns. Five cases of this disease were under treatment in the Metropolitan Asylum Hospitals and 3 in the Highgate Small-pox Hospital on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 3280, against 3088, 3052 and 3103 on the preceding three Saturdays; 461 new cases were admitted during the week, against 367 in each of the previous two weeks. The deaths referred to diseases of the respiratory organs in London, which had been 139 and 148 in the preceding two weeks, declined again to 114 last week, and were 55 below the corrected average. The causes of 72, or 1.9 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Bolton, Oldham, Bradford, Hull and in seven other smaller towns; the largest proportions of uncertified deaths were registered in Swansea, Birmingham, Liverpool, and Sheffield.

## HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 17.2 and 16.2 per 1000 in the preceding two weeks, further declined to 15.7 during the week ending Sept. 3rd, and was 4.1 per 1000 below the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 12.7 in Dundee and 14.3 in Edinburgh to 17.0 in Glasgow and 20.6 in Perth. The 438 deaths in these towns included 26 which were referred to diarrhoea, 14 to scarlet fever, 10 to whooping-cough, 9 to measles, 4 to diphtheria, 4 to "fever," and not one to small-pox. In all, 67 deaths resulted from these principal zymotic diseases, against 81 and 75 in the preceding two weeks. These 67 deaths were equal to an annual rate of 2.4 per 1000, which was 2.6 below the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of diarrhoea, which had been 27 and 34 in the preceding two weeks, declined again last week to 26, of which 16 occurred in Glasgow and 5 in Edinburgh. The deaths referred to scarlet fever, which had been 14 and 10 in the previous two weeks, rose again to 14 last week and included 9 in Glasgow and 2 in Leith. The 9 fatal cases of whooping-cough were within 1 of the number in the preceding week, and included 9 in Glasgow. The deaths from measles, which had declined in the preceding four weeks from 23 to 12, further fell to 9 last week, of which 7 occurred in Glasgow and 2 in Edinburgh. The 4 fatal cases of diphtheria and the 4 of "fever" corresponded with the numbers recorded in the preceding week. The deaths referred to diseases of the respiratory organs in these towns, which had been 76 and 57 in the preceding two weeks, were again 57 last week, and were 25 below the number in the corresponding week of last year. The causes of 39, or nearly 9 per cent., of the deaths in these eight towns last week were not certified.

## HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 19.5 and 24.0 per 1000 in the preceding two weeks, further rose to 26.3 during the week ending Sept. 3rd. During the first nine weeks of the current quarter the death-rate in the city averaged 23.0 per 1000 against 17.6 in London and 16.1 in Edinburgh. The 176 deaths in Dublin during the week under notice showed an increase of 15 upon the number in the preceding week, and included 19 which were referred to diarrhoea, 2 to scarlet fever, 2 to diphtheria, 2 to "fever," 1 to measles, and not one either to small-pox or whooping-cough. In all, 26 deaths resulted from these principal zymotic diseases, equal to an annual rate of 3.9 per 1000, the zymotic death-rate during the same period being 3.3 in London and 1.8 in Edinburgh. The fatal cases of diarrhoea, which had been 12 and 9 in the preceding two weeks, rose again to 19 during the week under notice. The deaths referred to different forms of "fever," which had been 2 in each of the preceding two weeks, were again 2 last week. The 2 fatal cases of scarlet fever and the 2 deaths from diphtheria exceeded the numbers in any recent week. The deaths referred to measles, which had steadily declined in the previous five weeks from 8 to 2, further fell to one last week, a lower number than in any week since February last. The 176 deaths registered in Dublin last week included 42 of infants under one year of age and 35 of persons aged upwards of sixty years; the deaths of infants showed a slight further increase, while those of elderly persons corresponded with the number in the preceding week. Six inquest cases and 6 deaths from violence were registered; and 56, or nearly a third, of the deaths occurred in public institutions. The causes of 24, or nearly 14 per cent., of the deaths in the city last week were not certified.

## THE SERVICES.

## MISS FLORENCE NIGHTINGALE AND INDIAN SANITATION.

Miss Florence Nightingale forwarded a letter to the late Secretary of State for India regarding the improvement of village sanitation in order to see whether something could not be done to overcome the financial difficulties connected with practical sanitary work in villages. It will be remembered that the subject of village sanitation in India occupied the attention of that section of the International Congress of Hygiene and Demography, and Miss Nightingale took it up in

connexion with the representations of the Congress and the Bombay Sanitation Act of 1889. There is no doubt that reasonable sanitation is one of the first necessities of village life, but the poverty of the people and their religious and social prejudices are great obstacles to success. However, Miss Nightingale's letter with its enclosures has been forwarded for the consideration of the Governments of India and Bombay.

## THE SOLDIER'S RATION.

We recently called attention to the revised edition of instructions on the messing of soldiers, showing how the Government ration, supplemented by the messing allowance deducted from the soldier's pay, could be turned to the best account. Satisfactory results were attained in the case of the 1st Battalion of the Northamptonshire Regiment and in that of three companies of Mounted Infantry encamped at Bourley. The experience so far obtained indicates that a better and more attractive food can be provided for the soldier at home stations than has heretofore been the case. The revised edition of the instructions on the messing of soldiers was issued to the troops at Aldershot under the direction of Sir Evelyn Wood, the general officer commanding.

## SOLDIERS' BOOTS.

It will be remembered that a short time ago a French army surgeon, Dr. Alex. Colin, published the results of his investigations into the effects of marching upon soldiers in disciplined bodies and the prejudicial effects of the regular repetition of an indefinite number of small shocks on the body, for which the provision of an indiarubber heel for military boots was suggested. It is stated that this heel has been tested by several infantry regiments with satisfactory results. The comfortable and efficient shoeing of the soldier is unquestionably a very important item with regard to his efficiency at all times, especially on field service.

## ARMY MEDICAL SERVICE.

Surgeon-Captain J. Will, lately returned from Hong Kong, has been ordered to Edinburgh for duty on the North British District Staff.

## MOVEMENTS OF THE MEDICAL STAFF.

Surgeon-Colonel Godwin, late Professor of Military Surgery at Netley, proceeds to India on a tour of Foreign Service. Surgeon-Colonel Welsh has been ordered from Cork to the Western District as Principal Medical Officer. Surgeon-Captain Allport is on leave of absence pending embarkation for India. Surgeon-Captain Hickson has proceeded from Dublin to Templemore; Surgeon-Captain Nicolls from Omagh to Enniskillen. Surgeon-Captain Hanley embarked for India on the 2nd inst. Surgeon-Captain Firth has been ordered from Dover to Netley for duty. Surgeon-Major Lamprey has joined at Hounslow for temporary duty.

## ARMY MEDICAL RESERVE OF OFFICERS.

Surgeon-Lieutenant Henry Darvill Brook, 20th Middlesex (Artists) Rifle Volunteers, to be Surgeon-Lieutenant (dated Aug. 31st, 1892).

## NAVAL MEDICAL SERVICE.

The following appointments have been made:—Fleet Surgeons: Anthony Gorham, M.D., to the *Wildfire*, additional, and George Kell to the *Rodney* (both dated Sept. 1st, 1892). In accordance with the provisions of Her Majesty's Order in Council of April 1st, 1881, Surgeon William Henry O'Meara has been placed on the Retired List of his rank (dated June 13th, 1892). Staff Surgeons: Samuel W. Vasey to the *Nelson* and William Tait, M.B., to the *Cleopatra* (both dated Sept. 14th, 1892). Surgeons: John L. Thomas to the *Invincible* and John E. Webb to the *Victoria*, additional, (both dated Sept. 6th, 1892).

## VOLUNTEER CORPS.

*Artillery*: 2nd Devonshire (Western Division Royal Artillery): Surgeon-Lieutenant A. K. Crossfield to be Surgeon-Captain (dated Aug. 27th, 1892).—1st Durham (Western Division Royal Artillery): Surgeon-Lieutenant J. W. Beattie, M.B., to be Surgeon-Captain (dated Aug. 27th, 1892).—*Rifle*: 2nd Volunteer Battalion, the Royal Welsh Fusiliers: Thos. Louis Kenrick Davies, M.B., to be Surgeon-Lieutenant (dated Aug. 27th, 1892).—3rd Volunteer Battalion, the Queen's Own (Royal West Kent Regiment): Surgeon-Lieutenant A. A. Kantiack resigns his commission (dated Aug. 27th, 1892).—4th Volunteer Battalion, the Gordon Highlanders: Jas. Nicol, M.B., to be Surgeon-Lieutenant (dated Sept. 3rd, 1892).

"Audi alteram partem."

### 'THE LANCET COMMISSION ON SANITATION IN RELATION TO THE LAW AND PRACTICE OF HOUSE-LETTING.'

To the Editors of THE LANCET.

SIRS,—As the originator of the Eastbourne scheme of Sanitary House Registration, and chairman of the committee which has carried it out, I venture to reply to your correspondents. Until seeing Mr. Penford's letter I thought that we were the only authority which issued sanitary certificates; I shall be very willing to exchange notes with him, as we should each probably profit by the experience of the other. I can easily give Dr. Blake the statistics he asks for, though I fear they would not help anyone wishing to take a particular house. We have been issuing certificates for two years and a half, and the demand for them has constantly increased. Our standard of excellence is as high as modern sanitation enables us to make it, and in a later communication I can give a full description of the scheme, which I think will satisfy him that all certified houses are as sound as the most exacting tenant can wish. The services of the officials are given gratuitously; they advise upon the work necessary, and it is executed under their constant inspection; a fee, however, is charged to non-ratepayers who may require a reinspection.

In conclusion, I may add that I have never seen Dr. Farquharson's Bill, that I drafted the scheme entirely on my own ideas, and am therefore more responsible for its defects than anyone else.

I am, Sirs, yours faithfully,  
ARTHUR P. SHERWOOD, M.D., L.R.C.P.,  
Chairman of Sanitary Committee, Eastbourne  
Corporation.

Aug. 30th, 1892.

### SUB-PERITONEAL HYSTERECTOMY.

To the Editors of THE LANCET.

SIRS,—I see from your report of the proceedings of the Obstetrical Section at Nottingham that the sub-peritoneal method of treating the uterine stump was once more brought forward and discarded with the damning praise of "ideally the best." History repeats itself. The surgeons of the sixteenth century, who looked upon hot pitch as a necessity, undoubtedly used the same expression when Ambrose Paré (having previously ligatured his arteries) advocated the closure of amputation flaps. "Ideally the best," they said; "but having pitched our stumps we must go on in the open." The use of the *serre-neud* in hysterectomy has been referred to as a relic of barbarism. I think, however, the term might be much more justly applied to the use of the elastic tourniquet. To the extra-peritonealists (and I am sorry, for the sake of our method, that under this head come nearly all the leaders of abdominal surgery in England)—to the extra-peritonealists, I say, my expression will seem exaggerated, perhaps foolish, but to my mind the use of the elastic ligature to the tender uterine stump is as barbarous as was the use of hot pitch by our ancestors.

To return to the operation. What are the special dangers generally credited to the sub-peritoneal method? Two: secondary hæmorrhage and sepsis. Why is there secondary hæmorrhage? "Because," say the extra-peritonealists, "of the contractions and rapid diminution in size of the ligatured stump." Ask the obstetricians, on the other hand, why secondary hæmorrhage is almost unknown after confinement, and they will tell you that it is on account of the contraction and rapid diminution in size of the empty uterus. "Quite so," say the extra-peritonealists; "but the fact remains that hæmorrhage does occur after sub-peritoneal hysterectomy, and not unfrequently." Granted, but the cause is not far to seek; your hæmorrhage proceeds from your ligature. Any fair surgical treatment—be it even total extirpation—the uterus will tolerate, but to be crushed for twenty to forty minutes in an elastic ligature is beyond even its powers of endurance. As a result of this unnecessary treatment, the stump is left deprived both of its nervous and muscular power, bruised and helpless. Under such circumstances it is a wonder that secondary hæmorrhage does not occur after every operation. Even in the amputation

of an extremity, protected as the nerves and muscles are by thick skin and subcutaneous tissue, the use of an elastic ligature is apt to be followed by oozing; how much more then in the uterus, whose sole protection is the filmy peritoneum? It has been claimed for the elastic ligature that it gives confidence to the operator. Let the operator who requires it use it, but I venture to think that Mr. Knowsley Thornton and Mr. Lawson Tait have got beyond the stage of requiring a wall to their backs. Further, the danger against which it is supposed to guard does not exist. When once the broad ligament is tied off, and any superficial and evident vessels clipped, there is in cutting through the uterine tissue no more hæmorrhage—nay, there is much less—than in cutting through the tongue in Whitehead's operation; and as for the tongue so for the uterus, scissors are by far the best. In my earlier operations I looked for and found the uterine arteries; I now cut through the uterus at once and catch the arteries as they spout. The second danger credited to the operation is sepsis. And wherefrom sepsis? "From the exposed uterine mucous membrane," say the extra-peritonealists. The healthy appetite of the peritoneum, if properly treated, is capable of dealing with much more septic material than exists on the fragment of mucous membrane left behind. And if the operator wishes for greater security, let him cut out, burn, sterilise, or otherwise destroy his *bête noire*. "But," reply the extra-peritonealists (*minus* Mr. Tait, I hope), "although your arguments are plausible, sepsis does occur." Of course it does occur, and will occur so long as a ligature is used and a uterus and peritoneum bruised and enervated are left behind. Under such conditions it is only to be expected that in the struggle between peritoneum and septic material the former will have a greatly diminished chance.

In short, the two dangers credited to the sub-peritoneal method, secondary hæmorrhage and sepsis are due entirely to the use of the elastic ligature. If our leaders will give a trial to hysterectomy without the ligature I am certain that the skill and facility of resource which are their great characteristics will enable them to cope with any hæmorrhage, and once the ligature is abandoned the sub-peritoneal operation will become not only the "ideally" but the "really" best.

I apologise for again trespassing on your valuable space and for the discursiveness and lack of gravity of my letter; my excuse must be that to us at a distance the columns of THE LANCET take, as a means of communication with the bulk of the profession, the place of the learned societies.

I am, Sirs, your obedient servant,

Cairo, Aug. 21st, 1892.

H. M. MILTON.

### BICYCLE ACCIDENTS.

To the Editors of THE LANCET.

SIRS,—In your second article on "Cycling and Vitality" you say, referring to accidents: "These increase daily, not from faults of the machines ridden—for, thanks to the skill, care and competency of the industry that turns out cycles there is the most admirable safety work in this direction that was ever produced—but from the faults of the riders themselves." It is desirable it should be recognised that by far the commonest single cause of the increased number of accidents—an increase altogether out of proportion to that of the votaries of cycling—is the more general adoption of the pneumatic tyre, the tendency of which to skid on wet ground is notorious, great as are the advantages which outweigh this fault. The surface of most roads slopes to the sides, so that in passing or overtaking another vehicle one rides along a sloping plane. In such a position the rear-driven safety tends to swerve, so that the driving-wheel slips down hill. To combat this the rider steers somewhat up and so further reduces the angle of pressure on the ground. Skidding of the steering wheel does not matter much, but slight slipping of the back wheel causes a fall. In many accidents of late the rider has been actually thrown against or under the met vehicle, for he *must* fall towards it. Cyclists unaccustomed to the pneumatic tyre do not recognise the necessity of allowing the machine gradually to approach the kerb and of not trying to correct the leeway when the ground is greasy, rather than run the risk of a skid. On a clear road a fall will teach caution, but if a heavy waggonette or dray be passing, the unfortunate cyclist may be deprived of an opportunity of profiting by experience.

I am, Sirs, yours faithfully,

Rainhill, Aug. 31st, 1892. W. F. MENZIES, M.D., M.R.C.P.

THE DENTAL PROFESSION AND THE  
GENERAL MEDICAL COUNCIL.*To the Editors of THE LANCET.*

SIRS,—I regret to have missed the correspondence in *THE LANCET* on dental advertising. If not too late, I should just like to say how very glad the better class of dentists would be if the General Medical Council could be prevailed upon to strike off the Dentists' Register the names of those who disgrace our profession by their advertisements in the daily press, on the walls, and by their exhibitions of artificial teeth in cases and windows. In the late Partridge trials one of the judges said: "If a barrister were to advertise his superior skill and lower fees he should have no hesitation in moving his Benchers to strike his name off the roll, as guilty of conduct disgraceful in a professional respect." The college from which Mr. Partridge held his diploma having withdrawn it for persistent advertising, the General Medical Council did strike his name off because he was only registered in right of that diploma. I hope the General Medical Council will further purge the Register in respect of those who are practising without diplomas, but who are simply registered as having been in practice before 1878, if they continue in conduct so professionally disgraceful. It would be a great help if the medical profession generally would urge this upon the British Dental Association and such members of the General Medical Council as they are able to influence. I am pleased, Sirs, that this question has been brought forward by a surgeon, because it gives one an opportunity of pointing out that it would be better if reputable medical men and surgeons would not lend their names to be placed in advertisements and circulars by advertising dentists; and if they could see their way to refuse to attend the surgeries of these unqualified advertisers to give anaesthetics it would be better. I have had two cases of actual fraud and extortion by advertising dentists under my notice just lately, which I have fully reported to the British Dental Association.

There is also the important question of "covering" by dentists as well as by medical men to be considered. If the General Medical Council would make this impossible, they would do great good to the public and also to the profession. It seems to me, Sirs, the General Medical Council is the "authority" your correspondent is in search of, and I am sure there are any number of dentists who will be only too glad to assist in moving that honourable body.

I am, Sirs, yours truly,  
HENRY BLANDY, L.D.S. Edin.

## THE COST OF MEDICAL EDUCATION.

*To the Editors of THE LANCET.*

SIRS,—As one who has obtained his education at at least half a dozen medical centres, and who has lived nearly twenty years in lodgings, my experiences as to expenses may prove interesting to some of your readers. I believe that the difference in this respect between the various centres is for the most part due to the standard of living adopted rather than to the price of rooms or provisions. Students brought up in thickly populated and highly civilised districts and seeking their education in London are obliged to live more expensively than the hardy sons of Caithness or Kerry farmers, for the simple reason that such diet &c. as would be quite sufficient for the latter would be slow starvation and physical declension to the former. I have lived a year of my student life in Cork at a total expense for board and lodging of about 8/- a week, and could have reduced even that sum had I chosen to share my rooms with another student. Even now I know of three students living in two rooms whose expenses seldom exceed 25/- a week (if we leave recreation out of account) but such living as this would be impossible to students reared more luxuriously. I have had two very tolerable rooms in an unfashionable suburb of London for 10/- a week, and have lived there in a room for which I paid only 4/- a week; my total expenses in the one case being about £1 and in the other 12/- a week. When in Edinburgh I lived much more expensively, but, had I chosen to do otherwise, I think I should have found the Scotch capital as cheap as most other towns. Cardiff is, or rather was when I was there, six or seven years ago, an extremely cheap town, especially as to rent, my two rooms there at 6/- a week being quite as good as any which I could get in London for 12/- or even 15/-. As to foreign schools

I shall not occupy your space with any lengthy remarks, but may say that even the larger capitals will be found moderately cheap to those who adopt the mode of living of the natives, and that in such a city as Munich a high standard of comfort can be maintained at an extremely small cost.

I am, Sirs, yours faithfully,  
SEPT. 6th, 1892. EXPERIENTIA DOCTUS.

THE CHAIR OF PATHOLOGY AT MCGILL  
UNIVERSITY.*To the Editors of THE LANCET.*

SIRS,—I see it stated in the last number of *THE LANCET* that I am a candidate for the Professorship of Pathology in the McGill University. I shall be glad if you will contradict this report, as I am not and never have been a candidate for that valuable post.

I am, Sirs, your obedient servant,  
Westminster, S.W., Sept. 7th, 1892. M. ARMAND RUFFER.

## BIRMINGHAM.

(FROM OUR OWN CORRESPONDENT.)

*The Rough Rampant.*

IN this as in most large centres of population every now and then passes a wave of ruffianism, an outbreak characterised by the exhibition of savage cruelty, brutal assaults and fiendish malevolence. On Saturday night last there were a succession of assaults and display of scoundrelism such as have not been witnessed for many years. Two deaths mark the epoch: one in which an inoffensive man was kicked to death; a second where a man, stabbed outside a public-house, has since succumbed to his injuries in the hospital. Assaults on police officers, wives, and even on children, fill the catalogue, and cause a shudder at the wild fierceness of uncontrolled passions which run riot in the midst of civilisation. Man's inhumanity to man finds little check from the moral influences of teaching and education. Example in many forms is better than precept. The stronger power of the law can only be retributive in these instances, but to deal leniently with acknowledged roughs whose lives are spent in assaulting, maiming and killing their fellow creatures, is a travesty upon the harm done to society and to the protection of inoffensive and orderly people.

*The Cholera Campaign.*

The threatened visitation of cholera has evoked the interest of many correspondents of the daily press and, as usual, has called forth the laudation of an infinite variety of specifics and panaceas. Fortunately the machinery of the health department in our city is in excellent working order and capable of acting with vigour and readiness on any emergency. So far no frights or scares have disturbed the equanimity of the nervous or the sensitive, and time is allowed to take stock of our sanitary position. After all, the simplest weapons are the safest to combat any approach of the dread disease. The precautions of prudence and cleanliness, added to drainage and ventilation, are in the power of all to wield. Measures which will yield the greatest amount of safety and success are generally ignored because of their simplicity. The Local Government Board, with our distinguished medical citizen as Secretary, will find ample proof of the assertion that sanitary science, like charity, begins at home.

*Contempt of Contagion.*

A flagrant instance of offence against sanitary laws was brought before the Handsworth magistrates on Aug. 26th. On July 27th an inspector appointed under the Contagious Diseases Act found the carcasses of five swine floating in the river Tame. These were certified as having died of swine fever. Further inquiry showed that sixteen other pigs had been secretly buried on the farm, a foot deep, without disinfectants. The owner of the pigs found this proceeding rather an expensive one. He was fined £2 10s. and costs with respect to each of the twenty-one cases, while the bailiff was fined £10 and costs. The sum of £80 is an expensive lesson, but it is necessary in the interests of other stock-

owners and of public health that such a violation of known laws should be adequately punished.

#### *Warding the Workhouse.*

The Revision Committee of the Birmingham Board of Guardians have just had a "call over" of the inmates. The number of paupers in the workhouse was: males, 539; females, 413. The venereal cases had been reduced considerably—namely, to three males and seven females. Children numbered 81, the total number being 1033. The ages were: under sixty, 8; between sixty and seventy, 183; between seventy and eighty, 180; between eighty and ninety, 25; over ninety, 3. One woman had been an inmate for fifty years. The inmates of the workhouse infirmary numbered 1237; there were 396 children at Marston Green Homes.

Sept. 6th.

## LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

#### *Death from Hydrophobia.*

AFTER a long immunity from hydrophobia, due, no doubt, to the stringency with which the muzzling order was carried out through the country, a case of hydrophobia recently occurred here and unfortunately ended fatally. The deceased was a foreman brakeman in the employ of the London and North-Western Railway Company at Preston, living at St. Helens. On June 25th last he returned home with his face bandaged and said he had been bitten by a dog; he was very weak and fell down on the sofa. He informed his wife that he saw a dog on the line at Preston the previous night, and as a train was approaching called it to him. The dog came up at first quietly and then suddenly flew at him, biting a piece out of his chin. He remained at home for three weeks and then, feeling quite recovered resumed work. All went well until Aug. 20th, when he complained of a feeling of suffocation, and was quite unable to drink some brandy which his wife brought him. Dr. Casey of St. Helens was called in, and seeing the serious nature of the case accompanied the patient to the Royal Infirmary, where he was admitted on the 21st, under the care of Dr. Bradshaw, and was seen by several other members of the honorary staff. The case, while resembling most cases of hydrophobia, had its peculiarities, and it is satisfactory to know that Dr. Bradshaw proposes to publish a full report of the case. Much sympathy was felt for the deceased, who lost his own life in trying to save that of the dog. He leaves a widow and several children to mourn him.

#### *The Importation of Cholera.*

Referring to the notice in THE LANCET of last week, p. 593, it is necessary to make one correction. Three of the cases were removed to the City Hospital at Parkhill; the fourth was inadvertently taken to the Liverpool Workhouse. It was, however, immediately diagnosed and promptly isolated. A second death took place in the Parkhill Hospital; the other cases are recovering. All four presented well-marked symptoms of true Asiatic cholera. No further cases have been reported, but the greatest vigilance is being exercised by all the local authorities. The weather here, moreover, has been such as to retard rather than favour the spread of the disease, and continues to be colder, with occasional showers.

#### *A Port Sanitary Medical Officer.*

The present outbreak of cholera will in all probability again raise a question which has been mooted before—viz., the appointment of a medical officer to the port. At present the medical officer of health for the city is also the port sanitary medical officer. It is obvious, however, that in such a city as Liverpool the duties of the medical officer of health must be sufficient to tax the powers of any one man, however energetic he may be, and that the medical duties attaching to a port such as this are of themselves amply sufficient for one person. The wonder is that such an appointment has not been made long ago. The fact is that the officers of the Customs have done their work so admirably that the medical officer has been promptly informed of any case requiring his attention. But the time has arrived when a change is desirable, and the present is a most favourable opportunity for effecting it.

Liverpool, Sept. 6th.

## NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

#### *Sanitary Matters in the North of England.*

UP to Sunday last our three principal ports were declared free from imported cholera, and I do not think that our sanitary authorities, so far, have encountered any other form of the disease. A break, however, has been made in this satisfactory state of things by the arrival in the Tyne late on Sunday evening last of the steamer *Elbe* on her way from Hamburg to Oporto, and the captain reported that the mate was so seriously ill from cholera that he had to put into the port for medical aid. Dr. Armstrong and Mr. Clark attended to the man, and he was removed to the Jarrow Floating Hospital, where he died early on Monday morning. Dr. Armstrong remained with him all night.

#### *Arsenical Poisoning.*

A case of poisoning by arsenic has taken place in our city since I last wrote. The verdict of the jury was that "the deceased died from poisoning by arsenic taken by misadventure." A Mr. Dove, a merchant and manufacturer of this city, sat down to his dinner with his wife and a visitor—a clergyman. The principal part of the meal consisted of a shoulder of lamb, which was placed in a pie-dish and baked in the oven. Now it was shown that this pie-dish had stood in the stable for some time and had in it a poisonous solution for killing weeds. After the meal Mr. Dove, his wife and the guest, the clergyman, were at once taken ill. Mr. James Smith, surgeon of this city, was called in and recognised that they were suffering from poison. Mr. Dove died after three days' illness; Mrs. Dove and the guest recovered. Mr. T. Hatfield Walker of this city, public analyst, stated that he found 200 grains of arsenic in the dish.

#### *Plumbism.*

An inquest was held last Saturday at Jarrow touching the death of a female lead worker aged thirty-four. It was shown that she had been employed at the white-lead works for about three months. She became ill about three weeks ago, and Mr. Norman certified that death was caused by convulsions due to lead poisoning. These unfortunate cases are, as I have notified from time to time, of frequent occurrence on the Tyne.

#### *Stockton Hospital.*

The annual meeting of the Stockton Hospital has been held, and the report showed that the number of patients treated during the year was 2369, being 243 in excess of last year. Of these 680 were in-patients. The report mentioned with approval the establishment of a branch of the Surgical Aid Society of London in Stockton and of the various efforts made in aid of the hospital by the amateur theatrical society, the friendly societies and the cycling demonstration.

#### *A Cottage Hospital for Easingwold.*

Through the munificence of Mr. J. Horatio Love of the Hawkhills, Easingwold, a new cottage hospital is being erected at the east end of the town. It will consist of large male and female wards, with proper accommodation for the matron and other hospital officials. The exterior, which will have a southern frontage, will be in the old English style.

#### *Demonstration at Sunderland.*

A very strange demonstration took place at Sunderland last Thursday. It arose from the action of the authorities in erecting a wooden building to be used, in case of necessity, as a cholera hospital. An immense and excited crowd formed in processional order, and, preceded by a yellow flag, marched to the Town Hall and besieged the health committee, which was then sitting, and remonstrated as to the situation of the hospital. As a result, the committee decided to remove the erection bodily and place it on a floating hopper in the river.

#### *Friendly Societies and Medical Charities.*

A very successful demonstration of the friendly societies of Sunderland was given on Sunday last and a useful collection was made in aid of the local medical charities. At South Shields also the trades societies turned out in large numbers and a collection was made from the vast crowd in aid of the Friendly Societies' Convalescent Home at Grange-over-Sands.

#### *Testimonials to Medical Men.*

Dr. Abrath, of the Hospital for Foreign Seamen at Sunder-

land, and the well-known litigant with the North-Eastern Railway Company, is to be made the subject of a testimonial which has been already largely subscribed to by men of all shades of opinion and position. The testimonial is not only a token of gratitude for services rendered in his professional capacity, but is intended as a special effort to help Dr. Abrath out of the somewhat unfortunate position in which he finds himself after six years' litigation with the North-Eastern Railway Company. Mr. A. E. Harris, the late medical officer of health for Sunderland, who is about to take a similar metropolitan office, has received a testimonial in the form of a handsome gold chronometer stop watch subscribed for by officers of the corporation, with a silver salver for Mrs. Harris.

#### *New Mortuary.*

The new isolation mortuary and post-mortem block, the gift of Miss Forster of London and South Hetton, and costing over £3000, was opened by Lady Londonderry on Monday last. These erections make the Sunderland Infirmary now one of the most modern and complete in the kingdom.

#### *The Cholera Ship in the Tyne.*

Up to the time of posting this letter there has been no further case on board the *Elbe*, now riding at quarantine in the Tyne. Newcastle-on-Tyne, Sept. 7th.

### SCOTLAND.

(FROM OUR OWN CORRESPONDENT.)

#### *The Board of Supervision and Cholera.*

THE Board of Supervision sent out at the end of last week important and urgent notices to the local authorities in Scotland bearing upon the precautions to be adopted against the introduction of cholera. One of these regulates the inspection and treatment of aliens arriving at Scottish seaports in a "filthy and otherwise unwholesome condition." It empowers the authorities to inspect vessels and to detain persons arriving in this condition. If permitted to travel they have to declare their destination, and instructions are given to have them kept under observation in the districts to which they travel. Copies of the memorandum on Cholera drawn up for the Local Government Board by Dr. Thorne Thorne have also been distributed. The local authorities in this district, and, in fact, all over Scotland, are bestirring themselves with earnestness, and the new army of experts in the country are keenly on the alert, and seem fully to realise that their action and success in baffling the invasion of the country by the threatening plague will do much to strengthen their position in the eyes of the public. Even in the smaller seaport towns and villages cleaning and other sanitary precautions are receiving quite unwonted attention.

#### *The Edinburgh Water Supply.*

As has been noticed here at various times, the Edinburgh and District Water Trust have been much exercised as to the question of increased water-supply *versus* measures for the prevention of waste. The matter has been reported on by engineers and considered by committees, and the outcome for the present is that at the last meeting of the committee it was determined to take no steps in either direction for the present.

#### *The Finances of the Edinburgh University.*

The annual report on the above made to the Secretary of Scotland has been issued. The total revenue for the year was £40,924 18s. 9d. and the expenditure £39,721 11s. 7d. Of this sum, the General University Fund amounted to £16,830 1s. 2d. and the expenditure from the fund was £16,677 0s. 1d. This report does not include the revenue of professors from class fees, which is probably not more than a fourth less than the whole revenue of the establishment.

#### *Appointments in the Royal Infirmary, Edinburgh.*

In October vacancies will occur in the Royal Infirmary, and appointments will then be made both on the medical and surgical sides of the hospital. There promises to be no lack of aspirants for the vacant posts, and already several have circulated their letters of application.

#### *Illness of Mr. Fasson.*

Many will hear with regret that Mr. Fasson, the medical superintendent of the Edinburgh Royal Infirmary, is suffering

from serious illness. He is, however, progressing as satisfactorily as could be expected, although his condition gives rise to grave anxiety.

Sept. 6th.

### IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

#### *Cholera Precautions.*

So long ago as December, 1890, the Local Government Board, in consequence of cholera having prevailed in Spain and Egypt, instructed their medical inspectors to place themselves in communication with the port nuisance authorities in Ireland and with the various sanitary authorities at the seaports. It was pointed out that, owing to rapid steam travelling, they should be prepared for the possibility of persons suffering from the early symptoms of cholera coming from a distant country and arriving here without their condition having been recognised at any outport. Since then the inspectors have been in constant communication with the sanitary authorities on this matter, and have been careful to see that the defects which formerly existed have been remedied. The principal sanitary precautions are matters relating to the purity of the water-supply, the efficiency of the drainage, and the arrangements for filth removal of every kind. It follows that the Local Government Board for Ireland for a considerable time past has not only been preparing for such an emergency as cholera, but for any severe outbreak of epidemic disease, as the precautions are necessarily the same. Last June diarrhoea of a suspicious character appeared in France, and the Board on July 15th issued an order prohibiting the importation of rags—a fertile source of infection—from France, and afterwards from the Black Sea ports and other places; and on July 17th one prohibiting importation of bedding and dirty clothing from the Baltic and North Sea ports. The cholera order of December, 1890, which applied to the whole of Ireland, contained full instructions to the various sanitary authorities and to medical officers of health as to the steps to be taken with reference to ships coming from any suspected place, the manner in which the passengers and crew were to be treated, whether the disease was present or not, and the arrangements for disinfection and for quarantine. On Aug. 22nd, when it was found that Asiatic cholera prevailed at Hamburg and two days afterwards at Antwerp, the Board, realising the danger to the United Kingdom, issued a final warning circular of instructions to all sanitary authorities throughout Ireland and instructions to all dispensary medical officers and workhouse officials. Should, unfortunately, the disease become epidemic in this country the Local Government Board possesses powers under the Public Health Act to issue special regulations; but as regulations of that character would involve a very wide departure from the existing law for the relief of the sick poor, and would cause a heavy expenditure on the part of the local authorities, such powers will only be exercised under circumstances of great emergency. To show the practical effect of the precautionary measures adopted it may be mentioned that the steamer *City of Dortmund*, which arrived on Friday week at Queenstown from Hamburg, was at once visited by the medical officer of health at Queenstown and the passengers and crew carefully examined; but as all were found to be healthy the steamer proceeded to Cork. If, however, cholera had been present the vessel would have been placed in quarantine and each infected person transferred to the Intercepting Hospital at Queenstown, which is ready for patients. The name and address of every person on board, with their place of destination, would also have been sent to the medical officer of health of the district to which they were going, and they would have been kept under observation for at least ten days. Very stringent arrangements have also been made by the harbour authorities and by the health department of the Corporation of Dublin to prevent the disease being admitted into Dublin. Should, however, the necessity arise, patients will be placed in the hospital ship outside the Alexandra Basin, while the Port and Docks Board have selected the quarantine station at the lighthouse opposite the Pigeon House, and at this place all vessels coming from foreign ports must remain until they are duly inspected by officials appointed by the Board of Trade.

*Health of Ireland.*

During the June quarter the births amounted to 28,146, or 24·3 per 1000, and the deaths to 23,146, or 20·0 per 1000. The birth-rate was 0·4 under the average for the corresponding quarter of the past ten years, and there was an increase in the death-rate of 0·8. Measles was very fatal in Dublin and Belfast, which raised the zymotic death-rate above the average. The deaths from measles numbered 644, against 161 for the previous quarter; scarlet fever, 112; typhus fever, 70, against 21; whooping-cough, 298; and enteric fever, 139. Compared with the returns for the corresponding quarter of 1891, those of pauperism show a decrease of 825 in the average number of workhouse inmates on Saturdays during the year, and a decrease of 3547, or 5·5 per cent., in the average number of persons on out-door relief.

*A Centenarian.*

The registrar of Killybegs, Glenties Union, has recorded the death of a lady at the alleged age of 115. She resided all her life in his district, and for a number of years he states that she was regarded as a curiosity, and many strangers who visited the district took the opportunity of seeing her. Her husband died when aged 101. She was always very industrious, and the registrar saw her a few days before her death at her favourite occupation of carding wool. Her faculties remained unimpaired to the end.

*Queen's College, Galway.*

During the past session the students numbered 110, of whom 38 were in the Faculty of Medicine. The medical school has had in the past exceptional difficulties to contend with, and therefore it is gratifying to learn that the main obstacles to the progress of this important department of the college have been removed. A Bill to provide for the reconstitution of the County Galway Infirmary received the Royal Assent on June 27th last, and, under the provisions of this Act, in place of the infirmary a public general hospital has been established, available for patients residing in the county and city of Galway. The power of appointing the medical staff of the new hospital having been vested in the Local Government Board, they have appointed the professors of the Faculty of Medicine in the Queen's College. The hospital will be available as a clinical school for the medical students attending the college, and it would be difficult to overestimate the importance of the Act with regard to the prospects of the medical school in Galway. Five physicians and surgeons—presiding over the respective departments of anatomy, surgery, medicine, materia medica and obstetrics—belonging to the college will be attached to the hospital; and these gentlemen, highly to their credit, be it said, have generously offered to act without fee or reward.

*Death under Chloroform.*

A young girl named Love, residing near Blackrock, lately lost her life by inhaling chloroform for toothache. She went to bed, partly covered her head, and then inhaled the chloroform. She became unconscious after a time, but the inhalation continuing, she was found dead some hours subsequently.

Mr. Peter Shannon died recently at his residence, 91, Stephen's-green, Dublin, at an advanced age. Deceased was a Fellow of the Royal College of Surgeons, and a kind and estimable gentleman.

Mr. Albert Hengler having given at his circus two hospital benefit performances, they realised £79 5s. 6d., which he supplemented with a contribution of £25, and handed the amount to the Lord Mayor for distribution among the hospitals.

Mr. Henry Pentland, L.R.C.P.I. &c., of Mohill, has been appointed to the Commission of the Peace for the County of Leitrim.

Sept. 5th.

(FROM OUR OWN CORRESPONDENT.)

*Regimen in Chronic Bright's Disease.*

THE question is often asked by the subject of Bright's disease, "What may I eat?" Nothing probably suits such cases so well as an exclusive milk diet, sparing as it does any excessive work for the diseased excretive organs and furnishing

sufficient nourishment for the organism. But, apart from its occasional constipating properties, such a diet ends by disgusting the patient, and some safe variety is needed. According to Dr. Germain Sée, nitrogenous articles should be suppressed and replaced by chocolate, rice, macaroni, sheep's brains and sweetbread, with a little tea. In a case recently treated by him, where, in addition to the above dietary, the alternate administration of bromides of calcium and strontium was had recourse to, the daily quantity of albumen passed fell in twenty-four hours from twenty-three grammes to six grammes, and at the end of ten days this quantity further fell to one gramme and the anasarca and other symptoms had disappeared. According to Dr. Dujardin-Beaumetz the treatment of chronic Bright's disease requires to be in conformity with the following principles—viz., the facilitating of the vicarious elimination of the toxins formed in the body and the restriction of their production within the limits of health. This latter object can be attained by means of intestinal antiseptics and an appropriate diet. The former is best procured by the administration of benzonaphthol, which, being free from phenol and salicylic acid, is to be preferred to salol. As regards diet, the sufferer should be a strict vegetarian, the only purely animal food allowed being eggs, which Dr. Dujardin-Beaumetz does not consider hurtful. In support of this view, he reminds us that there is no analogy between egg albumen and the serum albumen found in morbid urine. He attaches no prognostic importance to the quantity of albumen passed daily. Our object should be to prevent uræmia. In the matter of starchy foods, according to him, rice is of most value, being three and a half times more nourishing than even potatoes. All fruits, especially stewed, and all green vegetables, excepting cabbage, are allowed. Where there is reason to suppose that the kidneys are not in an advanced state of degeneration gelatinous meats may be added to the diet. In this list are included calves' heads, sheep's trotters, *veau en gelée* and *poulet au riz*. Fresh fish is not deleterious, but the fish bought in Paris and in all towns situated far inland always contains large quantities of toxins, and must therefore be avoided.

Paris, Sept. 7th.

## BERLIN.

(FROM OUR OWN CORRESPONDENT.)

*The Congress of the German Health Society.*

THE German Public Health Society holds its annual congress this year at Würzburg on the 8th, 9th, 10th, and 11th inst.

*The Berlin Vaccino Institute.*

Since 1887 an institution for the supply of vaccine has existed in the central cattle market here. Its management lies in the hands of a police medical officer, assisted by another medical man. About 140 female calves are used by the institute every year, for the use of which it pays fifteen marks (shillings) a head. The amount of vaccine obtained in 1887 sufficed for 105,650 vaccinations, in 1888 for 289,278, in 1889 for 427,282, in 1890 for 504,546. The institute now supplies Berlin, its garrison and the whole province of Brandenburg, and exports large quantities even across the ocean.

*Tight-lacing in a Factory.*

During the recent intense heat many of the female hands in the ammunition factory at Spandau, near Berlin, fainted. It was ascertained that most of these cases were due, not to the heat alone, but also to tight lacing. The wearing of corsets during the hours of work is now forbidden on pain of fine.

*Aluminium Flasks and Cooking Apparatus.*

Careful experiments have been made lately at the instance of the Prussian War Office, with a view to ascertaining with scientific accuracy the various advantages and disadvantages of flasks and cooking apparatus made in aluminium. Dr. Plagge, who made the experiments, states that the taste of the beverages usually carried in field flasks is not in the least altered by aluminium if the flasks are well cleansed first. It was observed, however, that cognac, if kept long in the flasks, makes dark-brown stains on the inner surface owing to the tannic acid it contains. Such stains sometimes give the cognac a dirty-brown colour. It was also observed that when drinking water is kept for a length of time in such flasks white stains, consisting of aluminium salts, appear on

the inner surface. They are easily removed, however, and are, like the above-mentioned brown stains, of no importance. The results of the experiments with cooking apparatus made in aluminium were extremely favourable.

*A new kind of Closet.*

A new method of dealing with excrements was demonstrated here lately by its inventor, a Russian captain named Nadein. The idea is to separate the liquid from the solid excreta and to utilise the latter. The main feature of the system is a parabolically shaped metal plate, down which, when properly adjusted in a closet, the liquids run into a gutter and thence into the main pipe, while the solids fall from the upper curve of the plate into a vessel, in which they are mingled by means of an automatic apparatus with earth, lime, or charcoal and converted into manure or fuel.

Berlin, Sept. 6th.

## Obituary.

SIR GEORGE H. B. MACLEOD, M.D. GLAS., F.R.C.S. EDIN.

SIR GEORGE H. B. MACLEOD'S sudden death on Aug. 31st has caused great regret among the community at large. He was in fairly good health until the previous Sunday, when he was attacked by pain in the cardiac region, which continued more or less until he passed away at his residence, 10, Woodside-crescent, Glasgow. He was a son of the late Rev. Dr. Norman Macleod of St. Columba, Glasgow, and was born at Campsie in the year 1828. He had thus reached his sixty-fourth year. He took his degree of Doctor of Medicine at Glasgow University in 1853. As was the custom then, all the examinations were passed at one time. When the Crimean War broke out he offered his services to the Government, and in February of 1854 was appointed senior surgeon of the civil hospital at Smyrna, and at a subsequent period, although the youngest officer, he was appointed interim superintendent. At this period, when engaged in active work, he communicated a series of articles to the *Edinburgh Medical Journal*, under the title, "Notes on the Surgery of the Crimean War, with remarks on Gunshot Wounds." His remarks were lucid, able and interesting, and attracted deserved attention. At the close of the Crimean War he commenced practice in Glasgow. Early in his career he became surgeon to the Royal Infirmary of Glasgow, and subsequently was appointed lecturer on surgery at Anderson's College. In these positions his reputation as a surgeon and as a lecturer grew apace, and on the transference of Sir Joseph Lister to Edinburgh in the year 1869 he was chosen Regius Professor of Surgery in Glasgow University. The choice of the Crown had nearly the unanimous approbation of the profession at home and abroad. After this honour crowded upon him. He was appointed Surgeon-in-Ordinary to Her Majesty in Scotland, Crown Member of the General Council of Medical Education and Registration, Associate Fellow of the College of Physicians of Philadelphia, Corresponding Member of the Academy of Medicine of Paris and the Surgical Society of Paris, and a Fellow of the Surgical Association of Germany. He was an Honorary Fellow of the Royal College of Surgeons of Dublin, and an LL.D. of St. Andrews; he was also a deputy-lieutenant and justice of the peace for Dumbartonshire. In the Jubilee year he received the honour of knighthood. His contributions to surgical literature were various, the most important being "Outlines of Surgical Diagnosis," "Surgical Affections of the Oesophagus, Larynx and Pharynx," "Wounds of the Thorax," "Tracheotomy," "Ulceration," "Ulcers," "Varix," "Wounds," in Cooper's Surgical Dictionary; "Surgical Affections of the Neck," in the American International Encyclopædia; "Clinical Teaching," in THE LANCET; "The Four Apostles of Surgery," in the *British Medical Journal*. As a teacher Sir George Macleod was a marked success. He had a wonderful command of language, and year by year his lectures attracted an enthusiastic and increasing band of *alumni*. In the clinical wards he was invariably kind to the patients, courteous to assistants, students and nurses, ready in his clinique at all times to explain away difficulties, and a model instructor—as Ruskin says, "A step in advance, with the lantern held low on the difficult path." He was a neat and

skilful operator, and his operations were based on a thorough and careful diagnosis. His interest in the patient did not end with the operation, for in major operations he personally superintended the dressing of the wounds, often doing a nurse's work himself, until all danger was over. His kindly words and his cheering presence visibly strengthened and materially aided recovery. He took a warm interest in local charitable institutions, and acted as treasurer and secretary for the West of Scotland of the British Medical Benevolent Fund. He was buried at Campsie, but the funeral service was conducted in Park Church by Principal Caird, and although no invitations were issued, for his relatives desired the funeral to be private, yet, as a mark of the respect in which he was held, the church was filled with mourners of both sexes, of all classes and conditions. The service was singularly impressive, and few of those who were present will forget how the great preacher's voice faltered when he spoke of his departed colleague, of his useful and honourable career and of his stainless life. As the mourners filed from the church it was difficult for those who knew him best to realise that one whose personality was so commanding and so unique had passed away for ever from our ken. Sir George Macleod was married in the year 1859 to Sophia, daughter of the late William Houldsworth. Lady Macleod and four sons and two daughters survive to mourn their sad bereavement. One of his sons, the Rev. W. H. Macleod, was recently appointed minister of the parish of Buchanan, in Stirlingshire.

WILLIAM WOOD, M.D., F.R.C.P. LOND.

THE late William Wood, M.D., F.R.C.P. Lond., was born on Sept. 16th, 1816. His father was medical officer in the 79th Light Infantry; his mother was the daughter of Sir John Ramsden, Bart. He entered as medical student at University College Hospital in 1834, and gained the Gold Medal for Anatomy and other distinctions. Here he formed friendships, which lasted throughout his life, with Erichsen, Brodie, Sewell, Jenner, Paget, Sieveking, Quain &c. Whilst at University College he worked a good deal with the famous Dr. Elliotson, and then went to study in Paris for some time. Whilst there the post of principal resident medical officer to the Bethlem Royal Hospital became vacant, and Dr. Wood was elected in May, 1845. During the tenure of his office there he adopted the humane treatment of the insane which had just been initiated by Conolly. In 1852 it was decided that there should be a complete change in the management of the hospital. Up to this time the staff had consisted of two visiting physicians and the resident medical officer. He therefore left and became part proprietor of a private asylum which had been established for some years at Kensington House. He resided there for a few years and then moved to 99, Harley-street, Cavendish-square, where he lived up till the time of his death. He soon became sole proprietor of Kensington House, carrying on at the same time a large consulting practice. In 1861 he was elected visiting physician to St. Luke's Hospital for the Insane, a post which he held for just thirty years, and on his resignation he was made consulting physician. In 1864 he was elected a Fellow of the Royal College of Physicians and served on several committees of that body.

In 1848 he became M.D. of St. Andrews. His life was devoted to the comfort and welfare of those entrusted to his care. He had always been a very active man both in mind and body, but during the last twelve months his health had been failing. At the beginning of this year he had an attack of pleurisy and pneumonia, from which he never completely recovered. About a month ago he went down as usual to Mendip, surrounded by his family, hoping that he might regain some strength, but about a fortnight ago he was again attacked with congestion of the lungs, and although for a time it was hoped that he might rally again, he somewhat suddenly passed away, without suffering, on Friday Aug. 26th, at the age of nearly seventy-six years. He was a man of the kindest and most generous disposition and enjoyed the love and esteem of all who came in contact with him. His name was associated with a large number of charities, and he was ever ready to assist anyone in trouble. In 1879 he was Vice-President of the Royal Medical and Chirurgical Society, and he was at one time President of the Medico-Psychological Association of Great Britain and Ire-

land. For some time he had been a member of the Parliamentary Committee of that Association and rendered valuable assistance during the passing of the last Lunacy Bill. He made several suggestions in a pamphlet which he wrote on Insanity and the Lunacy Laws, which were the result of his long experience and which received consideration at the hands of the framers of the Lunacy Act of 1890. He also wrote a small work on the plea of insanity, with statistics of the probable duration of life in the insane, and has contributed articles to THE LANCET, the *Medico-Chirurgical Review*, and other journals. He was engaged in many important legal cases in which the question of insanity was involved. The funeral took place on September 1st, at Putney Cemetery. There was a very large gathering of the profession and friends.

#### HENRY JOHN TYLDEN, M.A., M.D. OXON.

NOT long ago it was our sad duty to announce the death of Henry John Tylden, M.A., M.D. Oxon., M.R.C.P. Lond., who succumbed to an attack of typhoid fever. The disease at first appeared to be of an extremely mild form; in fact, Dr. Tylden must have been ill for some considerable time before he had the slightest suspicion that he was suffering from typhoid fever. Even after taking to bed the worst was not apprehended, but suddenly, as is often the case in this treacherous disease, he took a turn for the worse and rapidly sank. Henry John Tylden was born at Stamford Rectory, Kent, on December 14th, 1857. He was educated at Uppingham under the late Mr. Thring. Here he obtained school scholarships in 1870 and 1873. When he left in 1876 he was captain of the school and held one of the school exhibitions. On proceeding to Oxford he obtained the open scholarship at Exeter College. After a distinguished undergraduate career he obtained a first class both in moderations and in the final school. He continued in Oxford as a private tutor in history until 1881, when he determined to devote himself to the profession of medicine, entering as a student at St. Bartholomew's Hospital the following year. Here, again, he had a most distinguished career. He graduated in 1886 and was awarded the Brackenbury Scholarship. Continuing his studies in Vienna and in London, he was appointed casualty physician to St. Bartholomew's Hospital, and in 1888 he took the Murchison Scholarship in Clinical Medicine and became a Member of the Royal College of Physicians. Later he was appointed assistant physician to the City of London Hospital for Diseases of the Chest. Having decided to devote himself to the study of Pathology, he made a very careful analysis of the conditions met with in Pancreatic Diabetes, the results of which he gave to the Royal Medical and Chirurgical Society last winter. Continuing his pathological studies, he turned his attention to the subject of Typhoid Fever, and determined to investigate whether it was possible to produce artificial insusceptibility to this disease either by inoculation or other special treatment; he had already made several observations, when, unfortunately, he himself contracted typhoid fever. He maintained most strenuously that he could not possibly have taken it from his cultures, and that he believed he had contracted it in the usual fashion; whether this was the case or not it is now very difficult to say, but the sad fact remains that he was attacked, and with fatal results. Dr. Tylden was one of those thoroughly trained men, who with opportunity and health would have been capable of doing work of the very highest character; and the last article he wrote, on the "Bearing of Pathology on the Doctrine of Transmission of Acquired Characters," contains internal evidence of the broad view that he took of his subject and of the detailed and accurate character of his knowledge. All who came in contact with him felt that his was a mind of no ordinary power. Thoroughly trained and well stored with the most varied and accurate information, he was ever ready for any emergency, and with a fuller training in clinical observation and laboratory investigation he would doubtless have given to the profession scientific observations of the highest order. Those who knew him best entertained the highest opinion of him, whilst to those who had the opportunity of enjoying his friendship he was a man of singular honesty of purpose and goodness of disposition. Of a nervous temperament, he was not always ready to unfold at once and to everybody. As with all deep students, he often wished for quiet in which to think out what he was working at; but with those who

enjoyed his confidence he was always ready to discuss in the fullest manner possible his own difficulties and to help in those with which they were contending. His death will be deeply regretted by all with whom he came in contact, either personally or professionally.

#### ALEX. W. MACFARLANE, M.D. GLAS., F.R.C.P. EDIN.

THE profession can ill spare from its ranks men of the type of Dr. Macfarlane, who at an early age has so recently gone from amongst us. Dr. Macfarlane, some five years ago, gave up an extensive but trying practice in Kilmarnock in order to come to London, where he hoped to have time to recruit and leisure to devote himself to literary and scientific work. For some years he rapidly improved in health. Latterly, however, especially during the last two or three months after an attack of influenza, he had been far from well; still, no serious symptoms sufficient to alarm even his professional friends had made their appearance until a day or two before he succumbed to an attack of kidney disease, which now appears to have been of considerable standing. The son of a Scottish minister, Alexander William Macfarlane was born in Cumberland. In his early school days he developed a remarkable capacity for accurate and conscientious work, and after a short apprenticeship with a doctor he decided to continue his studies. Passing his preliminary examination in Edinburgh and Glasgow, he commenced his medical studies in Edinburgh, and afterwards continued them in Glasgow, where he took a most distinguished position in many of his classes. His last year of undergraduate study he spent at the University of Edinburgh, where he took the degree of I.M., which at that time was a separate qualification; in 1867 he obtained the degree of M.B., C.M. (Glas.), graduating with distinction; and in 1872 he was commended for the thesis which he submitted to the Faculty for the M.D. degree. He immediately commenced to practise in Polmont, and was appointed medical officer of health for Polmont and Muiravonside. After spending seven years in Polmont, where he built up a lucrative practice, he went in 1874 to Kilmarnock, succeeding to Dr. Paxton's practice. Between the years 1874 and 1887 Dr. Macfarlane had one of the best country practices in Scotland; patients came from far and near to consult him; rich and poor alike had the greatest faith in his diagnosis and treatment; his patients became his firm friends; but the strain of this rapidly increasing practice, added to the anxiety and work involved in his appointment as surgeon to the Glasgow and South-Western Railway, consulting physician and (later) physician to the Kilmarnock Hospital and Infirmary, examiner in medicine and clinical medicine and in public health and medical jurisprudence in the University of Glasgow, and examiner in medical legal cases in North Ayrshire, soon rendered it imperative that he should obtain rest in some way or other. Eventually he decided to leave for London, where, however, many of his best patients still continued to consult him. His removal from Kilmarnock was looked upon by his Kilmarnock and Ayrshire friends as being little less than a public calamity, and the writer of this notice well remembers the scene at the banquet and presentation in his honour, at which the congratulations were so intimately mingled with regrets that it was difficult to determine whether the occasion was one for rejoicing or for sorrowing, but, from all, the expressions of regret and personal friendship were so spontaneous and hearty that everyone present could not but feel that Dr. Macfarlane had been more than medical adviser; he had been a trusted friend and a valued citizen. On his arrival in London, where he came apparently in order that his children might have educational opportunities unattainable in Kilmarnock, he devoted himself to study and to the arrangement of the clinical studies he had made during his early life, and with the rich material that he had at his command he was able to give to the profession one of the best treatises we have on the difficult subject of insomnia. He was well known at the Royal Medical and Chirurgical and the Clinical Societies, in the proceedings of both of which he took a lively interest; and his papers published in the medical journals indicate what wide experience and acute perception he brought to bear on his medical work. Shortly before his death he was engaged in experimental work on the action of various drugs on the cerebral circulation, but owing to an attack of influenza followed by considerable weakness he had to discontinue this

research before he had done more than succeed in obtaining a method that would give him accurate results. Latterly his practice had been increasing by leaps and bounds, and for some time before his death it is to be feared that his experimental work was carried on at the expense of the leisure and rest that were so necessary for the continuance of his health. He was a man of great determination and steadfastness of purpose, and bringing an original and well-trained intellect to bear on his work he succeeded because no detail was too small to attend to and no labour too great for him to undertake in order that he might carry his work to a successful issue. His patients were immediately impressed with these qualities, whilst his genial manner, unblemished integrity and frank outspokenness, his kindness of spirit, subtle wit and keen sense of humour gained for him the friendship not only of all classes of patients but also of his colleagues, all of whom will sympathise most deeply with his widow and children—two sons and two daughters—in the loss which they have sustained.

**SURGEON-MAJOR STEPHEN MASSETT WEBB,  
M.D. EDIN.**

We regret to have to announce that Surgeon-Major Stephen Massett Webb of Kinterbury, Newton Abbott, and 3, Mutley Park-terrace, Mannamend, Plymouth, died at the latter-named residence on the evening of Aug. 3rd last, at the age of sixty-three. He was born in Hoxton-square on Jan. 10th, 1829, and was a son of William Webb, Esq., a scion of the ancient family of Webb of Odstock Manor, Wilts, by his second wife, daughter of Thomas Massett, Esq. He was younger brother to the Rev. William Webb, M.A., the accomplished rector of Ryton, and to Francis C. Webb, M.D., F.R.C.P., of Woburn-place, Russell-square. He was educated at King's College School and at Stonehouse Grammar School, and, after reading for a short time with a private tutor, matriculated at the University of London. In the year 1846 he entered as a student at University College Hospital, where he soon became known as a man of rare ability and capacity for work; during his student life he was awarded silver medals in anatomy and surgery, the gold medal for anatomy and physiology, and a sheaf of certificates of honour. In 1850 he was enrolled as a Member of the College of Surgeons and as a Licentiate of the Apothecaries' Society. After a short period passed as an assistant to the late Mr. Bowmar of Leicester he proceeded to the University of Edinburgh, and in 1852 he graduated as a Doctor of Medicine. In 1854 he entered the army as an assistant surgeon in the 36th Foot; he was duly promoted surgeon and surgeon-major. His first commission bears date May 19th, 1854. On first joining his regiment, which was then stationed at Salford Barracks, he had for his senior medical officer the late Dr. James Jopp. Soon after receiving his commission Dr. Webb had orders to proceed to the Crimea. Embarking from Kingstown, he landed in the Crimea during the November of 1854, was attached to a battery of artillery, and was present at the siege of Sebastopol. Towards the end of the war he was for some time in charge of the Officers' Hospital at Scutari, and while there among his patients was numbered Lieutenant (now Sir Evelyn) Wood, whose mother, Lady Wood, presented Dr. Webb with his own portrait in water-colours, which she had painted in the corridor of the hospital, as a slight acknowledgment of her regard and of his professional skill. For his services during the campaign he received the Crimean medal, with the clasp for Sebastopol and the Turkish medal. On his return from the Crimea Dr. Webb was ordered to join his regiment in the West Indies, where yellow fever was raging. On returning from foreign service Dr. Webb exchanged into the 1st Battalion of the 23rd Foot (the Royal Welsh Fusiliers), with which regiment he served for some years in India, and an officer of which corps he continued until the abolition of the regimental system. In 1877, owing to ill-health, he was obliged to retire from the service, and, settling in Devonshire, there passed the remainder of his days. Dr. Webb was considered one of the best medical officers in the Service, and frequently received the highest praise from his superior officers. He was highly esteemed and loved by his brother officers, both as a genial friend and as a medical

adviser. He was for many years a member of the Army and Navy Club. In addition to his professional attainments Dr. Webb was a highly accomplished man; he was an excellent musician, and possessed a cultivated taste in painting and in art generally. He married Jane, daughter of Mr. Henry Sewell, a companion who showed her deep devotion to him during many years of suffering from the gouty diathesis, and who only survived him for the short space of fourteen days. Surgeon-Major Webb was buried at Plymouth on Aug. 8th. Soon after his return from the Crimea an excellent medallion portrait was executed of him by Mr. C. B. Birch, A.R.A., the eminent sculptor, of which several casts are still in the possession of his family.

## Medical News.

**ROYAL COLLEGE OF SURGEONS OF ENGLAND.**—The following gentleman, having passed the necessary examinations, and having conformed to the by-laws and regulations, has been admitted a Member of the College:—  
T. H. Adams, L.S.A. Lond.

**THE British Pharmaceutical Society** is to hold its annual meeting next year in Nottingham.

**DEVIZES COTTAGE HOSPITAL.**—The funds of this hospital have profited to the extent of £103 as a result of the recent Jubilee Oddfellows' Fête held in the town.

**THE Accrington Town Council** has resolved to expend £713,000 in the purchase of the gas and water works of the town.

**THE LOUGHBOROUGH SEWAGE DISPOSAL SCHEME** has been sanctioned by the Local Government Board, and £20,000 is to be spent on carrying out the project.

**THE MIDDLESEX HOSPITAL.**—At the recent quarterly court of this hospital it was announced that the new children's ward is complete and that the £1000 promised by the executor of the late Mrs. Holms, to meet the cost of the addition, has been received.

**HOSPITAL SUNDAY AND SATURDAY IN THE PROVINCES.**—Eastbourne, Bournemouth, Swinton, Todmorden and other towns and districts have within the past few days been making, with more or less success, their annual collections in aid of the medical charities in their respective precincts. It is pleasant to see the hold which is being gradually obtained on the minds of the benevolent on behalf of these institutions.

**SUNDERLAND INFIRMARY.**—On Monday last the ceremony of opening the new wing of the infirmary was carried out by the Marchioness of Londonderry in the presence of a distinguished company. The block will contain a new ward, to be set apart for the reception of infectious cases which may arise in the hospital. Another portion will be used as a post-mortem room. The cost of the adjunct will be about £3000.

**THE COLLEGE OF MEDICINE AT HONG KONG.**—Under the skilful and energetic management of Mr. Cantlie, who will be remembered by many of our readers as an esteemed colleague on the medical staff of Charing-cross Hospital, the Hong Kong College of Medicine is able to show a worthy record of work done during the past year. On July 24th the prizes and diplomas gained by the *alumni* of the college were presented by Sir Wm. Robinson, the Governor. At the conclusion of this ceremony the dean, Mr. Cantlie, delivered an address in which he described the course of study pursued at the Chinese College, which, he said, is exactly similar to that obtaining in the medical schools of Great Britain. The Alice Memorial Hospital, which had been placed at the disposal of the college by the London Missionary Society for the practical treatment of disease, had been found amply sufficient for the needs of the students, and altogether the dean considered he had abundant ground for congratulation on the prosperity and efficient work of the institution.

**MEDICAL MAGISTRATE.**—Mr. Thomas M. Dolan, M.D., has been placed on the Commission of the Peace for the Borough of Halifax.

**SWINE FEVER** appears to be very prevalent in the West Riding, and precautions against its spread are being taken at Ravensthorpe, Liversedge, Priestfield and other districts.

**BEQUESTS AND DONATIONS.**—The committee of the Cheyne Hospital for Sick and Incurable Children, Chelsea, have received a donation of 100 guineas to the funds of the hospital from Mr. William White, of Chelsea.

**VACCINATION GRANTS.**—Mr. F. M. D. Swallow, L.R.C.P., L.R.C.S. &c., of the Silkstone District of the Penistone Union, Yorkshire, has for the third time received the Government grant for efficient vaccination in his district.—Dr. Hugh Miller, Public Vaccinator for Birkenhead, has been awarded the Government grant for efficient vaccination in his district.

**MESSAGE OF CONDOLENCE FROM THE QUEEN.**—Her Majesty has, through Dr. Reid, telegraphed a message of condolence to the Rev. W. H. Macleod, son of Sir George Macleod, Surgeon-in-Ordinary to the Queen in Scotland, whose death has just been announced. The message runs as follows: "The Queen commands me to express to you her very deep regret at your father's death, and her sincere sympathy with your family in the great loss you have sustained."

**PRESENTATIONS.**—As an acknowledgment of the value of the services of Mr. T. Vincent Jackson, F.R.C.S., in conducting a course of instruction in ambulance work at Wolverhampton, the members of the Hospital Saturday Committee in connexion with the Wolverhampton General Hospital have presented that gentleman with a handsome carriage clock.—The officials connected with St. Saviour's Infirmary, East Dulwich, have presented the medical superintendent, Dr. H. E. Harris, with a handsome silver tea service, on the occasion of his approaching marriage.—Last week Dr. John Martin Savage was presented with a handsome marble timepiece, in recognition of his services as instructor to the St. John Ambulance Class of the Kimberley Colliery, near Nottingham.

**WORTHING INFIRMARY.**—The report of the committee of management of this charity, presented to the subscribers and friends at the annual meeting held last week, gave a favourable account of the beneficent work effected in the institution during the past year. The treasurer's account, though it has not exhibited a falling off as compared with the finances of the last twelvemonth, would seem to be not particularly flattering to the generosity of the town. An urgent appeal is made to the benevolent to come to the aid of this useful charity.

**THE SUNDERLAND INFIRMARY ISOLATION BLOCK.**—The new isolation mortuary and post-mortem block, adjoining the Sunderland Infirmary, is now practically completed, and is to be opened by the Marchioness of Londonderry on Monday next. The block is the gift of Miss Forster of South Hetton, and provides facilities for the immediate isolation of patients in the event of an outbreak of infectious disease in the institution. The whole of the internal arrangements have been carefully planned and carried out, and the new block will form an important and valuable addition to the infirmary.

**LONDON CORONERS.**—An Order in Council appeared in last night's *Gazette* that the county of London shall be divided into eight districts for coroners' purposes, to be named respectively the Eastern Coroner's District, the North-eastern Coroner's District, the Central Coroner's District, the Western Coroner's District, the Penge Coroner's District, the Southern Coroner's District, the South-western Coroner's District and the South-eastern Coroner's District, and the said districts shall respectively comprise the several parishes and places, and have the boundaries prescribed and mentioned in that behalf in the schedule to the order. Further orders divide the county of Middlesex into three districts, and the counties of Kent and Hertfordshire into six districts each, for coroners' purposes.

## Appointments.

*Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.*

- ADAMS, Dr. CAMPBELL R., has been appointed Government Medical Officer and Magistrate for the Toledo District of British Honduras.
- ATKEY, P. J., L.R.C.P., M.R.C.S., has been appointed House Surgeon to St. Thomas's Hospital.
- BANKS, A., L.R.C.P., M.R.C.S., has been appointed House Surgeon to St. Thomas's Hospital.
- BEDDIE, WM., M.B., C.M. Aberd., has been reappointed Medical Officer to the Fraserburgh Police.
- BIDDLECOMBE, E. H., L.R.C.P. Lond., M.R.C.S., has been appointed Honorary Physician to the Royal United Hospital, Bath, vice Goodridge, resigned.
- BLACKHAM, ROBERT JAMES, L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., L.M. (Rotunda), has been appointed Assistant Medical Officer to the Ton and Bwlfa Collieries, Pentre, Rhondda Valley, South Wales.
- BOWRING, W. A., L.R.C.P., M.R.C.S., has been reappointed Resident House Physician to St. Thomas's Hospital.
- BURDEN, H., L.R.C.P., M.R.C.S., has been appointed House Surgeon to St. Thomas's Hospital.
- CAHILL, MARK FRANCIS, J.R.C.P., L.R.C.S. Irel., has been appointed Assistant Surgeon to the Children's Hospital, Dublin.
- CLARK, FRANCIS W., M.R.C.S., L.R.C.P., D.P.H. Camb., has been appointed Temporary Assistant Medical Officer of Health to the Tyne Ports, with instructions to board every vessel coming from a suspected port, and examine the passengers and crew with a view to preventing the introduction of cholera into this country.
- GRAVEN, R. M., F.R.C.S. Eng., F.R.C.S. Edin., has been reappointed Medical Officer of Health for the Combined Districts of Westmoreland, for three years.
- DALGETTY, ARTHUR B., M.B. C.M. Aberd., has been appointed Medical Assistant to the Dundee Royal Lunatic Asylum.
- DALZELL, A., L.R.C.P., M.R.C.S., has been reappointed Clinical Assistant for Diseases of the Throat to St. Thomas's Hospital.
- DORMAN, M. R. P., M.A., M.B., B.C. Cantab., has been reappointed Clinical Assistant for Diseases of the Throat to St. Thomas's Hospital.
- ELSON, F. J., L.R.C.P. Edin., M.R.C.S., has been reappointed Medical Officer and Public Vaccinator to the Whitwell and Cuckney Districts of the Worksop Union.
- FISHER, J. H., L.R.C.P., M.R.C.S., has been appointed House Surgeon to St. Thomas's Hospital.
- FOOKS, W. P., M.A., M.B., B.C. Cantab., L.R.C.P., M.R.C.S., has been reappointed Non-resident House Physician to St. Thomas's Hospital.
- FREDERICK, H. J., L.S.A., has been appointed Clinical Assistant for Diseases of the Ear to St. Thomas's Hospital.
- GUNN, MARCUS, M.A., F.R.C.S., has been appointed Honorary Ophthalmic Surgeon to the Cheyne Hospital for Sick and Incurable Children, Chelsea.
- HAYDON, T. H., B.A., M.B., B.C. Cantab., L.R.C.P., M.R.C.S., has been appointed Senior Obstetric House Physician to St. Thomas's Hospital.
- HEYGATE, WM. H., M.R.C.S., L.S.A., has been appointed Medical Officer for the Southwick District of the Fareham Union, vice Langford, deceased.
- KENNY, G. G., M.B. Glas., has been reappointed Medical Officer to the Waikato Hospital, Auckland, New Zealand.
- LAW, R. R., B.A., M.B., B.C. Cantab., has been appointed Assistant House Surgeon to St. Thomas's Hospital.
- LOVELL, C. P., M.A., M.B., B.Ch. Oxon., L.R.C.P., M.R.C.S., L.S.A., has been reappointed Clinical Assistant for Diseases of the Skin to St. Thomas's Hospital.
- MAC KEITH, JOHN, M.B., C.M. Glas., has been appointed Medical Officer to the Third District of the Exeter Union, vice Bell, resigned.
- MONAGHAN, T. J., L.R.C.P., L.R.C.S., D.P.H. Edin., D.S. Sc. Vict. Univ., has been appointed Medical Officer of Health for the Borough of Accrington.
- MORRIS, C. DWIGHT, L.R.C.P. Lond., M.R.C.S., L.S.A. Lond., has been appointed Medical Officer of Health to the Staines Rural Sanitary District.
- NEECH, JAS. T., L.R.C.P. Edin., L.F.P.S. Glasg., has been appointed Medical Officer of Health to the Atherton Local Board.
- NORGATE, ROBERT II., M.R.C.S., L.R.C.P. Lond., has been appointed Second Assistant Medical Officer to the Kent County Asylum, Barming Heath.
- OLDMAN, C. E., M.D., M.R.C.S., has been appointed Medical Officer of Health to the Godstone Rural Sanitary District.
- PARTINGTON, W., M.B., C.M. Glasg., has been appointed Medical Officer of Health for the Tunstall Urban Sanitary District, vice Cumine, resigned.
- PRICE, A. E., L.R.C.P., M.R.C.S., has been appointed Clinical Assistant for Diseases of the Ear to St. Thomas's Hospital.

PURVIS, W. P., B.Sc. Lond., L.R.C.P., M.R.C.S., has been reappointed Clinical Assistant for Diseases of the Skin to St. Thomas's Hospital.

RALPH, HUGH, M.R.C.S., L.R.C.P., has been appointed Junior Resident Medical Officer and Registrar to the Evelina Hospital, vice A. H. Cheate, resigned.

RYALL, CHARLES, L.R.C.S., L.R.C.P. Edin., L.F.P.S. Glasg., has been appointed Resident Medical Officer to the Victoria Hospital, Lewes.

SIMPSON, H., B.A., M.B., B.C. Cantab., L.R.C.P., M.R.C.S., has been appointed Assistant House Surgeon to St. Thomas's Hospital.

WALLACE, F. G., M.A., M.B., B.C. Cantab., L.R.C.P., M.R.C.S., has been reappointed Non-resident House Physician to St. Thomas's Hospital.

WALLACE, C. S., L.R.C.P., M.R.C.S., has been appointed Junior Obstetric House Physician to St. Thomas's Hospital.

WATKINS-PITCHFORD, W., L.R.C.P., M.R.C.S., has been appointed Resident House Physician to St. Thomas's Hospital.

WILSON, JOHN, L.R.C.P., L.R.C.S. Edin., has been appointed Medical Officer of Health for Sunderland, vice Harris, resigned.

## Vacancies.

For further information regarding each vacancy reference should be made to the advertisement.

ANCOATS HOSPITAL, Manchester.—Honorary Physician.

CHelsea HOSPITAL FOR WOMEN, Fulham-road, London, S.W.—Two Clinical Assistants wanted. The fee is £3 3s. for three months' course; A. L. Davis, Secretary.

COUNTY ASYLUM, Prestwich, Manchester.—Assistant Medical Officer. Salary commences at £100 per annum, with prospect of an increase of £25 at end of first year, £25 at end of second year, and further increases. Furnished apartments, board, washing and attendance. Candidates must be unmarried. Applications to be made to the Superintendent.

E. N., THE LANCET Office, 423, Strand, W.C.—Out-door Assistant to take charge of Dispensary in S.E. district. Salary over £200 a year, and one day allowed off per week.

FOREST HILL PROVIDENT DISPENSARY.—Medical Officer, early in October; after election must reside within area of the Dispensary.

GENERAL HOSPITAL, Birmingham.—The post of Pathologist. Salary £120 per annum. Election takes place on 7th October. Duties to commence forthwith.

GENERAL HOSPITAL, Birmingham.—House Physician. Salary £70 per annum, with residence, board and washing. Applications must be made before Oct. 1st to Howard J. Collins, House Governor.

GENERAL HOSPITAL, Birmingham.—Surgical Casualty Officer. Salary £70 per annum. Hours of attendance 9 A.M. to 1 P.M., Sundays excepted.

GENERAL HOSPITAL, Nottingham.—Senior Resident Medical Officer, for two years. Salary £120 for the first year, rising £10 a year up to £160, with board, residence and washing.

GENERAL INFIRMARY, Northampton.—Assistant House Surgeon. Applicants must be unmarried and not under twenty-three years of age. Salary £80 per annum, with furnished apartments, board, attendance and washing.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway-road, N.—House Physician. Applications to be made before Sept. 20th. Salary £90 per annum, with board and lodging in the hospital.

HUNTINGDON COUNTY HOSPITAL.—House Surgeon. Salary £60 per annum, with board.

KIMBERLEY HOSPITAL, South Africa.—Senior House Surgeon. Salary £750, with quarters.

LIVERPOOL HOSPITAL FOR CANCER.—Honorary Assistant Surgeon. Applications not later than Wednesday, Sept. 21st.

PARISH OF ST. LEONARD, Shoreditch.—Clinical Assistant for the Infirmary, Hoxton-street, N., for six months. Salary £40 per annum, with rations, furnished apartments, and washing in the Infirmary. (Apply to the Medical Officer, 204, Hoxton-street, N.)

POPLAR AND STEPNEY SICK ASYLUM DISTRICT.—Dispenser. Salary £2 10s. per week; hours 10 till 6.

ROYAL SURREY COUNTY HOSPITAL, Guildford.—Assistant House Surgeon. The appointment for six months without salary, but with board, washing and lodging in the institution.

SCARBOROUGH HOSPITAL AND DISPENSARY.—House Surgeon, to commence duty first week in October. Salary £80 per annum. Applications must be sent before Sept. 20th to the Secretary, Elders-street, Scarborough.

ST. MARY'S HOSPITAL MEDICAL SCHOOL.—Vacancy for a new Chair of Biology. Applications to be sent in on or before Monday, Oct. 10th. Salary £120 per annum. Particulars of the Dean.

WORCESTER CITY AND COUNTY INSTITUTION FOR TRAINED NURSES AND HOME HOSPITAL.—Lady Superintendent. Salary £80 per annum; not more than forty years of age.

WORCESTER COUNTY AND CITY LUNATIC ASYLUM.—Third Assistant Medical Officer; unmarried. Salary £100 per annum, with board, lodging and washing.

## Births, Marriages and Deaths.

### BIRTHS.

AUDLAND.—On Aug. 24th, at Brooklands, Wellingborough, the wife of W. E. Audland, L.R.C.P. Lond., M.R.C.S., of a daughter.

BEALE.—On Aug. 28th, at Addison-road, Kensington, the wife of E. Clifford Beale, M.B., F.R.C.P., of a son.

BEDDOW.—On Aug. 25th, at Rectory-road, Stoke Newington, the wife of Josiah Beddow, M.R.C.S., of a daughter.

PIDCOCK.—On Aug. 22nd, at Fitzjohn's-avenue, Hampstead, the wife of G. Douglas Pidcock, M.D., M.R.C.P. Lond., of a son.

RECKITT.—On Sept. 4th, at High-street, Boston, Lincolnshire, the wife of Edward B. Reckitt, L.R.C.P. Edin., of a daughter.

ROGERS.—On Sept. 1st, at York-place, Clifton, Bristol, the wife of Bertram Mitford Heron Rogers, M.B., B.Ch., of a daughter.

ROUSE.—On Aug. 31st, at Cheyne-gardens, S.W., the wife of Robert Rouse, Deputy Surgeon-General I.M.D., retired, of a son, stillborn.

### MARRIAGES.

BEST-BEATTIE.—On Sept. 1st, at Christ Church, Dover, William Jas. Duncan Best, M.R.C.S., L.S.A. Lond., to Helen Henrietta Mary (D'Ettle), eldest daughter of the Rev. H. H. Beattie, LL.D., Chaplain to the Forces, Dover.

BROWN-COWARD.—On Aug. 24th, at the Parish Church, Bowdon, by the Ven. Archdeacon Gore, D.D., Vicar, and the Rev. C. A. Lomax, Rector of Heaton Mersey, Alfred Brown, M.A., M.D., of Higher Broughton, Manchester, son of the late William Brown, of Leighton, to Ethel, third daughter of Edward Coward, J.P., Heaton House, Heaton, Mersey, and Hetherlea, Bowdon. No cards.

BROWN-MATHEWS.—On Aug. 31st, at St. Peter's, Wolverhampton, Herbert Henry Brown, M.D., B.S. Lond., F.R.C.S., of 22, Museum-street, Ipswich, to Florence M. de Hane, youngest daughter of Charles Mathews, of Wolverhampton.

COLLETT-NICOLLS.—On Sept. 3rd, at St. Augustine's Catholic Church, Weymouth, Henry Geo. Outram Collett, L.R.C.P. Lond., M.R.C.S., only son of the late Henry Collett, R.N., of Richmond, Surrey, to Frances Mary, eldest daughter of the late Archd. Dowdall Nicolls, Esq., of Tullyard, Trim, co. Meath.

COWELL-ROE.—On Sept. 1st, 1892, at St. Barnabas, Pimlico, by the Rev. C. O. Becker, Curate in Charge, George Cowell, of Cavendish-place, Cavendish-square, to Mary Margaret Elizabeth, widow of Dr. Hamilton Roe, of Harrington-gardens, and daughter of the late John Laurie, Esq., M.P.

CROW-MARSTON.—On Sept. 1st, at the Parish Church, Knowle, Daniel Crowe, M.B., B.Ch. Trin. Coll., Dub., son of Michael F. Crowe, J.P., Meldfield, Blackrock, co. Dublin, to Clara, daughter of John Marston, Parkfield, Knowle, Warwickshire.

FAILES-WARD.—On Aug. 31st, at Torrington, St. Clement's, by the Rev. Watson Failes, Assistant Master in Westminster School, assisted by the Rev. M. Croese, Vicar, Frederick George Failes, M.R.C.S. Eng., L.S.A., of Coonabaralran, New South Wales, son of the late Christopher Failes, of Fitton Hall, St. German's, Norfolk, to Frances Mary (Beda), elder daughter of David Ward, of Hamond Lodge, Terrington, St. Clement's, Norfolk.

LOCKWOOD-PARKER.—On Sept. 3rd, at St. Andrew's, Sharrow, by the Rev. Canon F. W. Goodwyn, Vicar of Rotherfield, Harry Lockwood, M.R.C.S., youngest son of the late Chas. Lockwood, Greno House, to Alice Jane, only daughter of the late Kenyon Parker.

VINTER-TOMS.—On Sept. 6th, at the Parish Church, Shepperton-on-Thames, by the Rev. A. E. Vinter, Principal of the Derby Training College, brother of the bridegroom, assisted by the Rev. F. W. Vinter, uncle of the bridegroom, and by the Rev. C. Littledale, Vicar, Sydney Garratt Vinter, of Torpoint, Devonport, formerly of the Perak Goo Service, to Frances, youngest daughter of the late William Tucker Toms, of Chard, Somerset.

WILLEY-CARR.—On Aug. 31st, at St. Mark's Church, Sheffield, Charles Henry Willey, M.D., B.Sc., of Sharrow, Sheffield, to Ellen Ada Carr, youngest daughter of the late William Carr, of Ceylon House, Sheffield.

### DEATHS.

BARKER.—On Aug. 23rd, at Mile-end-road, E., Joseph Collier Barker, L.K.Q.C.P. Irel., L.R.C.S., in his 48th year.

BARNES.—On Aug. 25th, at Ewell, Surrey, George Robinson Barnes, M.D., aged 60.

CHURCHILL.—On Sept. 2nd, at his residence, Hall Croft, Gosforth, Cumberland, John Churchill, M.R.C.S., and J.P. for Cumberland, aged 77.

MCDONNELL.—On Aug. 27th, at Widnes, James McDonnell, L.F.P.S. Glasg.

MORGAN.—On Sept. 5th, at Knutsford, John E. Morgan, M.D.

PUGH.—On Aug. 23rd, at Catherine-street, Liverpool, Rhinallt N. Pugh, M.B. Lond., F.R.C.S. Eng.

PYE.—On Sept. 2nd, Walter Pye, F.R.S.E., late of 4, Sackville-street, Piccadilly, aged 39.

ROGERS.—On Sept. 1st, at his residence, Cannon-place, Brighton, Robert James Rogers, M.R.C.S., J.S.A. Lond., deeply regretted.

SALZMANN.—On Aug. 31st, at Downford, Montpelier-road, Brighton, Frederick Wm. Salzmann, M.R.C.S., in the 43th year of his age.

SPACKMAN.—On Sept. 2nd, at Bovers House, Harpenden, Herts, Frederic Robert Spackman, M.D. Lond., in his 74th year.

WOOD.—On Aug. 26th, at The Willoughbys, Bgldon, R.S.O., Somerset, William Wood, M.D., F.R.C.P., also of Harley-street, London, and the Priory, Rothampton, Consulting Physician to St. Luke's Hospital, aged 75.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

## Notes, Short Comments & Answers to Correspondents.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

All communications relating to the editorial business of the journal must be addressed "To the Editors."

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET to be addressed "To the Publisher."

We cannot undertake to return MSS. not used.

### TIN-LINED IRON PIPE.

MESSRS. E. WALKER AND CO. of Heckmondwike, Yorks, the patentees of the tin-lined iron pipe, point out an amusing interpretation put upon our remarks in a leading article in which the substitution of tin or tin-lined piping for lead piping was considered. One drawback to the use of tin piping was, we stated, its tendency to "kink"—that is, to collapse with cracking when it is bent. This remark, the patentees inform us, led to the inquiry as to whether a tin pipe did not have a tendency to cause "kink cough" (whooping-cough). We also note that a contemporary represents us to say that tin tends to harden the water. On the contrary, it was distinctly stated that tin was absolutely proof against the solvent power of water, affecting it in no way whatever. In fact, in this respect tin is practically as inert as the noble metals gold, platinum or silver.

*Aqua Pura.*—Those in which silicated carbon, manganous carbon, magnetic iron spongy iron and Kieselguhr are used as filtering agents are best. Animal charcoal is an efficient filtering medium; but care must be taken to secure only the perfectly pure kind, which is entirely free from nitrogenous matter. According to Dr. Percy Frankland, coke is certain in effecting the removal of germs; it is certainly inexpensive, and may be thrown away and replaced by fresh material when it becomes foul. It is difficult, however, to rid coke entirely of tarry matter and grit, continued washing with clean water being required before this condition is attained. Filters in which the filtering medium cannot be cleansed or replaced are worse than useless; and it is further indispensable that the water be also efficiently aerated.

Dr. R. H. Lloyd.—We do not think that under the circumstances the letter in question should be looked upon in the light of an advertisement.

### "THE CAPE FOR PHTHISIS."

To the Editors of THE LANCET.

SIRS,—I have pleasure in complying with Dr. Hay Reynolds's request by giving him some information as to the places at the Cape most suitable for phthisical patients.

Dr. Reynolds has made a clerical slip in saying that he is sending his patient to winter at the Cape; he doubtless means to escape from an English winter. She will arrive just in time for a long summer. This is important, as the western side of the Cape should be avoided in winter, owing to its dampness. I will confine myself to indicating places climatologically suitable. The conditions of places as to fitness for invalids are often changing owing to the amenities of hotel life not being constant. During the process of development of a country like the Cape there is much restlessness, and a man who has established a comfortable hotel may become seized with a desire to grow rich with greater speed and move off to the Gold Fields, leaving perhaps an unsatisfactory successor. Dr. Reynolds's patient should therefore seek advice on this point at Cape Town or Port Elizabeth, and here I may say that the colonists are very courteous and kind. Travelling at the Cape is now easy and comfortable if it be confined to the railway routes, which are now extensive. As dryness of air and soil and altitude, with its modifying influence on temperature and climate generally, are the conditions most favourable to the phthisical invalid, I would advise Dr. Reynolds's patient to go with as little delay as possible to a high-lying inland locality having a couple of ranges of mountains between it and the sea to intercept moisture; the beauties of such suburbs of Cape Town as Wynberg often tempt people to waste valuable time. The summer at the western side of the Cape is dry as regards rainfall, so that an invalid may spend some time at Cores, a village 1500 ft. above sea level, pleasantly situated at the head of a very fine pass, and where, I believe, comfortable accommodation may be obtained; or Matjesfontein

may be reached in a few hours—it is 2000 ft. above sea level, in the midst of a dry, arid, uninteresting country, but on this very account very suitable. The train on its way thither passes through some beautiful scenery, and when it winds its way up through the Hex river mountains the scenery approaches in grandeur that of the St. Gothard Railway. As to a permanent place of residence, I think Bloemfontein or Allwal North would yield the best results. Both can be reached by rail from Cape Town, Port Elizabeth or East London. If the traveller should elect to go on by steamer to Port Elizabeth—perhaps, on the whole, the best route for a lady—then a good and very pleasant course to adopt would be to go on to Grahamstown (1760 ft. above sea level)—a town with agreeable and cultured society, a centre of clerical, legal and scholastic life, with pleasant environments and with much altogether to make colonial life enjoyable. There a sojourn might be made; but though I know *poitrinaires* who, driven from England, have found a suitable home there, the climate is scarcely dry enough for some invalids, the relative humidity being 72 per cent. and the rainfall about thirty inches. If found unsuitable a move to Bloemfontein or Allwal North could be easily effected. Bloemfontein (4500 ft.) has a very dry air, the mean relative humidity being only 54 per cent., the mean maximum temperature for the year being 76° F., and for the four warmest months 85° F., and the mean minimum temperature for the year 46° F. The rainfall averages twenty-one inches, chiefly falling as thunder showers. Bloemfontein is the capital of the Orange Free State, and has much improved of late years as a place of residence. Allwal North (4300 ft.), on the Orange River, has a similar climate to that of Bloemfontein. It has sulphur baths in close proximity. I have sent patients to both these places with excellent results. It is most desirable to have accurate records of the condition of patients sent to these health resorts, and in addition to other clinical records, such as history, symptoms, physical signs, temperature, &c, to note whether tubercle bacilli are present in the sputum, as there is much need of a collection of trustworthy facts as to the effect of these high and very dry inland climates on the undoubtedly phthisical. I have had some patients in whom the disease advanced during a residence at Davos, and who improved greatly on these inland plateaux; but this climatic treatment is by no means uniformly successful. Concerning the high day temperature, a colonist once aptly remarked, though the remark savours of the Emerald Isle, that the thermometer has nothing to do with making the heat. He meant that the sensation of heat bore no constant relation to that registered by the thermometer. A moderate temperature (say 76° F) with much moisture in the air is depressing, whilst a temperature of 90° F. with very dry air may be borne with less discomfort. From my experience of the climates of the Riviera, of Italy and of the Cape I can verify this.

I am, Sirs, yours faithfully,

Folkestone, Sept. 5th, 1892.

J. A. ROSS, M.D.

### A DRAINAGE SYSTEM.

To the Editors of THE LANCET.

SIRS.—A new system of drainage is about to be introduced into our town, and I fear the result may not be altogether successful, as a great many of the houses are old and the majority, both new as well as old, are built with the least possible amount of attention to sanitary details. I shall therefore be greatly obliged if you can supply me with the following information, or tell me where I can obtain it:—1. A list of towns recently drained afresh where the new system has proved a failure, and the causes of failure. (Dr. Buchanan's ninth report to the Privy Council I have heard of.) 2. If houses with their internal arrangements in an insanitary condition be connected to the new system (which will include some of the old), is there not considerable danger of sewage contamination through those houses? 3. Can a rural sanitary authority compel owners or occupiers to have their properties put into complete sanitary order before allowing them to connect with the new system? (Section 21 of the Public Health Act seems to imply that this cannot be done.) 4. Can a rural sanitary authority have a set of by-laws relating to the details of the sanitary arrangements of new buildings. If so, where can an efficient set be obtained as a model?

I am, Sirs, yours truly,

Aug. 27th, 1892.

B. N. T.

\* \* 1. We cannot find any mention of the subject in the Report of the Medical Officer to the Local Government Board mentioned by our correspondent. We doubt whether any such list as that asked for could be obtained without wading through the reports of inspections of towns made by the Board's officers through a series of years as occasion required.—2. This question is too vague to admit of a fair answer, as it neither specifies the kind of drainage already in use nor the new plan to be adopted. Houses drained by the water-carriage system, and either badly connected with the sewer or having leaky points and other sanitary defects, would necessarily be dangerous to health.—3. The rural sanitary authority has not the power to compel owners to put their properties into thorough sanitary repair before connexion with the sewer, unless a nuisance can be proved to exist. The rural sanitary authority can only insist that the connexion with the sewer is made to their satisfaction.—4. The power of making by-laws respecting new buildings is by Section 167 of the Public Health Act (1875) conferred on the urban sanitary authority alone; but by Section 16 of the Local Government (England and Wales) Act of 1883 the County Council is given the same power of making by-laws in relation to their county, or to any specified part thereof, as the council of a borough.—ED. L.

## THE CAPE COLONY LEPROSY REPRESSION ACT.

WE have received from South Africa a letter addressed to us by Dr. Cartwright Reed on the above subject. This communication is too long for us to publish it in full. But our correspondent concludes his letter by giving a summary of its contents, which, we think, fairly well convey the chief points dealt with by him in his letter. This is the summary:—

"(a) There is nothing that I am aware of before the public to explain the long delay between the passing of the Act and its proclamation in the *Gazette*. (b) That the information in the hands of the Colonial Government as to the probable extent to which leprosy exists in the territory is by no means reliable. (c) That there should be provided local detention houses—Robin Island Asylum being unreasonably far from where many sufferers live—in which the feeble could be properly segregated and cared for. (d) That special provision will have to be made for the removal of these cases by road and rail, involving great precautions, and provisions for disposal of contaminated dressings &c. or disinfecting appliances provided, before such matter can be disposed of through the carriage window or door. If all this and much more cannot be done, then abandon this one asylum scheme and provide area lazarettos. The cost of this proposal would, if anything, be less than that at present before us. Certainly, much bodily suffering would be avoided, the danger to the public health reduced to a minimum, and the parting between the sufferers and their relatives or friends shorn of its bitterest pangs. Lastly, would it not be wiser for 'boards of medical men'—say two—to examine the alleged cases, and then to certify for their removal or otherwise, following lines laid down by our lunacy laws. Your opinion upon this would be much valued, because in this colony many outlying districts are provided with young practitioners who have little experience in these matters."

With regard to the point upon which Dr. Cartwright Reed asks us to express an opinion, we have only to say that we do not imagine it to be possible that the Government of Cape Colony would permit any person to be treated as a leper, within the meaning of their Act, until his condition of disease had been examined and reported upon by more than one efficient medical authority.

*Delta*.—The matter depends on the wording of the agreement or articles defining the partnership, on which a solicitor's advice should be taken.

*Nemo*.—Gowers' "Diseases of the Nervous System," vol. 1.

*Mr. Sydney R. Lidiard* (Hull) is thanked.

## LEPROSY IN BRITISH COLUMBIA.

To the Editors of THE LANCET.

SIRS,—I enclose you a clipping from the *Daily World* of this town, dated Aug. 16th. Perhaps it may be of interest to your readers, and may account for the reappearance of leprosy in England. This is not the only case which has developed among the Chinese residents in this colony; and as in packing the canned salmon Chinese labour is employed entirely, and the fish is brought in direct contact with any disease they may have, does not a danger exist of spreading contagion?

I am, Sirs, yours truly,  
J. F. WELLS, M.B.

Vancouver, British Columbia, Aug. 16th, 1892.  
"Victoria, B.C.—Lee Sing, a resident of Chinatown, was found this afternoon suffering from leprosy. He says he worked in a Fraser river cannery last year and had the disease then. His forehead and jaws were covered with round whitish swellings, which keep the imprint of the fingers like putty when they are pressed. The odour from the victim was very offensive. He has other symptoms of the disease. The civic and provincial health authorities informed me that it is likely Sing will be sent to the Darcy Island lazaretto to-night or to-morrow. The case caused some excitement, and will probably lead to a general examination of all the Chinese in Chinatown."

*Dr. A. B. Harris* (Falmouth).—We consider it a good custom, not only with regard to cholera but for other diseases, such as scarlet fever, diphtheria and typhoid fever, to scald the milk on its reception in a household. It is not only the milk itself that has to be considered, though its digestibility is rather improved than otherwise by the process in that the caseine is split up and more finely divided, but it is sometimes adulterated by the addition of water, which cannot very well be added to butter or cheese.

*R. H.*—A short hopper closet, provided with a separate cistern capable of discharging three gallons of water as a flush after each use.

*Mr. E. T. Wynne*—The paper will shortly appear.

*Aggression* has not enclosed his card.

## BALDNESS AND ITS TREATMENT.

To the Editors of THE LANCET.

SIRS,—In the instructive annotation upon the above subject, at page 870 of your issue of the 13th ult., the great value of the percutin in restoring the growth of the hair is not mentioned. Five years ago I drew attention to this powerful agent ("Medical Digest," Section 21-0) and since that time I have had many cases, of all ages and both sexes, that confirm the observations then made.

I am, Sirs, yours obediently,  
Boundary-road, N.W., Sept. 7th, 1892. RICHD. NEALE, M.D. Lond.

## PUBLIC VACCINATION AND SMALL-POX.

To the Editors of THE LANCET.

SIRS,—A *propos* of your remarks on this matter in THE LANCET of Aug. 27th, p. 490, and in corroboration of the same, I will give an incident that happened only yesterday to myself, whilst acting in my capacity of public vaccinator.

Amongst my cases that came up to be examined was a baby of about four months old, whose arm had taken in only two places. I told the mother it was not sufficiently protected—I always make four punctures—and advised its being done again. She was most indignant, and said she should not have it done any more, for "she could go to a chemist and get it done for one shilling by a doctor who would only do it in two places." I am informed that it is the practice of some to do only one place, and that is called successful vaccination and certified as such, the mothers thinking that by paying their shilling or half-crown they can and do persuade the medical man to perform the operation in this fashion. The statistics of the small-pox hospitals distinctly prove that the successful termination of a case is in direct proportion to the number of marks a patient can show. I should be very sorry to condemn the whole profession; but that this does take place occasionally the above incident shows, and goes far to prove the truth of Mr. Horder's remarks.

I am, Sirs, yours very truly,

Aug. 20th, 1892.

A PUBLIC VACCINATOR.

## THE DEATH CERTIFICATE.

To the Editors of THE LANCET.

SIRS,—A letter in THE LANCET of Aug. 27th criticises the wording of death certificate forms. Let me point out a present danger. I am attending a case of heart disease. I have not seen the patient for three months, but the friends come to the surgery and get medicine for her. Should she die suddenly to-morrow the friends would no doubt ask me to visit the body and give a certificate. In such a case an average medical man would be much tempted to save the relatives the annoyance of an inquest, especially as he could truthfully fill up the certificate. This might sometimes give an opportunity for the concealment of crime, to prevent which is the object of death certificates. This particular danger would be avoided if the forms read: "I last saw h—alive."

Aug. 27th, 1892.

I am, Sirs, yours obediently,

G. P.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

COMMUNICATIONS, LETTERS, &c., have been received from—Messrs. Allen and Son, Marylebone; Mr. Aitchison, Wallsend-on-Tyne; Mr. Edouard Anguetil, Tavistock; Mr. Ashby-Belbin, Sheffield; Messrs. Armour and Co., London; Mr. Abbott, Exeter; Dr. Baker, York; Dr. Sydney Bontor, Herts; Mr. A. Brown, Switzerland; Messrs. Burgoyne and Co., London; Mr. Barford, Bracknell, Herts; Messrs. Bishop and Sons, London; Dr. Brock, London; Mr. Brohn, London; Mr. A. G. Bateman, London; Mr. Bourke, co. Tipperary; Mr. T. B. Browne, London; Mr. Blackwood, London; Mr. Branthwaite, Twickenham; Mr. Byrne, London; Dr. Croke, Beverley; Messrs. Clarke, Son and Platt, London; Mr. J. G. Campbell, Belfast; Messrs. Crossley and Co., London; Mr. Cooke, London; Mr. Clarke, London; Messrs. Canton and Co., London; Mr. Carters, Liverpool; Dr. Charteris, Glasgow; Mr. Cooke, Worcester; Mr. Carter, Masham; Mr. T. Cooke, London; Mr. Calvin, Manchester; M. Durand, Paris; Messrs. Easor and Son, Dublin; Dr. Jas. Edmunds, London; Dr. H. L. Evans, Reading; Mr. G. S. Farquharson, Southampton; Mr. F. Hurry Fenwick, London; Mr. Gordon, Witheridge; Mr. Graham, Wolverhampton; Mr. Hornbrook, London; Dr. A. H. Hart, Suez; Mr. W. Huntingdon, N.B.; Mr. Heywood, Manchester; Messrs. Hopkinson and Co., London; Mr. Hording, Oxford-street; Mr. A. W. Hewett, London; Dr. G. E. Hale, London; Dr. J. Herschell, London; Mr. Chas. Holmes, London; Mr. Ingle, Jersey; Mr. Jones, Melbourne; Mr. Jesse, Macclesfield; Mr. E. B. Knowles, London; Dr. Kerr, Falls City, U.S.A.; Sir T. Longmore, Swanage; Dr. W. J. Little, Ryarrh; Messrs. Lee Bros., Philadelphia; Mr. W. Layton, Antwerp; Messrs. Lee and Nightingale, Liverpool; Mr. Lewis, Rainhill; Messrs. Moulton and Co., London; Mr. J. A. Marston, London; Messrs. Mitchell and Co., London; Mr. Martin, Manchester; Messrs. Macmillan and Co., London; Dr. Milton, Cairo; Dr. Maxwell, Woolwich; Mr. Ernest Miles, Broadmoor; Mr. Morrison, Glasgow; Mr. A. E.  UNIVERSITY COLLEGE HOSPITAL.—Operations, 2 P.M.; and Skin Department, 9.15 A.M.

SUBSCRIPTION.

POST FREE TO ANY PART OF THE UNITED KINGDOM.

One Year ..... £1 12 6 | Six Months ..... £0 16 8

TO THE CONTINENT, COLONIES, UNITED STATES, INDIA, CHINA, AND ALL PLACES ABROAD ..... One Year 1 14 8

\* \* In consequence of the new postal arrangements, the Annual Subscription for India, China, and all foreign countries will now be reduced to £1 14s. 8d., instead of £1 16s. 10d. as formerly.

! Post Office Orders and Cheques should be addressed to The Publisher, THE LANCET OFFICE, 423, Strand, London, and crossed "London and Westminster Bank, St. James's-square."

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only a ready means of finding any notice, but is in itself an additional advertisement. Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance. Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET. Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 66, Rue Caumartin Paris.

# EXCELLENCE IN PHARMACY.

## Blaud's Pill in "Tabloids."

(Four grains.)

The CHEMIST AND DRUGGIST, Sept. 10th, 1892, reports:—"The ingredients of a four-grain Blaud's Pill are combined in the 'Tabloid' without excipient, providing a cream-coloured mass. The first thing that strikes one about these 'TABLOIDS' IS THEIR SMALL SIZE COMPARED WITH THE USUAL BLAUD'S PILL, but we have found that the average weight is between  $\frac{1}{4}$  and  $\frac{1}{2}$  grains—a commendable degree of accuracy we should say. The colour of the 'Tabloids' is due to the fact that the alkaline carbonate and ferrous sulphate are prevented from reacting until a 'Tabloid' is brought into contact with water, when the characteristic pea-green ferrous carbonate is produced. In air-free water the carbonate is but slightly coloured, showing that the ferrous salt is remarkably free from oxidation. We have also noticed that by gentle friction the carbonate which is first formed comes off, and immediately the white surface below assumes a green colour. Hence it may be expected that assimilation of the iron will proceed steadily, without unduly neutralising the acid contents of the stomach."

The BRITISH AND COLONIAL DRUGGIST says:—"From their form and size these 'Tabloids' can be administered to the most fastidious, and can be taken in any number without the slightest difficulty."

Ferruginous "Tabloids" (Blaud's formula), 4 grains, are supplied to the Medical Profession in bottles of 25 and 100 at 9d. and 1s. 6d. each.

## Soloids of Hydrarg. Perchlorid.

Readily soluble without crushing, are of a different shape to "Tabloids," thus preventing mistake. These Soloids are affirmed to be most convenient for the prompt and accurate preparation of antiseptic solu-

tions for obstetric and surgical work. ONE SOLOID DISSOLVED IN A PINT OF WATER MAKES A SOLUTION STRENGTH 1 IN 1000.

Soloids are as carefully made as "Tabloids," the quantity of the Perchloride being accurately gauged for each Soloid.

Soloids of Hydrarg. Perchlorid. are supplied to the Medical Profession in bottles of 25 and 100 at 9d. and 2s. each.

## Arsenite of Copper "Tabloids"

in  
CHOLERAIC AND ENTERIC DIARRHŒA.

Dr. Boardman Reid found this remedy of the greatest value as an *antispasmodic* in CHOLERA MORBUS and COLIC when given in minute doses (one "Tabloid" = 1-1000 grain) every hour until relief is obtained. In all cases where "Tabloids" were employed "relief was rapid and complete." It was observed that when other preparations of the drug were given results were not so satisfactory. The "Tabloids" were perfectly soluble in water; other compressed pellets would not dissolve, thus, it is said, accounting for the failure of the remedy.—(NEW YORK MEDICAL TIMES AND REGISTER, Dec. 6th, 1890, and BRITISH MEDICAL JOURNAL, Jan. 24th, 1891.

Numerous cases of Chronic Diarrhœa and Enteric Diarrhœa successfully treated by this remedy are reported in the THERAPEUTIC GAZETTE, Jan., 1891, and Feb., 1891.

It also afforded prompt relief in the *after pains of labour*, "which entirely resisted all the usual remedies."—BRITISH MEDICAL JOURNAL, Jan. 24th, 1891.

Arsenite of Copper "Tabloids," Triturated, SOLUBLE, supplied in bottles, each containing 100, for dispensing.

*Specimens sent post free to Medical Men upon request.*

"Tabloids" are dispensed in any quantity by all Chemists with plain manuscript labels.

Physicians are respectfully requested to append the initials "B., W., & Co." after the formula in their prescriptions; this prevents worthless substitutes being dispensed, and indicates to Chemists in out of the way places where the article can be obtained if not already in stock.

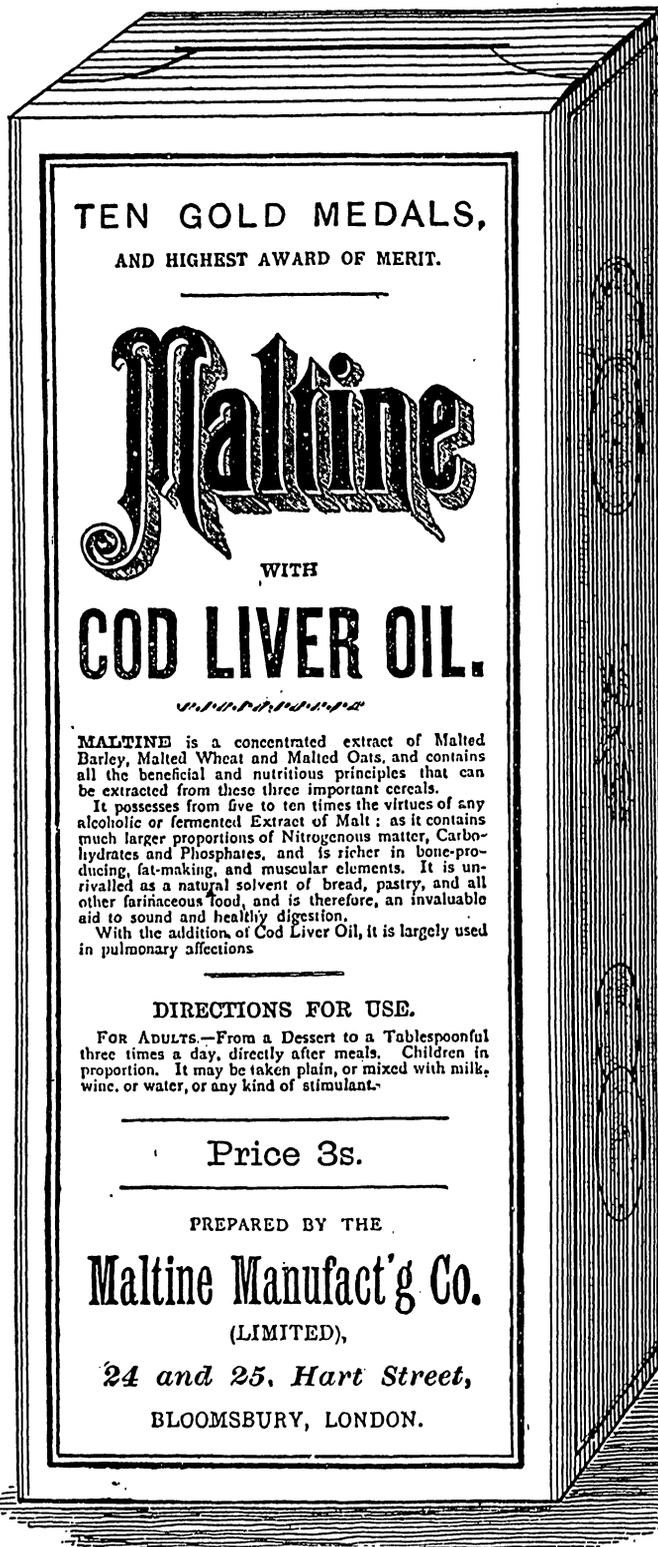

**BURROUGHS, WELLCOME, & CO., SNOW HILL BUILDINGS, LONDON, E.C.**

# THE BEST FORM OF COD LIVER OIL.

"THE therapeutic value has been so thoroughly recognised, and is so well known." — BRITISH MEDICAL JOURNAL, Report on Maltine with Cod Liver Oil.

The great nutritive value of Maltine with Cod Liver Oil is due to the combination of albuminoids, fats, and carbohydrates in an easily assimilable form.

The convenient, semi-liquid consistence and agreeable flavour of the Maltine, together with its richness in the digestive ferments, are advantages that have led to its adoption by the Profession as the

ideal menstruum for Cod Liver Oil.

A Medical Man writes:—

"The Maltine c. Ol. Morrhuæ I have found particularly valuable. I tried it with a patient who is quite worn down with Leucorrhœa and frequent miscarriages. She has failed to take Cod Liver Oil in any shape before, and other combinations of malt and oil were also rejected despite many attempts. Your preparation agrees very well with her, and she feels benefited by it already."

## MALTINE WITH COD LIVER OIL

Is Unrivalled as a Food in Phthisis, Scrofula, and Rickets, and is found most useful in convalescence from Acute General Disease, in Chronic Inflammations, and in the sequelæ of Acute Specific Disease.

WE SHALL BE PLEASED TO SEND SPECIMENS FREE OF CHARGE TO MEDICAL MEN.

ABSTRACT OF THE

*Hunterian Oration.*

*Delivered before the Hunterian Society,*

By CHARTERS J. SYMONDS, M.S., M.D.,  
F.R.C.S. ENG.,

ASSISTANT SURGEON TO GUY'S HOSPITAL AND LATE SURGEON TO THE  
EVELINA HOSPITAL FOR SICK CHILDREN.

MR. PRESIDENT AND GENTLEMEN,—When invited by the Council to address you to-night I deemed it my duty, in order the better to fulfil the purpose of this annual Oration, as well as to show my sense of the honour conferred on me, to study the life and writings of John Hunter. I conceive it to be one object of this Oration to show how the work and life of others may animate our own and stimulate us to higher aims. In this sense I have endeavoured to read the life of him whose birth, 134 years ago, we commemorate to-night. An able biographical sketch formed the subject of so recent an Oration that I propose to confine myself to the influence of Hunter's work and to his personal influence. In order to appreciate the effect of his work it will be necessary first to study the position of surgery before his time, in the writings of those who preceded, those who taught him, and of those who were his contemporaries. Next I propose to discuss Hunter's own work and more particularly his method; to note, but only in a very general way, how this teaching differed from that of his predecessors. Then to observe the effect of his teaching on those who followed him, and to ask what was the attraction of Hunter for those who became themselves celebrated men. Finally, to note the personal influence of Hunter and to a certain extent to ask what kind of man he was.

In the earliest times medicine had reached in the hands of the Greeks and Romans a point of great usefulness and importance, and 200 years before the Christian era the Alexandrian school was flourishing. Here dissections were practised and with its famous library every advantage was afforded for developing the scientific study of medicine. It was here that the practice of medicine was separated into three parts and each part assigned to a different person, one of whom was supposed to cure diseases by compounds of drugs and other substances, another by regimen and plans of diet, and the third by manual operations and instruments. This division was not maintained, for the accumulation of knowledge did not admit of it, and the dark period which followed led to medicine being treated as a whole by succeeding writers. Had the Alexandrian school continued, in all probability the separation of the two parts, at least of physic and surgery, would have widened, as it did in the revival of learning. Unfortunately for scientific pursuits, early in the fifth century the northern hordes swept over Europe, and in the seventh the Mahomedan power conquered Palestine, Egypt, Northern Africa and penetrated into Spain. The darkness that followed affected all learning, and the knowledge of books and of the arts remained in Italy, where the Roman withstood the tide of conquest. Here the priests and monks formed the educated class, and, being able to read the Greek and Latin authors, acquired a knowledge of medicine, and for centuries the practice of physic remained in the hands of the clergy. The Arabs in Spain established a famous school of learning, including medicine, in the eleventh century, and here the older authors were translated into Arabic. It is interesting to notice that the Jews understanding this language obtained a great ascendancy in the practice of medicine. Though laws were passed and Papal edicts issued rendering it penal for a Jew to prescribe for a Christian, yet in every court a physician belonging to this race was to be found. In the year immediately preceding the Norman Conquest a stimulus was given to the study of medicine by the medical schools at Salerno, Naples and Montpellier, which were frequented by students from all parts of Europe. The Salernian School in the eleventh century conferred a licence to practise as a physician and as a surgeon. In reference to surgery the statute was "that the person examined must be twenty-one years of age, and must bring testimonials of having studied physic for five years; if to be admitted in surgery, he must learn anatomy

for one year; he must swear to be true and obedient to the society, to refuse fees from the poor, and to have no shares of the gains of the apothecaries." A critical writer of the twelfth century observes that the students return full of flimsy theories, quoting Galen and Hippocrates. They have two maxims which they never violate: "Never mind the poor; never refuse money from the rich." So lucrative did the priests find the practice of physic that they neglected their monastic duties and incurred the displeasure of the Pope, who, looking upon the manual part as derogatory, issued a decree interdicting the priests from performing any surgical operation whatever. They, however, anxious to retain a hold on this branch, employed their servants, the barbers who shaved their heads, to perform a like office for their patients, before applying external remedies. Then "finding these fellows handy with edged tools, the priests taught them to bleed and perform the minor operations, as well as to make salves and poultices and to dress wounds and sores." Hence arose the barber-surgeon. It will be seen that the separation of physic from surgery was first due to an edict of the Pope, the final separation taking place at the end of the fourteenth century. The priests were at length compelled to relinquish the practice of physic, which passed into the hands of some of the learned of the laity, who could read the Latin and Greek authors, while the barbers formed themselves into a fraternity of barber-surgeons. Thus we see that the physician has ever been the scholar; confident in his superiority, we find him despising his less learned brother. The better of the barber-surgeons soon separated themselves from the barbers, and became very early a company of surgeons. In London there were many struggles between the two divisions of the barber-surgeons and surgeons; the former were incorporated as a company, while in 1421 the surgeons and physicians united for the purposes of improving the state and position of both branches of the healing art. Unfortunately, the union was short lived, and the separation gave rise to mutual jealousies and troubles which lasted over three hundred years. So late as 1632 the physicians obtained an Order of Council that no surgeon should trepan, cut for stone, or perform any large operation unless a physician were present, and yet they declined to examine in surgery. This edict was withdrawn in three years. Even after the first separation of the surgeons from the barber-surgeons in 1744, the surgeon was still not allowed to prescribe internal remedies; and in Hunter's time the physician's name appeared on the bed-letters when more than a black draught was ordered. Abernethy did much to remove all this, and so did Cheselden. It was, on the part of the surgeons an earnest of their desire to improve the position of their art at any sacrifice that they took with them only the Aris and Gale bequests, leaving the barbers the hall and plate. Pott and Hunter were appointed the masters of anatomy at the new hall of the surgeons in the Old Bailey in 1753. Even in some of the early Hunterian Orations—and the first was delivered in 1814—several apologetic remarks occur, indicating that the surgeon in assuming a foremost position for his branch, was careful to avoid slighting the physicians. The preceding sketch shows that it was only just before Hunter's time that the surgeons were placed on an independent basis. It was not till 1800 that the charter constituting the company into a Royal College was granted.<sup>1</sup>

[The orator then gave a sketch of the writings of Cheselden, Sharp, Warner, Blomfield and Pott, the immediate predecessors and contemporaries of Hunter.]

A sharp and well-defined line is reached when we examine the writings of the great physiologist and surgeon who forms the subject of our study to-night. For the first time we read of surgical principles, and have described to us how the processes of disease must be studied through those of health. The men of his own time pass away almost forgotten, Pott alone remaining, and we see a new era—a Hunterian era—arise. It seems inconceivable that in the lifetime of one man so much could be accomplished, and we of the present day cannot realise that many of the pathological laws which we discuss with so much familiarity were worked out by Hunter, and that, too, by his unaided efforts. The one from whom Hunter learnt most was undoubtedly his brother William. "It was under his tuition and patronage that the more peculiar talents of his brother were first elicited and cherished, and to his example and instructions we are greatly indebted for many of the advantages which have since flowed down

<sup>1</sup> The above is taken from Rivington's "Medical Profession," South's "Craft of Surgery," and Abernethy's Oration.

through others to us. . . . That Hunter acquired the best physiological knowledge of the time from his brother's lectures cannot be doubted, but he was not satisfied without examining for himself and forming his own conclusions." Not satisfied with Haller, he searched for every fact belonging to the subject he was investigating to form the basis on which he reasoned, and Abernethy, who is his best interpreter, says "he finds no inference deduced from insufficient or irrelevant premises." Hunter himself tells us, in the introductory chapter to his work on the blood and inflammation, that he compiled the work from notes made in the course of twelve years' residence in London. During this space, he says: "My time was occupied partly in my education under the late Dr. Hunter and partly in assisting him. In the winter session I was principally employed in the dissecting-room, where I taught the practical part of anatomy; in the summer I attended the hospitals." The *European Magazine* for 1792, an extract from which is appended to Abernethy's work, contains an account of Hunter's lectures, and as the editor assured Abernethy that he had the information from Hunter himself, we may look upon the account in the light of an autobiography. From this we learn "that his purpose is to give a comprehensive view of the system and investigate the principles upon which the practice of surgery is founded—viz., to show the actions of the body and its parts when in the diseased state with the actions and effects of nature to recovery, and the necessary and proper assistance to be given to the surgeon." Again: "He (the surgeon) ought not only to know the whole of one simple action, or the knowledge of all the actions singly, but he should ascertain their correspondence, mark their relations and acquire a competent idea of the compound actions and general fabric of the machine. Mr. Hunter, having observed that the greater part of the books published on Surgery contain little else than relations of cases and modes of treatment, and that the practitioners have been too easily satisfied with a collection of facts without embracing the catalogue of diseases as a system, proposes in his course to examine the theory and principles of diseases in a regular series. His ideas, his mode of reasoning, as well as his arrangement of diseases are new, and he therefore has received little aid from books or from other professors. The novelty of his ideas occasions also the application of new terms, and those which he has given he may consider as clear and explanatory, since they are adopted by others and brought into use." From 1760 to 1763 Hunter was with the army on the Continent, whither he went to recruit his health, which had suffered from the assiduity with which he had prosecuted his inquiries into the anatomy of the lower animals. On his return he began teaching in order to obtain an income, and from this time to the day of his death he taught regularly and, indeed, never appears to have left London unless compelled to do so for the restoration of his health. In 1773, when he was forty-five, he began a course of lectures in St. George's Hospital. These he relinquished in 1792, handing over to his successor (Home) his manuscript, with notes on the fly-leaf of the specimens he employed for illustration. These original lectures were never published, nor did Home preserve them, but, for reasons best known to himself, they were destroyed, with many even more valuable writings. Happily, among the many who listened to Hunter there were some who took careful notes, and from those made in shorthand by Mr. Rumsey the able editor of Hunter's works—Mr. Palmer—has compiled the lectures. During his lifetime he did not publish any important surgical works, though that on Inflammation was partly through the press at the time of his death and was published in the following year. In this masterpiece we have his mature opinions, criticised from year to year by himself, and by many generations of pupils. Of this work Hunter tells us in the introduction that it was partly composed thirty years before, when he was with the army before Belleisle. "It ought to be considered as a new figure, composed from rough materials, in which little or no assistance could be had from any quarter." This work, there is every reason to believe, was eagerly read by the leading men of the time. We find, for instance, Abernethy saying: "I know of no book to which I can refer a surgical student for a satisfactory account of those febrile and nervous affections which local disease produces except that of Mr. Hunter." I think to those who have passed from the period of studentship that part of the work which deals with the pathology of inflammation will be found as instructive to-day as it was in the time of which Abernethy speaks. For instance, he defines inflammation as "an increased action of that power which a part naturally possesses, and in healthy

inflammation at least it is probably attended with an increase in power; but in inflammation which terminates in mortification there is no increase of power, but, on the contrary, a diminution of it." He means by power, I take it, the ability of the part to direct the processes of health, and in disease the controlling influence over the action or life of the part. So long as the power is capable of directing the processes the course of the inflammation will be conducted to the advantage of the part, as in the union of wounds; but when the ruling and guiding influence is overbalanced and conquered, then action, or rather overaction, having its sway a destructive termination results; or, as Hunter puts it, "a diminished power, joined to an increased action, becomes a cause of mortification by destroying the balance which ought to subsist between the power and action of every part." In these remarks on the power of resistance we are reminded of the latest discoveries in the pathology of cell action—I mean the attractive views on the phagocytic action of leucocytes. It is a good example of what is to be noticed all through his work; he is always suggestive. As you know, it was not until many years later that the part played by the cells was shown, and not till later still that the influence of bacilli and other destructive agents was discovered to be the cause of the inflammatory processes. Hunter, however, recognised that "there are causes of mortification preceded by inflammation, which do not arise wholly from that as a cause, but rather seem to have something in their nature, and of this kind is the carbuncle." Thus, as I have mentioned above, does he point out the differences, and, without attributing the variation, as the older writers would have done, to evil juices and spirits, at once directs the thoughts of others into the appropriate channels of discovery. He is still more instructive when he speaks of the treatment of mortification. "If," he says, "this account of mortification arising from no specific nature be just, we shall find it no difficult matter to establish a rational mode of cure." He objects to the too liberal use of wine because of the depression that follows, and as to local measures, he advises the greatest discrimination. The criticisms on the method in vogue show that he wished to teach only from general principles founded on pathology. He says: "Upon the principles here laid down the bark is the principal medicine as yet known that we depend upon, as it increases the powers and lessens the degree of action. Upon many occasions opium will be of singular service by lessening the action. Although it does not give real strength I have seen good effects from it, both when used internally in large doses and when applied to the part. It is proper also to keep the parts cool and all the applications should be cool."

I have given this lengthy extract because it affords a good example of his method of dealing with treatment, a method that no one used before. He leaves his readers to work out for themselves the details. Let us for a moment recall that when Hunter was teaching in this way there was no other lecturer in London who attempted a similar method; indeed, there were some who thought that in his investigations in anatomy and physiology he was wasting time. A colleague at St. George's, when asked to join in giving a series of lectures, replied that he did not think that the art could be improved. So much at variance were many of the men of his time with his teaching that Hunter was not unfrequently much annoyed at the opposition he encountered. Had not his views proved by the progress of our knowledge to be correct this remark would only show an irritable state of mind, and an arrogant one too. Listen, however, to one who heard him lecture and who knew him well—Abernethy: "He seemed to me conscious of his own desert, of the insufficiency and uncertainty of his acquirements, and of his own inability readily to communicate what he knew and thought. He felt irritated by the opposition he had met with in establishing his opinions, and still more by finding, when he had surmounted this difficulty, that these opinions were, by the malice of mankind, ascribed to others. All which, I think, may be fairly inferred from a single sentence he one day addressed to me: 'I know, I know,' he said, 'I am but a pigmy in knowledge, yet I feel a giant when compared with these men.' As disease," he writes, "is a wrong action of the living parts, the restoration to health must first consist in stopping the diseased dispositions and actions and then in a retrograde motion towards health. The alteration of structure by violence requires only the most simple change in the natural action of the part to restore it, and of course the most simple

treatment by art, if it be such as to require any assistance at all, for there are many accidents where none is necessary. It will be proper to observe here that there is a circumstance attending accidental injury which does not belong to disease—viz., that the injury done has in all cases a tendency to produce both the disposition and the means to cure."

Another practical conclusion he draws from the study of the process of union of wounds is so exactly that upon which we insist at the present day that I am induced to quote again—I mean the treatment by rest with dry and infrequent dressings. "If the edges cannot be brought into complete apposition they must unite by another process than the first intention. If kept moist they will inflame as deep between the cut surfaces as the blood fails in union and there suppurate and granulate, but if the blood is allowed to dry and form a scab between and along the cut edges, then inflammation and suppuration of those edges will be prevented, and this will complete the union." Of the influence of rest he writes: "The first and great requisite for the restoration of the injured parts is rest, as it allows that action which is necessary for repairing injured parts to go on without interruption, and as injuries often excite more action than is required, rest becomes still more necessary. Rest is often admitted from necessity, as from the fracture of a leg, but seldom where motion is only an inconvenience." In the accounts of his published cases we read of the first dressing being made on the fourth or again on the seventh day. In the interesting article on "Scabbing" there are many valuable suggestions. He points out the injurious effects of a poultice in a graze of the shin and the value of assisting the formation of a scab. In burns and scalds he also advises the use of flour to hasten the scab formation. In recent wounds we now seal with antiseptic powders, such as boric acid and iodoform with or without collodion, while Hunter employed blood, and in our day, before we used the aseptic gauzes, we were accustomed, like Hunter, to allow the blood to coagulate on the surface in cases of compound fracture.

Such teaching as this marked an immense advance in scientific thought, and we can understand how these views would be welcomed by the younger men. For the first time surgery was taught as a science; the processes of healing and restoration of injured and of diseased parts were shown to depend on the operation of large and fixed laws. He showed, moreover, that there was one pathology for medicine and for surgery; that medicine in its widest sense was one and indivisible, and must be studied as a whole, for no part can be understood if it be studied without reference to the rest of the body. The physician must understand surgery, and the surgeon the medical treatment of disease. When we remember that in Hunter's time a surgeon was not supposed to give internal remedies beyond a black draught, the importance of this welding of the two branches of medicine by means of a common pathology will be appreciated. As we read this great work to-day we feel a glow of interest, we catch the enthusiasm of a man who investigated for himself, who speaks unfettered by authority, who, moreover, tells us truths which we in our time have seen verified; and, withal, we note the great charm of humility and his recognition of the fact that he is but on the threshold of the subject.

It has been said, and it is no doubt true, as Owen pointed out, particularly with regard to the blood, that Hunter was in many things ignorant of the work that had been done by those who preceded him or who were working in the same direction. This led him to find that he had been anticipated by others and gave, moreover, to those who were opposed to him the means of undervaluing his discoveries. But it was not so much what John Hunter discovered as the use he made of his observations in building up his general principles and laws. I think it is not a matter of regret that he worked alone, or almost so, for, already master of human anatomy, his researches necessitated the examination of five hundred different species of animals, exclusive of repeated dissections of different individuals of the same species. To the classification of these he brought a powerful intellect, an indomitable industry, an original method, and working on entirely new lines he drew from his immense collection of facts the general laws and principles to which I have referred. Surgery he raised from a practical art to the dignity of a science, and showed to physician and surgeon alike that in the treatment of disease there was one common principle. Writing on this, one who knew him well says "that which made him so superior to his competitors was his original expanse of thought, his being exempt from that prejudice in favour of ancient authorities which

fetters the youthful mind; it was his steady determination of investigating for himself, his deep scrutiny of every object that came under his inspection, his vigorous intellectual activity." In a manuscript relating to a dissection of a turtle Hunter says: "The late Sir John Pringle, knowing of this dissection, often desired me to collect all my dissections of this animal and send them to the Royal Society, but the publication of a description of a single animal, more especially a common one, has never been my wish." In proof of the important general principles, a knowledge of which Hunter had arrived, Owen quotes the following passage from a description of the drawings illustrative of the development of the chick: "If we were capable of following the progress of increase of the number of the parts of the most perfect animal, as they first formed in succession from the very first to its state of full perfection, we should probably be able to compare it with some one of the incomplete animals themselves, of every order of animals in the creation being at no stage different from some of those inferior orders; or, in other words, if we were to take a series of animals, from the more imperfect to the perfect, we should probably find an imperfect animal corresponding with some stage of the most perfect." "We may, I think," says Owen, "perceive from the evident difficulty with which Hunter expresses the idea that his mind was oppressed with both its novelty and vastness. Men's thoughts require to be familiarised with propositions of such generality before their exact limits and full application can be appreciated." Had he lived to complete the description and arrangement of his museum the large amount of knowledge buried in his records would have received the proper setting from the master's hand. The obscurity of his style has often been regretted, and it has been attributed to the want of education. He did not possess that full acquaintance with our language which would have enabled him to command words with nearly the same meaning, and so to express accurately the idea he wished to convey. But I doubt if the want of education made all this difference; I rather incline to the view that where obscurity exists it is due to the effort he made to draw from an immense crowd of facts a general law. Moreover, his was a new way of dealing with the subject; "and when we remember that his originality of thought and his independence of judgment, leading him to differ from many who had preceded him, had formed a gradual chain of new and extraordinary discoveries, which in a manner exhausted the language of science, we can scarcely wonder at that obscurity in his writings which we have occasionally to lament."

As I have said in an earlier part of this address, the period following Hunter's time stands out in great contrast with that which preceded him, and to his efforts more than to those of any other was this difference due. Equally striking it is to observe the men who followed Hunter and carried on his work and to note that they were his pupils. Amongst the most brilliant were Cline, Abernethy, Carlisle, Astley Cooper, Home and Earle—all men who have left their mark in surgery. It was not his eloquence that attracted an audience, for his style of lecturing was unattractive; he read slowly from manuscript, seldom raising his eyes, and those who wished to learn had to pay the closest attention to follow him through the steps by which he passed to his general conclusions. He seems to have disliked lecturing, but continued to do so for twenty years, considering the annual review in the light of a criticism of his work. His class was small, but there can be no doubt that it contained the best students of the time. His very method of lecturing shows that he was still thinking over the subject, was still criticising himself and correcting what he had written. He attached no value to opinions that could not be based on facts, and as his store of facts increased he would make the necessary alterations in his infernces. To a pupil—Sir Astley Cooper—who asked with surprise whether he had not the year before stated an opinion on some points directly at variance with one he had just put forth, he replied, "Very likely I did; I hope I grow wiser every year." Occasionally he would say to a pupil whom he saw taking notes, "You had better not write down that observation, for very likely I shall think differently next year." Such remarks as this indicate the searcher after truth, and show that he did not consider the subjects he was discussing finally settled. Moreover, he illustrated his lectures from his museum, the most extensive of the time. It was not till after his death that his leading work was published, so that his influence on others was largely due to these lectures; and there can be no doubt that his very hesitation to publish until he could be sure of the truth of his con-

clusions led others to pay particular regard to what he said. He was attractive in another way, in the influence of his great and untiring industry. The effect of this point in his character is well illustrated by an account of a personal interview given by one of the earliest orators at the College—Leigh Thomas : "Upon my first arrival in London, on presenting a letter of introduction from a mutual friend, he desired to see me at five the next morning. Having already the greatest respect for his great professional talents, it may easily be imagined to what height my curiosity was raised by so extraordinary an appointment. No one will doubt my punctuality of attendance. I found him in his museum busily engaged in the dissection of insects. The interest which he seemed to take in his employment, the sagacity of his observations on it, the acuteness of his general remarks upon whatever subject was started, the almost blunt way in which he questioned me respecting my medical education, united to the kindness of his admonitions relative to my future plans, made a very forcible impression on my mind—it was a mingled feeling of profound respect, surprise and admiration." Abernethy says : "It is scarcely credible with what patience Mr. Hunter examined the structure of the lower kinds of animals. He constructed spectacles with glasses of different degrees of magnifying power, so that by a slight alteration of the position of the head he could look through the one or the other. Mr. Clift tells me he would stand for hours, motionless as a statue, except that, with a pair of forceps in each hand, he was picking asunder the connecting fibres of the vessels or parts." This was written of him in the year of his death.

Another reason why Hunter attracted others was the freedom with which he communicated all he knew on any subject. Careful and particular as he was that nothing should be published till it had been subjected to the test of a long criticism, he was free and open in his communication by word of mouth. Indeed, it was by this method more than by his public writings that he diffused his information. "There was," says Norris, "in Hunter an openness and a free communication of such remarks as could interest those of his own profession and consequently mankind." "His candour," says Abernethy, "was evident in all his actions; he readily told all he knew or thought on any subject." "His was that lofty spirit of science," says Chevalier, "which is ever intent on the discovery of truth, and is then most of all delighted when it can effectually assist others in the common labour and duty of us all—the advancement of human knowledge and the alleviation of human distress. It was this which gave to his example and to his efforts for the improvement of his profession that moral and enduring force without which they would have failed of their aim; he was as willing to awaken and to assist the research of others as to prosecute his own. The thing that vexed him most was to see so much to be done and so few disposed to take a part in doing it. It was with a view to form and to develop such useful characters that, in conjunction with his learned friend Dr. George Fordyce, he founded the society called the Lyceum Medicum Londinense for the benefit of students as well as for settled practitioners in every branch of the profession. To this society he gave gratuitous permission to meet weekly during the season in his lecture-room, where he generally displayed for their inspection the most interesting and instructive additions that were made to his museum."

The formation of a society for discussing medical and scientific subjects, referred to in the preceding paragraph, was another means of diffusing knowledge and another proof of the freedom with which Hunter gave to others the result of his works. In 1767 Hunter proposed to a few friends that they should adjourn from the Royal Society to a tavern and discuss the subjects in which they were more immediately interested. Out of this the earliest attempt to form a society for the discussion of medical subjects arose the Lyceum Medicum. "It met weekly in the lecture-room in Leicester-square and was numerous attended by men of general science." This was, so far as I can discover, the same society as that called "the Society for the Improvement of Medical and Chirurgical Knowledge," from which were issued two volumes of transactions, both containing important papers by Hunter. One written by Home from materials supplied by Hunter contains a full account of the operation for aneurysm.

Besides all that Hunter accomplished for surgery, beyond the trouble he took to improve the position of the surgeon, there was in his personal character that which attracted others to himself and to his mode of study. That he was a

genius cannot be doubted by any; that he was a deep and profound thinker is evident, not only from the proofs of this contained in his writings, but we learn it as well from those who knew him. Cline, whose Oration for 1816 was unfortunately never published, but who knew him well, says, "Much as Hunter did, he thought still more—he has often told me his delight was to think"; and, indeed, no one can contemplate the celebrated portrait hanging in the College library without appreciating this side of his character. He is sitting in an attitude of deep reflection, as if about to combine a series of observations into one grand law. His was that kind of genius, however, which was steadied and controlled by a love of truth, by great industry, and, more than all, by a profound humility, not only in regard to his own powers, but also as to the work he had accomplished. His constant saying was, "We are beginning to learn our profession," and though he was aware of the value of his observations, and saw by anticipation the effects they might produce, and was not unfrequently irritated at the unwillingness of others to accept the conclusions at which he had arrived and the truth of which he was able and willing to demonstrate, yet he was often heard to declare that he was not conscious of possessing any peculiar talent, and that if he had promoted professional knowledge it seemed to him chiefly to have arisen from his disposition to distrust opinion and to examine every subject for himself.

With no one else can Hunter be compared more accurately than with Newton. Their methods were much alike. As did his great predecessor, so Hunter, having grasped the great truths of pathology, submitted them to the test of more than thirty years of criticism before he felt justified in giving them to the world with the authority that attaches to a printed publication. To this day many of his laws are as true as when they were deduced. That others have not stood the test of recent advances is but the fate of all forms of knowledge. That which is admitted to be true and wise to-day may, by the advance of time and the progress of science, be compelled to yield to wider knowledge. As the most eloquent of all Hunter's orators—Paget—has beautifully said : "And in this is no disparagement of knowledge. That cannot be despicable which is for the present the best possible, and has in itself capacity for change to a yet better future. But, similarly, that must not be despised which in the past was good, and, though it fell short of the truth, was not wholly erroneous from it; so in estimating Hunter's contributions to the truths and laws of science we must not scorn all those which have not borne unchanged the test of time. It would be as unreasonable to scorn a noble ancestry."

As I have before mentioned, Hunter seemed always delighted to communicate what he knew to others; he did not conceal his designs, and, soliciting the assistance of others, was ever willing to help in return. To young men he gave much assistance and advice, and nothing seemed to please him more than a well-dissected specimen. When Carlisle brought him one day a preparation of the internal ear, Hunter, to whom he was a stranger, immediately gave him a free ticket of admission to his course of lectures. To those in distress he seems to have been generous in an unusual degree, and from this and the amount he spent on his collection he died leaving his family unprovided for. I think from Otley's "Life" we are apt to get the notion that Hunter was rough, abrupt and brooked no other opinion but his own. Mr. Clift, however, in his letter to Sir W. Lawrence, expresses indignation that so many stories by no means true should have been given to the public, and denies, for instance, that the tendo Achillis was ruptured while dancing, but asserts that it took place on rising and stretching himself on his tiptoes after a long period of close dissection—an explanation quite as reasonable as that advanced by his biographer. He was a man, too, "of very considerable humour; his views of subjects in general were very quick and peculiar, and when so disposed he could place them in a very ludicrous point of view." In another place the same writer (Abernethy) says that "he had a great deal of drollery in his composition." And Mr. Clift, who acted as his amanuensis for the last year and a half of his life, tells us "he was mild and kind in his manner, but not servilely courteous to everybody, and, I believe, made no distinction between high and low, great or small." When, after many years and yet without having sought the position by artifice, he had attained to the foremost place in the profession, and "when the abstract acquisitions of his study had become blended with copious experience, he was appealed to by physicians and by surgeons as a final judge upon all unsettled questions in pathology.

And even in the full maturity of experienced wisdom he dispensed his decisions with unabated anxiety and painful solicitude." It would be impossible to conceive a finer tribute to the knowledge, the wisdom and the professional standing of anyone. To be valued by others for careful judgment, founded on a deep knowledge of disease, and also for the care and caution with which the opinion is delivered, is to attain a high position in our profession. In the last year of his life he was still full of scientific work; he would at this time, though over sixty, stand for hours at a dissection "as if nailed to the spot." Such is the character of Hunter, so far as I have gleaned from those who knew him and those who were best able to interpret his mind. Inadequately as I have portrayed the influence of his great mind on the men whom he taught, imperfectly as I have sketched the method he used and the results he attained, I trust that the effect of my work may at least induce others to make themselves acquainted with his writings.

Fortunately for surgery, Hunter applied the results of his investigations to the improvement of practical details. He did more than any man to raise the position of surgery. He perceived that no system of physiology could be perfect that did not explain the morbid as well as the healthy actions of life, and therefore, says Abernethy, "he appears to me as a new character in our profession, and, briefly to express his peculiar merit, I may call him the first great expositor of disease." As I have shown in an earlier part of this address, he was the first to deal with the processes of disease, to show that pathology was a science. "I am," says Abernethy, "old enough to remember the state of surgery and surgeons in this metropolis previous to the general promulgation of the new facts and opinions he added to the stock of professional knowledge, and I believe him to be the author of a great and important revolution in medical science." "Who," he says in another place, "first explained in a physiological and satisfactory manner the diseased processes I have referred to, the formation of abscesses, the secretion of pus, the interstitial and other growths, the cause and occasion of mortification—was it not Mr. Hunter? We now hear no more of those ancient metaphors, concretion and erosion, but we find all the morbid changes accounted for by perverted action of the ordinary powers and structure of parts, clearly perceiving that the same powers and organisation which by the natural and common actions produce health and beauty of appearance do when perverted occasion disease and deformity." Another writer, who for many years was his assistant and who knew him better than anyone, says, in his first Oration at the College: "From the time of Hunter our profession has no longer been confined within the narrow limits of a practical art; assisted by his labours it has acquired a new character, has assumed a more elevated form, and has expanded itself into a science." All the surgery before Hunter was only that of experience; others, as I have shown, wrote well on practical matters, and none better than Hunter's great colleague, Pott; but "with the science and the exposition of principles Hunter alone deals worthily." "Hunter," says Lawrence, "found surgery a mere mechanical art, hardly emancipated from its connexion with the occupation of a barber. He left it a beautiful science, equal to any in attractive interest, inferior to none in its capability of alleviating human suffering." Slowly, as I have sketched in an earlier part of this address, surgery has been improving, and increased facilities were obtained for acquiring a knowledge of anatomy; but the rare combination that occurred in Hunter of deep and scientific thought, with a desire to apply his discoveries to the alleviation of suffering and the progress of surgery, operated to raise the art into a science. Time does not permit my dealing with the celebrated discovery of the means of treating aneurysm and the reasons which led him to suggest this method. It is an evidence of Hunter's belief that what is true will endure, and in the end will prevail, that he never wrote a single line to recommend this operation. The first account was published during his lifetime by Home. In his lectures Hunter, after strongly advocating the method of laying open the sac and of ligaturing the vessel above and below—a method at that time condemned by the majority of surgeons—thus refers to the new operation. Writing in 1786, the year after the operation, he says: "In December, 1785, I performed the operation in a manner different from that usually practised, and with success. The particulars are given in the *London Medical Journal*. I would only observe that in future I would advise only tying the artery in one

part and not to endeavour to unite the wound by the first intention." Such is his brief reference to this great improvement in surgery. There is perhaps no piece of his work that shows more clearly the value of the application of physiology to the practice of surgery than this operation. Hunter connected pathology with physiology, and it is impossible ever to disjoin them. "Before him surgery and physiology were far asunder; no one strong mind had ever deeply studied both and become conscious that both were parts of the same science of living things, and that each might give light to the other and each be a test of the other's truth. This was Hunter's greatest work for surgery. He brought the scientific method into the study of the practice, and he welded scientific knowledge with the lessons of experience."

To quote once more our most elegant and most graceful writer, whose thoughts are ever worthy of the widest circulation: "The influence of such men as Hunter reaches far beyond the time and space of their conscious activity; their true thoughts live after them; their true thoughts not only endure and remain—in the continuity of mental life they really live; they pass on from one generation to another, and in the minds of each succeeding generation they are developed, they grow, they attain more nearly to perfection. Thus, when we honour the memory of Hunter we honour not only that which is passed but that which is still present—a still abiding power of doing good. For Hunter's true thoughts still live in us, and they will live after us and never cease to help and urge men onward in the pursuit of truth. In the world of mind he that is mortal may produce that which may be immortal." (Paget.)

## ON THE DIAGNOSIS OF EXTRA-UTERINE PREGNANCY.<sup>1</sup>

By JOHN W. TAYLOR, F.R.C.S. ENG.,  
SURGEON TO THE BIRMINGHAM AND MIDLAND HOSPITAL FOR WOMEN, ETC.

EXTRA-UTERINE PREGNANCY is a subject which is evidently year by year coming steadily to the front. As a disease or accident it is probably liable to occur wherever normal pregnancy is also met with, and it is not too much to say that every practitioner, even in a country district, has met with or will most likely meet with one or more examples of it in the course of a busy practice. Its mortality is considerable, and its dangers are important, varied and imperative in their demand for recognition and for treatment. The proper treatment of this condition is in most cases no longer doubtful or a question of opinion. The operative removal of the pregnancy when life is endangered is recognised as the only rational course to pursue, and this, when undertaken by those conversant with the practice of abdominal surgery, is being followed by the happiest results. There is accordingly every reason that the practitioner should bear in mind the fact that pregnancy will now and then take place in a wrong situation, and that he should be ready to detect the indications of this. Before, however, we proceed to the signs and symptoms of extra-uterine pregnancy we must briefly consider its morbid anatomy. The large and practical outlines of this are not difficult to understand.

Extra-uterine pregnancy begins in one or other of the Fallopian tubes. If quite at the uterine end, encroaching on the uterus as well as on the tube, so that it is not exactly in either, but rather in the wall of the uterus, it is called "interstitial." In every other part of the tube, at the middle or outer end, it is of course tubal and spoken of as such; but while every extra-uterine pregnancy begins in the Fallopian tube, it does not long remain confined to this situation. As it grows it expands the tube in all directions, separating widely the two layers of peritoneum which form the meso-salpinx or fold of broad ligament in which the tube is contained. In some cases, at present imperfectly understood, it appears as if the coverings of the pregnancy underwent local development commensurate with the development of the pregnancy. Certain it is that a pregnancy which has undoubtedly begun in the Fallopian tube may grow without any definite history or sign of rupture

<sup>1</sup> Read at the annual meeting of the Shropshire and Mid-Wales Branch of the British Medical Association, at Shrewsbury, on June 23rd, 1892.

and proceed to full term as a local intra-peritoneal tumour to one side of the uterus, the child and placenta being contained in a sac the wall of which is entire and of considerable thickness. But this is a rare result. The rule is that as the pregnancy grows the covering of the pregnancy gets thinner and thinner until in some places there is nothing but the one layer of peritoneum between it and the abdominal cavity. Then what happens? Either the pregnancy ruptures directly into the peritoneal cavity with sudden and perhaps fatal hæmorrhage—this not infrequently occurs quite early in the pregnancy—or else the pregnancy takes another direction in its growth. It goes on separating the layers of the meso-salpinx and invades the cellular tissue beneath the peritoneum. But though the evil day of rupture is thereby temporarily postponed it is only rarely averted. Sometimes the child and placenta continue their growth to full term under the peritoneum, being "extra-peritoneal" throughout. More often the peritoneal roof or wall gives way and the pregnancy is precipitated or extruded into the abdomen. If the placenta or its neighbourhood be involved in the rupture the danger of hæmorrhage is again supreme, the rupture causing death unless operative interference save the patient's life. If, on the other hand, the child be uppermost and with or without its membranes, the only part of the pregnancy directly involved in the rupture, it is possible for such a pregnancy to go on, the child remaining and living in the abdomen during the rest of its gestation.

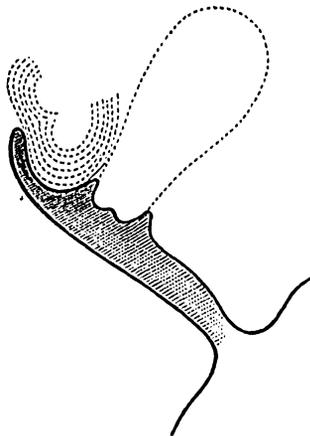

Now, what is the bearing of this on the clinical history of extra-uterine pregnancy? 1. At the beginning of an extra-uterine pregnancy there is of necessity an enlargement in the Fallopian tube—in other words, a "tubal tumour." 2. There is an early period when this is likely to burst before the meso-salpinx and broad ligament can be much invaded by the growth of the pregnancy. This "primary" rupture is apt to occur at the fifth or sixth week of the pregnancy. 3. There is a later period of rupture—a rupture less startling and sudden in its onset; one that happens after considerable opening up of sub-peritoneal tissues; one usually preceded by repeated attacks of sub-peritoneal hæmorrhage and by the formation of a distinct and often visible tumour. This rupture is apt to occur about the third or fourth month, when one half of the pelvis has been filled by the pregnancy, and its further progress is necessarily upwards into the abdomen. 4. In spite of these dangers it is possible for an extra-uterine pregnancy to go to the full term without destruction. Then it may be found (a) enclosed in an intra-peritoneal sac; (b) beneath the peritoneum, extra-peritoneal; (c) more or less free in the abdomen.

From the foregoing sketch it will, I think, be seen that the subject of extra-uterine pregnancy naturally divides itself into three stages—1. The early stage, from commencement of the pregnancy until rupture has occurred. 2. The middle stage, at or about the usual time of rupture (from the fifth to the sixteenth week). 3. The advanced stage, when the child is either viable or has passed beyond the normal period of gestation, and has died for want of birth. Each stage has its own special clinical features and these have now to be described.

1. In the early stage, before rupture of the tube has taken place, the patient usually has the uncertain symptoms of early pregnancy. There is probably slight morning nausea or sickness, with some increased fullness of the breasts, and when the next menstrual period is looked for it does not take place. The patient often believes she is pregnant, and up to this time has no special pain or discomfort that should make her suspicious that the pregnancy is other than a normal one. Very soon, however, irregular hæmorrhage comes on with some pelvic pain, and for these symptoms the patient's medical attendant is likely to be consulted. If a vaginal examination now be made, a tumour can be felt in the pouch of Douglas behind the uterus possessing all the characters of a distended Fallopian tube. It is not very easy to make an exact representation of this in a pencil sketch, but the accompanying diagram, prepared from the examination of cases which have come under my own observation, will show, I think, the leading features of the swelling to be felt by vaginal touch. (Fig. 1.) This swelling is not very sensitive to pressure unless some rupture of the tube has already taken place, and there may be nothing in the general aspect of the case to make the ordinary observer apprehensive of danger. But where you find a history of amenorrhœa followed by irregular loss, together with signs of a tubal tumour in a woman of child-

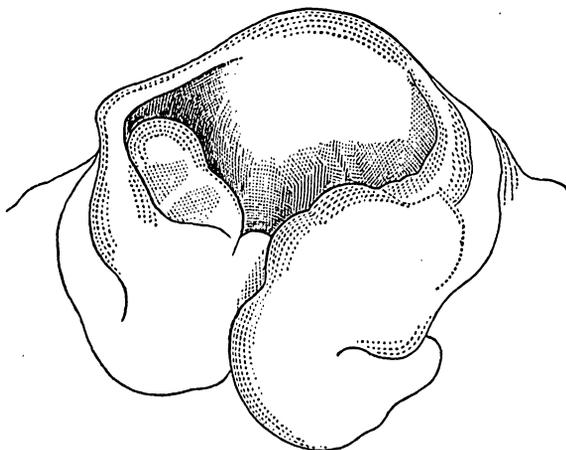

bearing age who has been previously healthy, there is every reason to suspect that extra-uterine pregnancy has begun. If such a tumour as I have sketched be present, how can one be certain that it is tubal? Mainly by a short process of exclusion. The only tumour which exactly simulates tubal distension is the fundus of a retroflexed uterus, and careful bimanual examination should in most cases determine the position of the fundus. If there be a difficulty, and the patient already has some hæmorrhagic discharge, it may be permissible to use the sound as an aid to diagnosis. This when passed will, of course, prove whether the tumour be fundus or not. Small

FIG. 1.

ovarian tumours or enlargements are occasionally found in the pouch of Douglas, but these are never so closely united to the uterus, nor are they so directly posterior in position, as is the tumour formed by a distended Fallopian tube. Some practitioners, whose mental picture of the Fallopian tubes is (unconsciously?) borrowed from the anatomical plates of their student days, have a very real and almost insurmountable difficulty in reconciling this with the position which I have described as characteristic of a tubal tumour, and it may assist these if I append an outline sketch illustrative of distended Fallopian tubes. The pouch of Douglas is the lowest part of the pelvis, and the fimbriated end of the Fallopian tube is its largest part. Consequently, when a tube becomes distended,

FIG. 2.

the heaviest part of the tube tends to fall (as depicted in the accompanying illustration) behind the uterus into the pouch of Douglas, somewhat turning or twisting on its long axis as it does so. (Fig. 2.) I have entered into some detail regarding the features of a tubal tumour, because its presence is not only a most important sign in early diagnosis, but, if rupture be delayed, it is a sign which persists during some months of extra-uterine gestation. The presence of such a tumour is of itself only characteristic of tubal enlargement, and, considered alone, may be due to hydro-salpinx, to pyo-salpinx, to

more or less solid enlargement of the tube, or to tubal pregnancy. It is only when associated with the signs and symptoms of early pregnancy that it becomes really distinctive of early extra-uterine gestation. But in all the other affections of the tube which produce enlargement there is usually a history of inflammatory illness of some duration, and it is therefore of importance to notice that such history of previous illness is absent in extra-uterine pregnancy. The patient usually considers herself quite well until the pregnancy has begun. It was for this reason I mentioned the "previously healthy" condition of the patient as an element in the formation of an early diagnosis. If I repeat the passage, the importance of each element on which I lay stress will, I think, be recognised. "Where one finds a history of amenorrhœa followed by irregular loss, together with signs of a tubal tumour in a woman of child-bearing age who has been previously healthy," there is every reason to suspect that extra-uterine pregnancy has begun."

2. Primary rupture may come suddenly, without any warning, and the resulting hæmorrhage be fatal in a single day. There is, then, no time or opportunity for a careful physical examination, and the symptoms of concealed or internal hæmorrhage must be our guides to action. These are very liable to be mistaken: by a surgeon who has never before had the object lesson of an actual case to teach him, and I need scarcely apologise for detailing in their order those signs which I have noticed as characteristic of internal bleeding of dangerous amount. First, there is increased frequency of pulse without pyrexia. The pulse, which has been, for example, at 80, rises to 100 and continues to increase in frequency. As it rises to 120 or more it perceptibly gets weaker. After a short time this is followed by sighing and faintness, then by vomiting, then by marked pallor of the lips, the face and fingers. Finally, the pulse, which has obviously been growing progressively quicker and feebler, in a very short space of time takes on an absolutely "fainting" character—that is, for some seconds it cannot be felt at all or is altogether too weak and uncertain to count; then for a few seconds or longer it slightly recovers some strength and volume; then it is lost again, the ebb and flow being repeated with ever-increasing feebleness until the final end. The patient's intellect during the whole of the time is, as a rule, wonderfully clear, and although she feels that her condition must be exceedingly grave, she shows herself to be fully conscious of those who are around her and the measures that are taken for her relief. This is true in the main for all bleeding which proves fatal without the surgeon's aid. In the special class of cases which I am now considering there will, in addition to these symptoms, be found some guide as to the source of the hæmorrhage. There will be the clinical history of early tubal pregnancy and direct abdominal symptoms and signs, abdominal pain and tenderness and rapidly increasing abdominal distension. By vaginal touch the experienced finger may also find a full and boggy condition of the pouch of Douglas suggestive of the presence of fluid or semi-clotted blood within the pelvis, but the symptoms denoting that a lethal hæmorrhage is actually taking place are of chief importance. There is no time to be lost in such a case, for though life may be saved almost at the last moment (on at least four occasions I have had the good fortune to meet with success when the patient seemed moribund, once after tubal rupture and three times after secondary hæmorrhage, the sequel of ovariectomy), we cannot count on this, and the time for operative aid soon passes. In describing the morbid anatomy of this "middle stage," on the consideration of which we have now entered, I observed that intra-peritoneal rupture was frequently postponed by the opening up of sub-peritoneal tissues. Under these circumstances there is no loss of the physical signs and symptoms already enumerated as diagnostic of the early stage of extra-uterine pregnancy, but there is a further development or extension of these which is characteristic and deserves attention. The "tubal tumour" which was felt in the early stage behind the uterus undergoes development to one side of the pelvis—from a comparatively small swelling, situated entirely posterior to the womb, growing to a mass of considerable size, the bulk of which is lateral in position. In three cases of this kind which have come under my care little or no pain of any importance occurred until

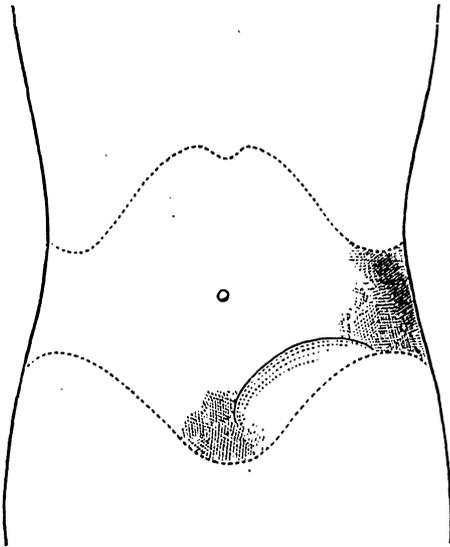

the third month. Irregular hæmorrhagic discharge from the vagina had taken place—in one case from the beginning of the pregnancy, in the other two after seven and after eight weeks respectively; but the actual illness, in the estimation of the patient, dated from the early part of the third month. This illness commenced with sudden and acute pain referred to the side of the abdomen and pelvis on which the pregnancy was forming, some pain thereafter persisting until the cause of it was removed by operation, while attacks of more acute pain recurred at irregular intervals. These attacks of pain have been supposed by some to be indicative of rupture into the peritoneal cavity, and in a few instances this may be a true interpretation. But so far as I was able to ascertain in the cases of which I am speaking, the attacks of pain pointed rather to sub-peritoneal hæmorrhages which were not necessarily associated with any special rupture other than that of sub-peritoneal bloodvessels. With the attacks of pain the tumour visibly increased in size, its upper margin appearing above the groin and forming a globular mass on one side of the abdomen quite evident to the patient herself and certainly growing in size from day to day. This tumour appearing above the groin is very characteristic of all broad ligament effusions. It is met with in hæmatocele of the broad ligament unconnected with ectopic gestation and in broad ligament abscess, and the general outline or contour which is occasioned by it on one side of the abdomen is seen in the accompanying sketches, which are taken from two of the cases I have been describing. (Figs. 3, 4.) In one case the attacks of pain were accompanied by considerable pyrexia, the temperature rising to as much as 102° F., and in all they were followed by gradually increasing and finally marked anæmia, distinctly marked in the colour of the lips and face, but not materially affecting the pulse or only temporarily doing so. In one case, not included in those which I have been describing, the tumour remained central throughout. In this case the cyst of pregnancy, which suppurated, remained directly behind the uterus and finally overtopped the fundus, being opened and drained in this situation at the time of operation. Another case (which I have published in some detail elsewhere) presented all the external configuration which I have described as resulting from growth and hæmorrhage beneath the peritoneum, but on operation its upper limit was found to be formed by adherent omentum, and the child in this case appeared to be really within the abdomen. If I briefly recapitulate the signs and symptoms to be observed in cases of extra-uterine pregnancy at the latter end of this middle stage, I notice that we find the history of some amenorrhœa, followed by several weeks of irregular vaginal hæmorrhage, and a tubal tumour extending to the one or to the other side of the pelvis and appearing above the corresponding groin as an exceedingly painful and tender swelling, which grows from day to day. On examination the uterus is found to be empty. The patient has attacks of ever-increasing pain, accompanied by distinct and progressive anæmia. (At this stage rupture into the abdomen is imminent, if indeed it has not already occurred, and operation should not of course be delayed.)

3. All cases which have survived to the advanced stage of extra-uterine gestation may be divided into two classes: those in which the child is living and those in which the child is dead. In the first class I do not think there should be much difficulty in diagnosis. In the only case which I have seen of this class it could be easily ascertained that the uterus itself was empty, while the child could be plainly distinguished through the abdominal walls, the foetal heart being heard more easily than in normal pregnancy. In the other class the case is altogether different. Beyond a large inert tumour, the nature of which may be hidden by the thickness of its walls, we may have nothing but the history to suggest the possibility of pregnancy. There is no foetal heart beat, no foetal movement, no placental souffle, the patient's breasts may have lost all indication of a pregnant state, and if septic disturbance has already taken place the patient may be in no condition to answer intelligently the questions of the examining surgeon. The history of amenorrhœa may be vague and incomplete, and even if present, and distinct we know that this is not an uncommon association or symptom of ovarian tumour which the abdominal swelling will closely simulate. Nevertheless a patient and careful study of the history of such a case will often lead the surgeon to a successful diagnosis. The slow enlargement of the abdomen for nine months, followed, after death of the child, by marked constitutional disturbance of febrile and

<sup>2</sup> The words "previously healthy" must be understood as referring solely to the immediate history of the patient. There may be old history of pelvic mischief from which the patient has apparently quite recovered, but as a rule there is no recent history of pelvic trouble before the date at which pregnancy might have begun.

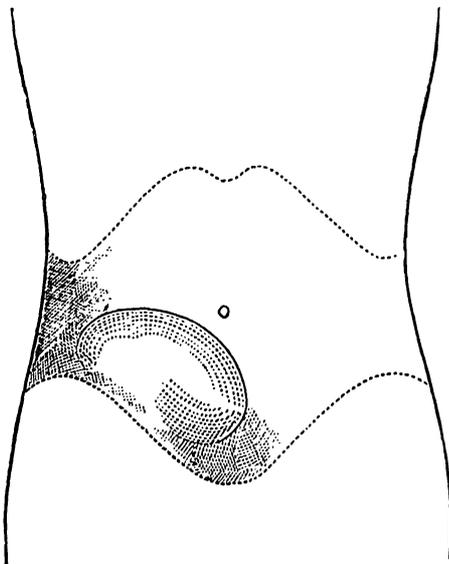

adynamic type, is a history which is only rarely associated with an abdominal tumour of different character. The child-bearing limits of age and the probabilities of pregnancy in any given case are also elements in diagnosis which of course must never be forgotten; and on deep palpation of the tumour one may sometimes feel the resisting body of the foetus after displacement of the fluid which surrounds it,

FIG. 3.

the only pathological state within the abdomen which yields a similar sign being a solid tumour, usually malignant, surrounded by ascitic fluid. The case of difficulty of diagnosis at this stage will of course largely depend upon the position of the child and on the thickness of its coverings. When free in the abdomen, palpation of the child is remarkably easy; when thickly covered, the pregnancy may present

FIG. 4.

very great difficulty in the way of ready and decisive diagnosis.

In a paper of this kind it is only fair to one's readers to state exactly the experience on which it is based. The present paper is founded on the personal observation of twenty-four cases of extra-uterine pregnancy, twelve of which came under my own care before operation. Of these twelve cases, in one only was the nature of the case

altogether unsuspected by myself before I operated. In two cases I simply diagnosed the condition as a tubal tumour without further qualification; in the remaining nine cases I diagnosed the condition as due to extra-uterine pregnancy, and in eight of these the diagnosis was proved to be correct by subsequent operation. The ninth, an early case, recovered without operation; a small sub-peritoneal hæmorrhage stopped the pregnancy, and the resulting hæmatocele was absorbed in the course of five or six weeks, during which the patient was kept confined to her bed. Three times I have diagnosed extra-uterine pregnancy and have been mistaken. As these mistakes (the one referable to the supposed early stage, another to the middle stage, and the third to the advanced stage) are, I believe, strictly typical of the diagnostic errors into which we may still be likely to fall, it may be instructive to report them. The first was a case of retroflexion of the gravid uterus with intra-peritoneal adhesions. The second was a case of pyo-salpinx of large size in which there was a history of three months' amenorrhœa. The third case was one of malignant disease of both ovaries. This constituted a large abdominal tumour which had been gradually forming for twelve months. Menstruation had ceased from the first appearance of the tumour. The febrile and adynamic state of the patient was quite as suggestive of septic infection as of malignancy, and on vaginal examination the finger, after displacing some ascitic fluid, distinctly felt two malignant nodules which exactly resembled the feet and ankles of a foetus at full term. Such cases may occasionally mislead the most practised diagnostician.

But there are other sources of error which may cause difficulty, especially to those who are less experienced, and these call for some consideration before I conclude. One of these is an error as to the field for observation. Practitioners have said to me: "I have attended upwards of a thousand cases of labour and have never met with a case of extra-uterine pregnancy. These cases must be exceedingly rare." I have answered: "Certainly those cases of extra-uterine pregnancy which are met with among instances of expected labour are extremely rare, for it is only those cases which have survived to the advanced stage that it would be possible to meet in such association. The proportion is much wider than that which you suggest. It may be possibly one in twelve or twenty thousand—I do not know exactly. It is not here that we must look for ectopic gestations, but in the daily cases of general practice. Has a practitioner never been called late at night to a patient who was suffering from sudden abdominal pain—a case presumed, perhaps, to be one of colic? He has given an opiate or carminative, and on calling the next morning she has expected to find the patient well again; but she is evidently worse, even dangerously ill, and by midday she has died. Such may be roughly the history of a case of early rupture. Or, again, the medical man may have met with a case of supposed parametritis or pelvic cellulitis in which there was a distinct mass on one side of the pelvis. The patient has been kept in bed, but the swelling did not go down, neither did any abscess form or pus discharge. The swelling increased, the patient became worse, and after two weeks' attendance she died rather suddenly with abdominal symptoms, which indicated some internal perforation. Such may be roughly the history of a case of tubal pregnancy which has invaded the broad ligament, and after some three or four weeks' growth has ruptured into the abdomen."

Another source of error is the coexistence of a normal intra-uterine pregnancy with some other abdominal tumour. This is found in a rather large number of pregnancies—either an ovarian cystoma or a myoma or carcinoma being the more common tumours to be found in this connexion; and one might be tempted to conclude that because there is some abdominal tumour present the pregnancy is out of its proper place. In every case of extra-uterine pregnancy which I have met with it has been possible to satisfy oneself that the uterus was empty. In some cases it has been enlarged; in one the sound passed to five inches, but there could be no doubt that the tumour was outside the uterus, and that if pregnancy existed at all it was certainly not occupying the uterine cavity. This is, of course, the crucial point that will always eliminate the class of case we are now considering from the diagnosis of extra-uterine pregnancy—the determination that the uterus itself is empty. There is one exception that is so rare that it may be said to prove the rule. This is the possible presence of a normal pregnancy within the uterus, together

with a second (extra-uterine) pregnancy outside the uterus. Such cases have been recorded, and are said by some statisticians to be frequently met with. They belong, however, rather to the curiosities of medical literature than to the field of practical gynaecology.

Birmingham.

## PSYCHO-THERAPEUTICS.

### ANOTHER FRAGMENT.

By GEORGE M. ROBERTSON, M.B., M.R.C.P. EDIN.,  
SENIOR ASSISTANT PHYSICIAN, ROYAL ASYLUM, MORNINGSIDE, EDINBURGH.

IN THE LANCET of Aug. 20th Dr. Dale published a paper under the above title. The first part of the article consisted of a number of examples of the influence of the mind on the body in producing diseases, and the second part of examples of the influence of the mind in curing or removing diseases, with an eulogy on the therapeutic value of music. Since Dr. Hack Tuke produced his work on the "Influence of the Mind upon the Body," so full of interesting examples, both these points have been fully admitted. Therefore, in an article on Psycho-therapeutics some fresh observations on the practical application of these principles were to be expected. I was disappointed, however, at the brevity of Dr. Dale's remarks on this point, at their generalness and want of useful detail and at their lukewarmness, in spite of the evidence he has brought forward. He states: "It appears then, finally, that Faith and Hope are the two great principles which the physician must encourage or seek to evoke in his patient," and which "may perchance create within him a courage which will enable him to make at least a brave stand against his foes," and he who expects more than this will, Dr. Dale thinks, be disappointed. For my part I think it very disappointing to find these to be the whole conclusions of a scientific article on psycho-therapeutics at the present day, seeing that they have been fully recognised and applied in medicine for many generations. In the following lines, therefore, I would wish to supplement Dr. Dale's article by a fuller account of the most recent views on psycho-therapeutics and the scientific application of these principles in practice.

In order to discover the principle of the scientific application of psycho-therapeutics, it is very instructive to study the numerous examples of the unconscious application of them. Of this I will give a few examples.

Religious relics have had a great reputation for the cure of diseases, and Dr. Hack Tuke relates how the Rev. Fred. Wilfred Faber, who suffered from severe headaches and sickness which completely prostrated him, was instantaneously cured by the application of a relic—a piece of linen of St. Mary Magdalene of Pazzi—to his forehead. A sort of fire went through his head, through every limb down to his feet, causing him to tremble, and he cried out, "I am cured; I am quite well." In this instance, an excellent and good man, having a strong religious faith in the efficacy of the relic and complete confidence that by some supernatural means this piece of linen was able to exert an influence over him, obtained instantaneous relief, when in this frame of mind he applied the relic for the purpose of removing the headache. This case may be taken as one out of innumerable examples of the power of religious faith, the most powerful of all psychical agencies, in effecting "miraculous" cures.

The next example is that of magnetic healing. A very intelligent lady, a friend of mine, who believes in this agency and who lives in an atmosphere of absolute faith in the healing powers of a certain magnetic healer, went to this man when she was suffering from a gumboil, which gave her great pain. This man passed his fingers on the cheek over the painful swelling and almost instantly all pain left the gum, and the swelling disappeared in the course of the next twenty-four hours. This lady had complete belief in the existence of animal magnetism, which so many of the pseudo-scientific hold, and in its mysterious healing properties; she also had perfect confidence in the healer consulted being able to remove the pain of the gumboil by these means.

The third example I shall give is that of the action of a remedy with a very great reputation but alleged to consist of nothing stronger than distilled water. A lady was suffering from cancer and was in the last stage of cachectic exhaustion,

when her husband was much impressed with Mr. Stead's article on Count Mattei's cancer cure and he determined to make a trial of it on his wife. With the first dose all the wracking torture that the woman suffered from disappeared, and she continued taking this remedy for the last fortnight of her life with total alleviation of pain. In this case we have a woman whose hope of recovery had been extinguished, when suddenly there appeared a heaven-sent remedy whose action was subtle and sure, and she clutched at it with a faith and a hope born of her despair. The result of its use was that, as regards her subjective feelings, she felt recovered, though the fatal disease was unaffected. A similar fact is stated to have been observed by the committee of inquiry into Count Mattei's remedies.

These three instances which I have given are very good examples, though unconsciously so, of the practical application of psycho-therapeutics, and what we must do is to see if the orthodox members of the profession may honourably and scientifically make use of this agency without also practising fraud and deception. The first feature to be noted in these three cases is that each of the agencies employed had a great reputation. Of that with the sanction of religion it is unnecessary to speak; of animal magnetism there is the semi-scientific foundation which has been given to it, as well as the undefined mysteries attaching to magnetism and electricity in the popular mind; and of Count Mattei's remedies, it is certain that they were puffed up by extravagant assertions and by reputed examples of their power, that carried conviction to most people ignorant of pathology. But the most important and uniform feature in these cases is the subjective mental state of the patients. They all had a firm belief in the agency they were using; they all had complete confidence that they were able to be cured, and they all had the expectation of being cured. Now, I ask, cannot this reputation of the agent and this frame of mind in the patient be developed and made use of in a scientific manner for therapeutic purposes? This question has been solved in the affirmative. In the French town of Nancy, among the poorer classes, Professor Bernheim has acquired a reputation for the cure of disease that is almost unbounded, and these classes go to his wards in the city hospital with the utmost belief and confidence in his ability to cure them. The result is that Professor Bernheim, by merely asserting to many patients in the wide-awake condition that they have no pain, removes at once any pain that they may have had; by ordering them to sleep, they go off to sleep at once; and by telling them that they cannot raise their arms, they are unable to do so, and so on. The same thing is observed by Dr. Bramwell of Goole, where he has acquired a reputation resembling Professor Bernheim's at Nancy. He demonstrated four patients to the Congress of Experimental Psychology in London, and whatever he said to these patients in the wide-awake condition was instantly believed and took place. He produced anaesthesia, total and partial, hallucinations and sleep, all in a moment, by giving a verbal or written order. In one of the women he had caused to be extracted painlessly seven teeth out of eight by the simple assertion that she would suffer no pain, and he had also by this means stopped sea-sickness. His power for the benefit and comfort of these patients in the minor and more common ailments of life by simple assertion was almost complete. The possession of this power by one or two members is of very little value to the profession as a whole, and, through it, to the general public, but I may mention here that psycho-therapeutics is unconsciously made use of by all those with reputations in our profession. It is a commonly accepted belief that a well-known consultant will often speedily cure an ailment with a drug that has proved of no benefit when prescribed by a young man with a reputation still to make. This, of course, can only be done through a psychical agency. The patient must have greater confidence in the powers of the consultant and in his ability to cure him than in the young practitioner, and a greater if not complete expectation of being cured. These feelings are no doubt enhanced by the impressive manner of the consultant, by his crowd of patients from far and near and by his big fee. The last item has a distinct psychical significance, for we automatically associate a value to an article in accordance with the cost or difficulty of obtaining it, and this has been true since the days of Naaman the Syrian.

In addition to this use of psycho-therapeutics in medicine there is also no doubt a daily use made of this agency by the numerous body of family physicians, of whom we have just reason to be proud and who have acquired the respect and

confidence of their patients. A word from what is called "our own doctor" will often do more good than scientific medicinal treatment by a skilful stranger. Unconsciously and in these indirect ways psycho-therapeutics is probably very greatly made use of by the profession, and I think the success or otherwise of many physicians depends largely on having or not having acquired the power of giving such mental suggestion to their patients. Such a method of using this agency can, however, hardly be described as either rational or scientific.

By far the most general and scientific application of psycho-therapeutics is made by adopting the system of suggestion as practised by Professor Bernheim. He has found that the majority of patients, even within the area of Nancy, will not accept orders or suggestions for the relief of pain &c. in the waking condition; but he has discovered that if he first suggests to them that they are asleep, which suggestion the vast majority of his patients receive very readily, he is then able to order or suggest that their pains &c. have gone, and they now believe him implicitly, with the result that they are so far cured. He tells the patients that if they will follow his directions he will remove their ailments. He asks them to prepare to go to sleep, and in a persuasive yet confident tone he suggests the symptoms of sleep. In a few minutes the majority of patients get into a somnolent state, not so deep as ordinary sleep, in which they answer questions, but appear to have less will power and independence than in the waking state. When in this state Professor Bernheim asserts, with some persistence if need be, that the pain or other affection has gone, and almost invariably the patient accepts his suggestions and awakes free from all symptoms. The explanation which Professor Bernheim gave me of the use of suggesting to the patient that he was asleep was that the symptoms of sleep were easy to call up, they were familiar and natural, and therefore a patient, without possessing very great confidence in the operator's powers, could, with much facility, be made to believe that sleep had come upon him. Whenever the patient has been put into this state his confidence in the operator is immediately strengthened, as he has received a demonstration of his powers, and the subsequent suggestions of the removal of pain &c. are now so much the more easily believed in. In addition to this, in the somnolent state there exists increased suggestibility or *credibility* and less independence of thought, which assists greatly in the giving of suggestions. It will be thus seen that this *rationale* is adopted to develop artificially those conditions which, as we pointed out, seemed essential in the application of psycho-therapeutics. I may add that the ability to induce this somnolent condition can be easily acquired by anyone with tact. It will be noticed that I have not made use of the term "hypnotism" in my description of Professor Bernheim's procedure, for he wishes the whole process to be understood as suggestion and his method known as "Treatment by Suggestion." Van Eeden, at the Congress in London, also pointed out that those who made use of psycho-therapeutics regretted very much its association with hypnotism, which had done it much harm.

The practical uses of suggestion for the cure of disease are innumerable. It is, in the first place, useful for the removal of all states of a painful nature, whether inflammatory, rheumatic, or neuralgic, whether functional or organic. This of itself covers an immense field, and by the removal of pain the most disagreeable symptom of many ailments is cured. The sensation of pain takes place in the cerebral cortex; it is a mental state, it implies consciousness, and hence, by an alteration in our state of consciousness as is induced by psycho-therapeutics, pain caused by cancerous or other organic disease can be as readily cured as functional pain. It may also be used to cure insomnia, chorea, nocturnal enuresis, nervous diarrhoea, irritable coughs, sickness and want of appetite, feelings of breathlessness, and many other unpleasant psychical accompaniments of disease. The removal of these symptoms, it may be said, does not remove the real cause of the disease. This is so far true; but it is certain that the removal of anxiety, and the directing away to healthier channels of the attention, indirectly hasten recovery and break one of those vicious circles so common in pathology. The benefit to the patient, as regards comfort alone, is in many cases worth a very great deal, and an important feature of this treatment is that it may be combined with ordinary medicinal treatment, and may even assist drugs in their action. The idea of making use of such procedures as I have described is new to the profession; it is altogether unconventional and different from ordinary orthodox practice, and therefore we

expect it to have to fight an uphill battle till recognition takes place. I think, however, it is not worthy of a scientific body like our profession that members of it, usually ignorant of the modern practice of psycho-therapeutics, should make imputations and rash assertions of an unfavourable nature about it and thus intensify the difficulty of a fair trial. Psycho-therapeutics such as I have described can be practised altogether in accordance with the honourable and upright sentiments of the profession, and in a truthful, rational and scientific manner.

In conclusion, it will be noted that, in opposition to Dr. Dale's belief that the scope of the usefulness of psycho-therapeutics is limited, I believe it may be used to alleviate or remove the symptoms of most diseases; that though the instilling of faith and hope is of value in the ultimate recovery, much more immediate and palpable benefit can also be done to the patient by removing unpleasant symptoms; and, finally, whenever any physician has acquired a certain skill in the procedures, his results will be far from disappointing.

## "THE ETHICS OF OPIUM AND ALCOHOL."

A REJOINER.

By F. J. MOUAT, M.D., LL.D.

IN April last a communication of mine regarding the relative positions of opium and alcohol in their social, commercial, medical and judicial aspects was published in THE LANCET. To this a reply has now been made by Dr. Pringle in THE LANCET of the 10th inst., in which he characterises my statements "as apparently authoritative" and deliberately erroneous respecting the single factor of my contention which he refers to—viz., the influence of opium in the causation of the mortality of a few of the prisoners under my administrative control for some fifteen years in Bengal. His chief argument is based upon his failure to find in my official returns a special column for the record of deaths from opium, and he quotes a number of extracts from my official reports of some five of the prisons in Assam, to show that the death-rates in dysentery in that number of the prisons out of the fifty-seven under my charge, were mainly due to opium.

In the first place, he must have known even from his limited experience of the two small prisons of which he was the medical officer that no such column existed, partly because I did not consider it necessary, as I had authority to obtain any medical information I required for administrative purposes from the medical officers attached to the prisons; but chiefly because the purely professional concerns of the gaols under my charge were in the hands of the medical department, which dictated all the forms to be used in furnishing medical returns. An extract from my statistical report for the lustrum 1861-65, pp. 82-3, will show more clearly what I mean. The diseases chiefly influenced by opium were dysentery and diarrhoea.

"The admissions from dysentery, omitting the years 1849, 1850 and 1857, for which there were no returns to the medical department, were 92,935, and the deaths from this number in seventeen years were 8244, giving a ratio of death to sick of 8.87 per cent. and of deaths to average strength of 2.11 per cent. Thus one-fourth at least of the whole mortality was due to this disease alone. The proportion would be greater if the records of the blank years were forthcoming. This lamentable fact points strongly and urgently to the pressing necessity of a thoroughly scientific investigation of gaol dysentery, its causes and consequences. I am afraid that some part of this fearful destruction may have been due to erroneous plans of treatment. Several years ago I found in one gaol every case of scorbutic dysentery treated by mercurial salivation. As might be anticipated, every case so treated died. In another gaol I found the dysenteric patients in the last stage of exhaustion fed with thin arrowroot, which the dying prisoners had to take up with their fingers. Within the last two years I discovered the existence in one of the Assam gaols of grievous malpraxis in the management of this same disease. In each of the instances referred to the matter was mentioned in my reports to the Government. The application of the remedy did not rest with me, as the control of the medical

affairs of the prisons is not and has never been in my hands. The statistics of the treatment of prison diseases are a very necessary part of the application of the numerical method to their study and investigation. The returns of diarrhoea are also deficient for the same years as those of dysentery. In the seventeen years mentioned (1846-1865) there were 64,441 admissions from diarrhoea and 3162 deaths, or in the proportion of 4.90 per cent. of attacked, and 0.81 of strength. This record, again, I believe to be inexact. I have seen cases of advanced phthisis noted as diarrhoea, and examples of œdema and the diarrhoea that ushers in the fatal event, entered under the heading of diarrhoea. More care and exactness in some gaols are wanted in this matter."

Again, I note in another part of the same report that "dysentery is by far the most fatal disease [in the Bengal prisons]. It is essentially scorbutic in character, and depends chiefly upon bad drainage, overcrowding, sleeping within immediate reach of noxious exhalations from the ground in a malarious country, and from breathing an atmosphere poisoned by the exhalations from the bodies of the prisoners themselves. It is much to be regretted that a complete scientific investigation of this form of gaol dysentery has not long since been ordered" (p. 45). "The whole subject of prison diseases, and of this class of gaol diseases in particular [zymotic diseases], demands careful scientific investigation, and I hope will ere long receive it. It is not within the sphere of my functions, or it should have been commenced when the gaols were first placed under my superintendence in 1855. I make this remark in self defence, because the leading medical review of Great Britain (THE LANCET), in noticing one of my reports, taxed me with neglecting the most important of the duties of a medical superintendent—which I am not and have never been" (Report of 1861-66, p. 46).

I did start such an inquiry in the case of cholera in 1855, but the Medical Board of the time objected to my conducting such inquiries, as being their *proper* function, and the government of Bengal yielded to the objection. I need scarcely say that the investigation was not even entered upon by that body of Conscript Fathers. There were doubtless other influences at work in producing the diseases above mentioned, such as changes in diet, different ethnic and ethnic peculiarities and habits, and transfers from one district to another, together with all causes of loss of health, such as abuse of alcohol, gunjah, opium and dissipation generally, each of which acted more or less prejudicially on all criminals imprisoned. It would be difficult to me, after the lapse of so many years and in the absence of the original documents from which the returns were compiled, to assign to each its special responsibility. I am satisfied, however, that the least important of them was opium, and even that in a very restricted area and among small bodies of criminals. It was a real *quantité négligeable*. I can vouch absolutely for the correctness of the returns themselves. The medical officers who submitted them were right in not recording predisposing agencies as specific diseases, to the attacks of which they were merely contributory in varying degrees.

As to the insinuation that the corruption of the subordinate agents of the prisons caused the smuggling of opium in such quantities as to exert a prejudicial influence on death-rates, it is the most utter and absolute nonsense. It simply did not occur, for had it done so it must have been known to the officers in charge of the prisons and to myself. This tendency to misrepresentation, and clumsy endeavours to convert facts into fictions and the reverse, are among the most discreditable features of the mischievous anti-opium crusade. The fact, then, that not a single death which could be attributed directly to opium, even as a poison, occurred in the gaols of Bengal among more than 300,000 prisoners, of whom 2404 died from dysentery and 884 from diarrhoea in the five years under review, has not been touched in the smallest degree by the diatribe of Dr. Pringle. His avoidance of the subject of alcohol on the ground of its inapplicability to India is somewhat singular, inasmuch as had he read my remarks more carefully than he appears to have done, he would have found that they applied solely to England.

And now as to the comparative harmlessness of the habitual use in moderation of opium in India, the evidence of those medical officers and have lived for years among the Rajpoots, Sikhs and other warlike and manly native races, is conclusive, and cannot be set aside by any of the questionable exaggerations and mischievous misrepresentations of the rank and file of the army of philanthropists and faddists who have

sent troops of young women into the villages to preach a doctrine of suppression and implied immorality of what they can have no right understanding, and have circulated what appears to me to be one of the most mendacious documents I have ever read among the members of the medical profession to secure their signatures to a petition to the Legislature to suppress the cultivation of the poppy in India for any other than medical use, in a form utterly inapplicable to that country. A copy of it was sent to me, and I was surprised to see the name of Dr. Pringle attached to it, for I can only apply to it the scorn expressed by Cicero in one of his orations: "Falsum est in totum, neque solum fictum, sed etiam imperite absurdeque fictum."

Dr. Pringle makes merry over the applicability of the term "pick-me-up" to opium, and the meaning of the word "ethics," which he apparently does not understand. I can give him one crucial example of its sustaining power in those accustomed to its use, which came under my personal observation. I once drove from Patna to Mozufferpore in Behar on duty, and when approaching the latter place came up with a regiment of Sikh infantry which had marched forty miles during the night, had scarcely a straggler, and were as "fresh as paint" at the end of its march. Each man had his small supply of opium with him, and had used it, and could not have undergone this exertion in heavy marching order without it. They had beaten the record of the famous Light Brigade in the Peninsula mentioned in Napier's history for their marching feats.

The remarks of Dr. Pringle on a case of tetanus, and on two or three other incidents of the administration of the prisons in Bengal, are entirely out of place and inapplicable to the subject under consideration, and so need no notice from me.

The etiology of the prison sickness and mortality of the gaols of Bengal is, as I have mentioned above, a very complex question in which opium, fortunately, plays a very insignificant part, and that only in a restricted area and among a small number of criminals—in five prisons out of fifty-seven. I had by a careful study of the matter within the limits of my authority, succeeded during my administration in reducing the death-rate by one-half, by which a saving of about 600 lives annually was effected. As soon as my back was turned the chief measures which I introduced were undone by the next Lieutenant Governor of Bengal, who had a theory of prison discipline of his own, and the immediate result was a return of the old scale of mortality.

It is somewhat singular that the chief portion of my examination for my degree of Doctor of Medicine was on malarious fevers and their treatment by opium, which was at that time the prevailing doctrine and practice. That the same question should have occupied my attention more than half a century afterwards is rare, and certainly gives me some claim to more than an apparent authority on the question under consideration. I have in my official capacity as a professor of medicine both taught and practised medicine in its relations to tropical diseases, and as the first professor of medical jurisprudence in India I have considered the opium question likewise in its medico-legal aspects. Dr. Pringle has been good enough to say that my article on opium has carried more weight with the profession and the public than any of the other writings on the same subject. I venture to think that he has inflicted more damage on his own cause than on my position, and I believe I may safely say to anyone who has taken the trouble to follow up this question, "Utrum horum, mavis accipere."

## SPONTANEOUS RUPTURE OF THE SPLEEN IN AGUE.

By JOHN BOWIE, M.B. EDIN.

T—, aged thirty, a cavalry soldier, a tall, strong, finely built man, came out to Africa in the service of an African traveller towards the end of July, 1889. Some years previously he had served in Egypt and in South Africa, but had never suffered from any illness; he had never had fever, dysentery, diarrhoea or syphilis. Some days after coming up to the hills, on August 7th of the same year, he had a slight attack of fever, which lasted only a few hours. About a fortnight afterwards, while on his way to Lako Nyassa, he had another attack of fever lasting only a few hours, a similar attack occurring about eight days afterwards. He was nervous

about himself and had quite a morbid dread of African fever, so he determined to leave the country and immediately start on his way home, to arrive at Blantyre in the Shire Highlands in the last week of September. About a fortnight after his arrival the patient, who had been in excellent health, had a shivering fit and developed an ordinary attack of ague, accompanied by a good deal of vomiting. In the afternoon of the same day I saw him for the first time professionally. He was then suffering from a mild attack of ague, and exhibited no unusual symptoms; the spleen was slightly enlarged on percussion, but could not be felt on palpation; the other organs were normal. The patient was exceedingly anxious about himself and had quite an unusual fear of fever; his face was very pale and his expression of countenance was one of great dread. I reassured him about his condition and left him more comfortable. The following morning he was feeling perfectly well; no fever, pulse good, tongue clean, no pain; the bowels had been moved, and he was up and going about. At 6 P.M. he had another shivering fit, with sickness and vomiting. He at once went to bed and obtained hot-water bottles, blankets &c. About 7 o'clock, and before the hot stage had begun, he complained to his companion of a severe pain at his heart. His attendants thought little of this pain, putting it down to his well-known dread of fever, and did not send for me till early next morning, nearly twelve hours after the attack had commenced. The attendants told me that the man had passed a very bad night and had had no sleep; he was continually retching, occasionally bringing up a little greenish-yellow fluid; had complained of being cold all night, and had sometimes broken out into a cold perspiration. In addition to the pain, as he said, at his heart he had felt pain in the region of the kidneys and had not been able to pass any urine, though expressing a great desire to do so. The bowels had been moved twice, each motion consisting of a little dark-coloured fluid. I found the patient lying slightly propped up in bed, with an anxious and frightened expression of countenance; the face was of a dirty-grey colour, and the features looked rather pinched, but not markedly so; the lips were livid and pale, the eyes were clear, not sunken, and the pupils dilated; the tongue was of fairly good colour, but very dry, with a thin brown coating towards the back part. The patient complained of intense thirst and had been drinking tea almost constantly during the night. I could not get the rectal thermometric temperature, but those parts of the body not in contact with the hot-water bottles were cold. The breathing was thoracic, very short and rapid, averaging over forty to the minute. The patient said he suffered from pain in the left and right hypochondriac regions, which had been present all night and had compelled him to lie on his back, any movement to his right or left side increasing the pain, which was also increased on any attempt to take a deep breath. There was no drawing up of the legs, the patient lying with them fully extended and kicking them about nervously. The pulse could be felt but not counted at the wrist, and on listening over the heart the sounds were very faint and indistinct. The abdomen showed no marked distension; on gentle palpation the walls were found tense above the umbilicus, but below it they were soft and could be readily manipulated without causing any pain. Gentle pressure in the left or right hypochondriac region caused expression of pain, the left side being most tender. Percussion could not be satisfactorily performed. There was no dulness over the bladder, but as the patient complained of a great desire to void urine and of inability to do so, I passed a soft catheter and drew off about an ounce of dark-yellow, slightly turbid urine, which gave a marked precipitate of albumen by the heat and cold nitric acid tests. The patient was quite conscious, his intellect perfectly clear—indeed he seemed to be in a condition of exalted sensibility or “irritable weakness,” the slightest touch of a hot-water bottle causing him to cry out; he was nervously restless, continually moving his arms and legs; he knew that he was nervous, as he said that he felt quite hysterical. There was no pain in the head, no singing in the ears, no sighing or yawning respiration. The thirst was most intense. His constant cry was for something to drink. I simply treated the collapse, pain and vomiting, giving him champagne, morphia, hot pack &c. By a little after eight o'clock the retching stopped and the man said he was much easier, the pain being much relieved, the parts, however, still remaining painful on pressure; he was now able to lie on his right side, but lying on the left side always caused a feeling of great oppression. Gradually, however, as

the morning wore on, the patient became more anæmic-looking, the lips losing their lividity and becoming very pale; the tongue also began to lose its colour; the abdomen became slightly more distended, though remaining soft below the umbilicus; the pulse gradually lost strength at the wrist and became imperceptible; the thirst became more intense—indeed, I never saw in anyone such a condition of thirst; there was hardly half a minute during the whole six hours I was with him in which he did not beg and pray for drink, though I was continually giving him small quantities of water and moistening his mouth and tongue with slices of fresh lemon. The breathing became quicker. About eleven o'clock he complained of great oppression in the chest—the air, he said, “would not go down.” There was still good muscular power, as he could turn readily on his right side, and all his senses were perfectly clear. He was, of course, not allowed to lift his head; but about twelve o'clock he said, “I must get up; I will choke if I lie still.” He made an attempt to rise, but immediately fell back and gave a gasp; his eyes rolled and there was a convulsive movement of the whole body, it being for a second or two in a condition of marked opisthotonic contraction; grinding of the teeth ensued, both hands made a grasping movement over the pubis, and after lying faintly gasping for about a minute all was over.

Three hours after death I made an examination of the body. Rigor mortis was well marked in the neck, arms, and hands, beginning in the legs. On opening the abdomen there was a gush of about a pint and a half of dark fluid blood; on gently retracting the walls without disturbing the relation of parts a thick black clot of blood about as large as a cocoanut was seen lying below and to the left of the distended stomach; from this large thick clot there passed a long clot about an inch and a half broad by half an inch thick across the abdomen to the right, ending at the portal fissure of the liver; extending downwards from the large clot was a second thin large clot which passed down the left side into the pelvis. The limitation of the clots was very distinct, none being found in any other situation. On removing the large clot it was found to be in connexion with a rent about four inches in length on the anterior external surface of the spleen. On removing the spleen very carefully (there were no adhesions) and examining it the capsule was found to be clearly separated from the parenchyma for a distance of about two inches on either side of the rent. On grasping the edges of the torn capsule and holding up the organ, it had exactly the appearance of a miniature placenta and membrane, the separated capsule forming a shallow membranous bag, at the foot of which, lying flattened out, was the splenic parenchyma. The parenchyma was neither soft nor diffluent, but rather firmer than normal and of a lighter colour (probably due to compression by the blood effused between the capsule and the parenchyma). The capsule was tolerably tough and could not be readily torn. On cleaning away all the blood clot and blood from the spleen the organ seemed little if at all larger than a normal one. The stomach was distended with a brownish liquid; the intestines were quite empty and collapsed, lying flattened out like gigantic tapeworms. The left side of the heart was entirely empty of blood and the ventricle markedly contracted along the base of both cusps of the mitral valve; on its auricular surface was a row of small firm granulations, the largest being about the size of a pin's head; no thickening or adhesion of the cusps. The right side of the heart was flaccid, the ventricle empty, and a small, partially decolourised clot in the auricle. The kidneys, except for great anæmia and a small cyst at the apex of the right one, appeared perfectly normal.

*Remarks.*—The special interest in this case seems to me to be the really healthy condition of the patient previously to the fatal rupture. Spontaneous rupture of the spleen is by no means a unique accident, but in almost all the cases in which it has been noted it has occurred either during or following some serious and more or less prolonged blood disease. Thus it has been noted in typhus, typhoid and relapsing fevers, leucocythæmia &c. All these diseases greatly alter the blood and through it the spleen, the substance of that organ having been found in most cases very much softened and sometimes quite diffluent. In malarial fevers the spleen is very early and most markedly affected, but for its tissue to become degenerated or organically altered a certain quantity of the malarial poison and a certain space of time are required. Now the patient had only been a little more than two months in Africa altogether, and of that time more than a month was spent on the hills,

where there can hardly be said to be any malaria; he came into Africa at the very safest season of the year, had been excellently looked after, and had hardly suffered at all from fever; indeed, the gentleman in whose service he was, and who has seen a good deal of African fever, told me that the very slight attacks of fever which the man had previous to my examining him were so mild that he doubted whether they were attacks of fever or of temper. Although we must never forget the very insidious nature of the malarial poison, and how it may thoroughly undermine the system without giving any gross sign of its action, yet we must bear in mind that this slow poisoning only occurs under special conditions, amongst which is a somewhat prolonged stay in a markedly malarial district. In persons whose systems have been thus undermined by the poison rupture of the spleen may be readily caused by any trivial accident, such as a slight blow over the spleen or even by a much less strain, as in a case I heard of where a gentleman ruptured his spleen by vigorously stretching himself after his bath. In all these cases, however, the splenic tissue has been greatly altered—the capsule has lost its toughness and elasticity. Dr. Barrallier gives two cases of rupture of the spleen during first attacks of ague. I have not been able to get his original article, but in one of your contemporaries,<sup>1</sup> where it is quoted, mention is made of both spleens being found softened on post-mortem examination. So I presume the patient had been exposed for some time to the poison or had suffered some days from the fever. Although in most books it is said that the rush of blood to the spleen in cases of malarial fever may be so great as to cause rupture of that organ, yet when we consider the many thousands of cases of ague which occur every day and the exceedingly rare occurrence of rupture I think we may fairly conclude that something more than a mere increased blood pressure is required to trust the very tough and resistant capsule. In most cases this extra factor is found in the degenerated condition of the splenic tissues—a cause, however, which in this case neither the history nor the post-mortem appearances warrant us in accepting. I think an extra factor or predisposing cause might perhaps be found in the utterly depraved condition of the patient's nervous system, as evidenced by the intense anxiety and dread which he showed. Everyone knows the evil influence which great mental worry and an emotional condition exert on the bodily functions, and from time immemorial the spleen has been debited with being specially affected by conditions of anxiety and depression. How far this old belief is correct has yet to be ascertained; but the investigations of Botkin of St. Petersburg, who found that depressing emotions caused an increase in the size of the spleen, give some little scientific support to τὸν σπλῆνα ἐκβάλλειν of the ancients. From the extensive and very clear separation of the splenic capsule from the parenchyma it would almost seem as if the hemorrhage had been first subcapsular (though no varicose or distended veins were found in the substance of spleen post mortem), and that the blood had made room for itself by tearing through the splenic trabeculae and pressing the parenchyma backwards, the blood gradually increasing and finally rupturing the capsule. As I have noted, the patient experienced a distinct relief from the pain about 8 A.M.; the relief was very decided, and he showed it by his movements. It is very improbable that the morphia—which for want of a reliable subcutaneous solution was given in the form of pills—and the champagne could have any effect, as the stomach could hardly have absorbed them. It is just possible the relief experienced was due to the rupture of the capsule relieving the tension of the pent-up blood. This might also explain the fact that when I first saw the patient, ten hours after the rupture, which I date from the first complaint of pain at the heart, the mucous membranes and tongue were more livid than pale. The amount of liquid which the stomach contained was much greater than the amount the patient had received for at least six hours, and as the intestines were absolutely empty it would seem that the stomach had neither been able to absorb the liquid nor to pass it on to the duodenum for several hours before death. The albuminuria in the little urine drawn off doubtless arose from the damaging of the epithelium of the capillary tufts, which is said to occur whenever a full stream of arterial blood is not kept flowing through them. The symptoms presented an interesting

mixture of those of collapse and of hemorrhage, several of the prominent symptoms of both being wanting and many modified or obscured.

Blantyre, East Central Africa.

## FRACTURE (DISLOCATION) OF SPINE; REDUCTION; TEMPORARY RECOVERY.

By W. ARBUTHNOT LANE, M.S., F.R.C.S. ENG.,  
ASSISTANT SURGEON TO GUY'S HOSPITAL AND TO THE HOSPITAL FOR  
SICK CHILDREN.

W. J.—, aged eighteen, was struck in the back by a heavy iron gate, which fell upon him. He was admitted into Guy's Hospital at 1.30 P.M. on June 13th, where he was found to have some deformity of the spine about the tenth and eleventh dorsal vertebrae, between the spinous processes of which a gap of some extent could be felt. He then had apparently complete or nearly complete power over his legs as he lay on his back in bed. By about four o'clock he began to complain of pain in his legs and in the lower part of the abdomen, and when asked to move his legs he did so with much difficulty and but to a slight extent. It was impossible to say how far his inability to perform any movement was due to a loss of control over the muscles or to a disinclination to make any alteration in the position of the limbs owing to a consequent increase in the pain from which he suffered. Probably both conditions existed. As time went on the hyperæsthesia became more marked, and any movement or noise in the vicinity of the bed exaggerated his pain greatly. This was most obvious below the knees. Sensation was at the same time much modified. For instance, pulling a hair of his leg caused him great pain, though he could not tell what had been done. The reflexes were much exaggerated.

Mr. Golding-Bird saw the patient just after his admission, before any of the above symptoms had developed, and in his absence I saw him at 11.30 P.M. As the symptoms were steadily increasing in severity I determined to operate at once. A long incision being made and the spinal muscles having been turned aside, it was found that the tenth dorsal vertebra was displaced forwards and slightly downwards, so that the cord was compressed between the laminae of the tenth and the body of the eleventh dorsal vertebra. The displacement was not considerable, so that the cord was apparently squeezed rather than crushed. The interspinous ligament was torn through. As the lower articular processes of the tenth dorsal vertebra lay in front of the upper articular processes of the eleventh dorsal vertebra the latter were cut away. After great difficulty the tenth dorsal vertebra was dragged back into its normal position. This was effected partly by over-extending the dorsal spine and partly by traction exerted upon the spinous process by lion forceps. As on the removal of this traction the displacement recurred, I passed a stout silk ligature between the spinous processes of the ninth and tenth and the eleventh and twelfth dorsal vertebrae, and by that means tied the tenth and eleventh spinous processes immovably together.

On June 14th the symptoms continued as before the operation. On the 15th they diminished slightly but distinctly. On the 16th the improvement continued, but it was still necessary to give morphia to control the hyperæsthesia. By the 21st the hyperæsthesia had disappeared, and he could move his legs a little, apparently without pain. The silk ligature was then removed. By the 26th he appeared to have recovered complete control over his legs. The spinous processes were in good position over the same transverse plane. The reflexes were then normal. The patient was extremely troublesome and restless throughout, and after the wound had apparently healed firmly it broke down, a portion of a spinous process coming away, when the ligature, being useless, was removed. He kept constantly rolling about, and complete paraplegia soon developed. The spine was then explored, when the vertebrae were found to be displaced laterally upon one another and the cord was completely divided. This unfortunate result was due solely to the extremely troublesome character of the patient, a poor half-starved, half-witted creature, whom it was found impossible to control satisfactorily by any means.

The case is one of much interest, and resembles more or

<sup>1</sup> Brit. Med. Jour., vol. 1, 1891, p. 370.

less closely one published by Mr. Golding-Bird last year. It would appear that the symptoms in this case were due to pressure rather than to the presence of hæmorrhage inside the cord. It was evident at the time of the operation that there was no such considerable collection of blood inside the sheath of the dura mater as could produce symptoms of compression, and one was surprised that there was not more paralysis, since the cord appeared to be compressed within narrow limits by the displaced vertebra.

St. Thomas's-street, S.E.

## Clinical Notes:

### MEDICAL, SURGICAL, OBSTETRICAL AND THERAPEUTICAL.

#### CONVULSION TREATED BY COMPRESSION OF THE CAROTID.

BY T. GORDON KELLY, M.D. DUB.

In the issue of THE LANCET of Jan. 2nd I read an account of Dr. Leopold Roheim's treatment of eclampsia by compression of the carotid, and in a subsequent number an account of a case of convulsion where this treatment was successfully tried by Mr. W. C. Hearnden. A similar case occurred in my practice a short time ago, the following notes of which may be of interest.

Mrs. H—, a married woman aged sixty-four, had been under my care for over two years, suffering from chronic rheumatism, renal troubles &c. I had not seen her for some months previously. I rode off immediately, and on my arrival found the patient in a fit which I was told had lasted one hour and a half. The pulse was full, respiration noisy and laboured, and the muscles of her face and body were convulsed. I determined to try Dr. Roheim's treatment. Except for the force with which the carotid was beating, I found this comparatively easy to do, the woman being very thin. Within a few moments from placing my thumb on the artery the convulsions of the face and body began to cease, the respiration gradually became slower and deeper, and in about two minutes and a half she came out of the fit, looked around in a dazed way, and when I asked her if she was better, nodded her head in reply. Since then she has had no return of the attack.

Desford, Leicester.

#### A CASE OF TETANUS WITH DOUBLE FACIAL PARALYSIS; RECOVERY.

BY W. HUNTINGTON, M.R.C.S. ENG., L.R.C.P. LOND.

J. K—, aged fourteen, farm servant, fell and cut his head on Jan. 4th. The mother covered the wound with stamp plaster, which was allowed to remain adhering for a week. Pus was then observed coming from under the paper, so a poultice was applied and the dressing removed. A day or two after this he complained of stiffness in the jaws and neck, and this increased until the fifteenth day after the injury, when his jaws became firmly locked and he could scarcely swallow. I saw him for the first time on the sixteenth day after the injury. The wound, which had evidently been a badly contused one, was nearly healed, and rather more than an inch in length. It was situated on the forehead, running obliquely upwards and to the left from a little above the root of the nose. He was sitting in a chair and would not lie in a bed, since he found the latter position more irksome and caused worse exacerbations. He could not endure darkness or noise, and required a light all night. His jaws were close together and rigid; masseter, temporal and sterno-mastoid muscles firmly contracted; intellect clear; face expressionless; when asked to smile, he said he could not; nor could he properly close his eyes. There was complete paralysis of muscles of both sides of the face. The pupils reacted to light and accommodation and the movements of the eyes were normal. He suffered from frequent cramps in the legs and abdomen. His arms moved awkwardly, and the grip of the hands was feeble. Dysphagia was a prominent symptom.

There was a profuse flow of saliva, which ran out of his mouth; he suffered much from sleeplessness, for many days and nights only obtaining a few minutes' sleep at a time. He was given a mixture of chloral hydrate with bromide of potassium and tincture of hyoscyamus every three hours, and at night he had opium in addition. In a week's time the paralysis on the left side of the face began to subside, and in another week the right side did likewise, and he was then soon able to whistle, smile &c. At first he could not walk, but after a fortnight he could do so with assistance; and his action was peculiar, each leg being moved forward from the hip as if rigid through its length, the foot dragging along the ground. The symptoms gradually subsided, and in six weeks he was practically well and able to go away for a change. A short time ago (June) I saw him, and he was in perfect health.

This case reminds one of the form described by Rose of Zürich, and called by him "cephalic tetanus"; but, so far as I am aware, only one side of the face was paralysed in the cases mentioned. From the dysphagia and irritation caused by noise and movement the term "hydrophobic tetanus," already used to some cases of this disease, would here be an apt one.

St. Andrews, N.B.

#### THE IMPORTANCE OF OBSTRUCTION TO THE OUTFLOW OF URINE AS A CAUSE OF PUERPERAL ECLAMPSIA.

BY G. E. HALE, M.B., B.C. CANTAB.

THE following brief note concerning a necropsy which I performed a short time ago may be of value to those who, like myself, were interested in Mr. Gifford Nash's paper, published in THE LANCET of Aug. 27th, on the above subject. The girl had died of double pleurisy with a little pneumonia, which had commenced suddenly with a rigor six days before her death. She was pregnant for the first time with a six-months' fetus. Both ureters from the kidneys to the brim of the pelvis were dilated up to the size of the common iliac artery, while the kidneys were in a condition of slight hydronephrosis, with much congestion of their substance. No obstruction could be found within the canal of the ureters to account for this distension, and the whole condition strongly suggested that the ureters had been obstructed from without by the pressure of the pregnant uterus. The urine during her stay of four days in the hospital was highly albuminous and contained also a trace of deuterio-albumose.

#### ST. BARTHOLOMEW'S HOSPITAL.

OSTEO-SARCOMA OF THE HUMERUS WEIGHING THIRTY-THREE POUNDS AND MEASURING THIRTY-ONE INCHES IN CIRCUMFERENCE; LIGATURE AT THE SUBOLAVIAN ARTERY AND AMPUTATION AT THE SHOULDER-JOINT; RECOVERY.

(Under the care of Mr. HOWARD MARSH.)

THIS case is worthy of being recorded, for the tumour must be one of the largest ever removed with the upper extremity. The history of the case points to the formation of a cartilaginous tumour in the first instance, and after some years the rapid development in that of sarcomatous tissue. Pollet<sup>1</sup> reported last year a case of large osteo-sarcoma of the femur, which was supposed to have been in existence for twenty-five years. The success of an operation for such a large growth as this depends very much on the efficient

<sup>1</sup> Journal des Sciences Médicales de Lille.

control of the hæmorrhage; and Mr. Marsh found ligature of the subclavian most satisfactory, for it appears that the quantity of blood lost did not amount to much more than six ounces.<sup>2</sup> The other methods which are at the disposal of the surgeon for the arrest of hæmorrhage during this amputation are briefly: (1) Pressure on the subclavian; (2) compression of the inferior or anterior flap; (3) ligaturing or twisting of the vessels on the inner aspect of the limb before they are cut; (4) securing the vessels lower down in the Furneaux-Jordan method; (5) the use of an indiarubber band; on account of the liability of this to slip it has been suggested by Kock that a section of the outer third of the clavicle should be made, and after a preliminary bandaging of the arm the tube should be passed round the shoulder and through the gap in the clavicle, loops of bandage being used to hold it in position.

W. H.—, aged forty-nine, a labourer, was admitted into St. Bartholomew's Hospital with a tumour of the right upper arm. He stated that ten years previously he noticed the formation of a hard swelling which felt like bone on the front aspect of his arm close to the shoulder-joint. Having in the course of two or three years reached about the size of an orange, the tumour remained stationary for six or seven years. Two years and a half ago the swelling appeared lower down. This increased rapidly, and soon the whole upper arm was enlarged. A year ago the limb measured twenty-five inches in circumference. He had lately lost power and sensation in the forearm, which was now flabby and much wasted. He had lost flesh and strength in the last month, and during this time the swelling had rapidly enlarged. (See engraving.)

The patient presented an extraordinary appearance. It is scarcely an exaggeration to say that his arm looked at first sight almost as big round as his thorax, with which, owing to its bulk, it stood off almost at a right angle. Its circumference at its largest part was thirty-one inches. The forearm by comparison looked small and withered. The tumour was roughly barrel-shaped, irregularly nodulated and bossed, some of the low-crowned nodules being of the size of an orange. The original mass (now as large as a cocoanut) was as hard as bone, while the remainder, which had developed chiefly in the last three years, was for the most part firm or more or less elastic, like a fleshy sub-periosteal sarcoma. The skin over the tumour was tense and shining, pale and waxy, from distension over the upper part, but congested and almost livid lower down. A network of large tortuous veins ramified over the surface, and many of them towards the front of the axilla were as big as adult fingers. No secondary growths could be detected. The tumour was evidently a sub-periosteal sarcoma. The

patient's condition was distressing. The tumour had reached such a size and weight that he found it difficult to balance himself as he walked; he was obliged to support the swelling so far as he could with his other hand; he could lie only on his back, suffered considerable pain, looked pale and worn, and was rapidly losing flesh and strength.

On examination it seemed quite possible to remove the arm at the shoulder-joint without any very grave risk to life, for the tumour was engrafted upon the trunk by a somewhat narrow neck, so that the wound left after the amputation would be comparatively small. A few days later the operation was performed. The chief danger, of course, to be guarded against was that of hæmorrhage, not only from the arteries supplying the tumour, but from the enormous veins which were seen running over its surface. To meet this the subclavian artery was first tied in the third part of its course, and the arm was then elevated so as to empty it of its venous blood. The artery lay at a considerable depth from the surface, for the clavicle was forced upwards out of its normal position; but as all the tissues around the vessel were natural it was reached without any great difficulty. When the arm was raised the veins—as no blood was now entering—quickly emptied themselves, and thus the limb was rendered, comparatively speaking, anæmic. A large skin flap was then dissected up from the upper and outer part of the tumour, the joint was opened and the second flap formed by cutting from within outwards. As the afferent vessel had been already tied and the venous blood emptied back into the trunk, the amount of hæmorrhage was quite insignificant and was estimated at the time not to have exceeded six ounces. No case could show more conclusively the value, in amputation at the shoulder-joint for the removal of large tumours, of the preliminary ligation of the main artery of supply and the draining of the veins. The artery in this instance was so deeply placed that—even if the skin and deep fascia had been divided, as originally suggested by Syme—it could not have been securely compressed, for, in the manipulation of the limb which was necessary during the amputation, the thumb or finger would inevitably have been lifted off the artery and fatal hæmorrhage would have occurred. Besides, it is only when the entrance of blood by the main artery has been entirely prevented that the veins can be efficiently emptied. It was suggested by some who saw the case that the subclavian vein, as well as the artery, should be tied. But there were two considerations, which taken together seemed to be conclusive against this course. In the first place, ligation of the subclavian vein must always be a more difficult proceeding than ligation of the artery, and the vessel in this case, owing to displacement of the clavicle, was lying at such a depth that I doubt if it could have been safely reached without removing part of the clavicle. Secondly, to have tied the vein would have prevented the return of venous blood into the trunk; so that instead of saving loss of blood, it would have largely increased it. In the course of the operation it was found that the skin on the axillary side had become so thin over the tumour that it seemed unsafe to leave it. The flaps were therefore too short to entirely close the wound, but the edges were brought together as far as possible, and the surface left open for subsequent granulation was only about three inches square.

The patient bore the operation well, and his subsequent progress was quite favourable. The wound healed aseptically, and the temperature was never above normal. He was up on the tenth day. When seen recently, he looked well and had regained flesh and colour.

#### BRISTOL GENERAL HOSPITAL.

A CASE OF DISLOCATED CALCAREOUS LENS CAUSING SYMPATHETIC IRRITATION; EXCISION.

(Under the care of Mr. CYRIL H. WALKER.)

T. F.—, aged fifty-five years, came to the Bristol General Hospital on Aug. 21st, 1891, complaining of pain in his left eye and failing sight of his right. In 1857 he appears to have received an injury from a gunshot accident. A single shot struck the lower part of the left eye; the sight was immediately destroyed, and there was some bleeding from the wound. The eye was examined by a medical man, but the shot could not be found. The patient was kept in a darkened room for a few days. The eye rapidly quieted down, and gave

<sup>2</sup> Jacobson: The Operations of Surgery, p. 112, 2nd edition.

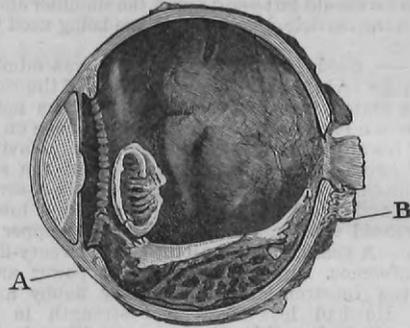

very little pain. In three weeks from the time of the accident the injured eye, though totally blind, was painless and hardly at all disfigured. The eye continued in this condition for nearly thirty-four years, and no information could be gained from him as to whether any opacity had appeared in the pupil indicating changes in the lens. But in April, 1891, four months before admission, the blind eye began to be uncomfortable at times. He stated that soon after this (about the end of June) he was quite sure he felt "the shot rolling about" in his eye. After this the eye gradually became more painful and he repeatedly felt the sensation as of some foreign body rolling about in his eye. On Aug. 13th he noticed that the sight in the right eye, which had hitherto been quite perfect, began to be affected, whilst the left eye became acutely painful.

On admission the left eye was quite blind and extremely painful, the pain extending all round the orbit; the tension was slightly increased. He was constantly mopping the eye with his handkerchief, and in doing so had caused an abrasion of the lower part of his cornea. The rest of the cornea presented a ground-glass appearance, rendering the iris only dimly visible. There was a moderate amount of conjunctival and ciliary injection, and at the lower and inner side, at the posterior part of the ciliary region, there was a small dusky patch, being the scar caused by the wound. So far as could be judged through the hazy cornea, the anterior chamber was deeper than normal; the pupil was moderately contracted and did not respond to light. There was no opacity visible in the pupil. He was still quite confident that he could feel a foreign body rolling about whenever he moved his eye. Atropine and cocaine were applied several times but produced no dilatation of the pupil and no trace of foreign body or lens was visible. The right eye was weak and watery and there was marked photophobia. Distant vision was  $\frac{3}{8}$ , but he was unable to look at ordinary print for more than a few seconds at a time. Media clear; no ophthalmoscopic changes. The tension was normal, but the globe was decidedly tender. There was hippus of the iris, and he complained of seeing "floating specks." In short, the right eye was in a condition of sympathetic irritation.

Thinking that it was almost certain that there was a foreign body in the left eye, and as it was totally blind and very painful, he was strongly advised to have it removed. This he refused to submit to, so palliative treatment was adopted. After ten days the condition of his eyes remained practically the same, and he willingly consented to have the eye excised. A fortnight later V.R. =  $\frac{5}{6}$  and J. 1. The eye was perfectly comfortable, and has remained so up to the present time. The globe measured twenty-two millimetres in transverse diameter. On making a vertical section through the frozen eye the lens was found to be dislocated and remarkably calcareous, being reduced to a skeleton or framework, from the interstices of which all the soft lens matter had been absorbed. It was of nearly normal size and consisted of a fairly uniform outer shell of hard material like egg-shell, with a few radiating clefts and grooves near the periphery, while the interior of the lens was converted into loosely adherent particles or flakes, forming a sort of cancellous structure. (As the globe was not quite frozen through the central part of the lens crumbled away to a great extent and was lost in the fluid vitreous. Hence in the mounted specimen from which the accompanying drawing is made only the concave outer shell is represented.) Examined under the microscope, some of these flakes when decalcified looked rather like bone, but no true bony structure existed. Sections of the decalcified cortex showed lens fibres quite distinctly in many places. No trace of lens capsule or of suspensory ligament was visible. The shot went completely through the eye, entering in the ciliary region (A) and going out a little below the optic nerve. It could not be felt at the time of enucleation, and is probably lodged deep in the tissues of the orbit. From the course taken by the shot it seems likely that it also wounded the optic nerve further back in the orbit, which would account for the total and permanent blindness of the injured eye. The point of its exit from the globe is marked externally by a raised lump (B) close to the optic nerve, consisting of strands of fibres running backwards from the sclerotic. In the track of the shot is a firm, white, glistening band of fibrous tissue, looking much like a piece of tendon, stretching from A to B, and raised about an eighth of an inch from the sclerotic. The retina is detached, and rises up to meet this band on each side, and so forms two shallow pouches or depressions. The small space between the retina and choroid seemed to be full of clear fluid. The detached

portion of the retina is much pigmented, so as to present a dark speckled appearance.

There are several points in this case which make it of interest, and the occurrence of distinctive changes in a damaged eye so many years after the infliction of the injury is very unusual. Mr. Walker remarks that although partial calcification of old cataracts is not very uncommon, yet text-books say very little on the subject, and it is hard to find any records of such extensive changes as this case presents. The fact that it also caused sympathetic irritation adds further interest. A rather similar case is related in the *Medical Times and Gazette* of 1853. Dr. Taylor speaks of the con-

Left Eye. Vertical section,  $\times 2$ . A, Entrance of shot. B, Exit. Half of the dislocated lens is shown in the position it occupies now the specimen is mounted in glycerine jelly.

dition as being of very rare occurrence. In that case the globe was shrunken, but in spite of this the cataract was extracted, though with great difficulty, and the eye did well. If the patient's statement that the pupil of the injured eye was quite black, and that "no one would know that the eye had been injured," be correct (and he seemed quite certain about this point), the lens must have been almost completely dislocated, gradually become calcareous and eventually broken from its few remaining attachments. It is not easy to explain why a dislocated lens should become calcareous, for though it has been shown (by Mr. Priestley Smith and also by Dr. W. J. Collins) that the amount of solids in a senile cataract depends on the age of the cataract and not on the age of the patient, yet so advanced a change could hardly be accounted for by this ordinary process even in thirty-four years.

## Reviews and Notices of Books.

### SOME GERMAN CLINICAL MANUALS.

- Lehrbuch der Auscultation und Percussion.* Von Dr. C. GERHARDT. Fünfte Auflage. Tübingen: H. Lapp. 1890.
- Lehrbuch der Klinischen Untersuchungs-methoden für die Brust und Unterleibs-organe.* Von Dr. PAUL GUTTMANN. Achte Auflage. Berlin: A. Hirschwald. 1892.
- Diagnostik der Inneren Krankheiten auf Grund der heutigen Untersuchung-methoden.* Von Dr. OSWALD VIERORDT. Dritte Auflage. Leipzig: F. C. W. Vogel. 1892.
- Medizinische-klinische Diagnostik: Lehrbuch der Untersuchung-methoden innerer Krankheiten.* Von Dr. FELIX WESNER. Berlin: Julius Springer. 1892.
- Grundriss der Klinischen Diagnostik.* Von Dr. G. KLEMPERER. Dritte Auflage. Berlin: A. Hirschwald. 1892.

THE works named above are for the most part well known. Only one of them is of quite recent date—namely, Dr. Wesener's the rest are new editions, which in every case are said to be improved and extended. Truly, of the multiplication of clinical manuals there is no end. We have only to recall the number of works of this class that have been produced in this country during the past decade to find illustration of this. The student is embarrassed in his choice, but fortunately most of these text-books of the art and science of diagnosis are reliable, differing mainly in the extent to which

the writers descend to detail and intersperse theoretical considerations with their practical teaching. Germany has been even more prolific than England or America in the production of high-class diagnostic manuals, although twenty-five years ago, when Dr. Gerhardt's work first made its appearance as a worthy successor to Skoda's famous Manual of Auscultation, there were but few such books in the field. And within the limits of its subject—limits which the author has increased since he first produced his book—this work of the Berlin professor still maintains a leading place. It is not only thoroughly sound in its teaching, but is comprehensive and original; and although the author in his preface hints that other methods—e.g., microscopical examination of sputa—seem to some to be all-sufficient for diagnosis, few will venture to dispute the necessity for thorough physical examination of the patient if diagnosis is to be accurate, prognosis sound, and treatment rational. As to the general plan and scope of these several works, it may be said that Professor Gerhardt deals in turn with each of the physical methods as applied to the examination of thoracic and abdominal organs, and then discusses in detail the various signs presented by certain morbid conditions of these parts. Dr. Guttman, whose work was in one of its earlier editions translated by the Sydenham Society, covers the same ground, but embraces in his pages chapters on examination of the larynx, of the blood, sputa, urine &c. Dr. Vierordt's book, recently translated into English (Pentland), is still more complete, treating very fully of the diagnosis of diseases of the nervous system, in addition to the subjects dealt with by Dr. Guttman. Dr. Wesener's more recent book is of the same scope as Dr. Vierordt's, but is less detailed. It is well illustrated by lithographs, but in the matter of diagrams and woodcuts, many of great excellence, Dr. Vierordt's book takes the palm. Dr. Guttman's work is not illustrated, but Professor Gerhardt's has several semi-diagrammatic sketches, which are of much utility. Lastly, the little work by Dr. Klemperer, less ambitious than any of the foregoing, is admirably compiled, concise and clear; it traverses the whole field of medical diagnosis and includes all that is really essential. It is just the sort of manual for a student to have constantly by him in his ward work.

In order to give a concrete example of the different modes adopted by these authors of dealing with their subjects we may take, for instance, the much-debated question of the cause of the vesicular murmur, and see how it is treated by each writer. Professor Gerhardt discusses the subject at some length, and traverses the statement originated by Penzoldt, and now most in favour, that the murmur is really tracheal breathing altered by transmission through the spongy lung tissue. He points out that in stenosis of the air passages the sound due to the contraction is conducted to the surface, but does not replace vesicular breathing; that the latter can be heard over the chest in tracheotomised subjects; and that the almost purely inspiratory character of the vesicular murmur contrasts with the greater development of the expiratory portion of the tubular breath sound. From these and other considerations he concludes that the bruit must be produced in the pulmonary tissue itself, not by currents of air or by friction of air against the walls of bronchioles and alveoli, nor even by the combination of the myriad "veines fluides" which theoretically may be conceived to occur where the infundibula open into the air sacs. Dr. Gerhardt holds that the murmur bears the same relation to bronchial or tracheal breathing as the percussion note over lung tissue bears to that over the trachea. In each case there is a similar alteration in pitch, tone and clearness. We may note in passing that several years ago (1886) in these columns Dr. Coats, by his examination of a patient whose larynx had been extirpated, arrived also at the conclusion that the vesicular murmur was generated in the lung tissue itself, and not at the glottis. However, if we turn to Dr. Guttman we find

that, whilst admitting the inherent difficulties of the question, he inclines to the view, which he says has of late come to be generally held, that the larynx is the source of all respiratory murmurs, and that vesicular breathing is only a modified laryngeal sound. It cannot be, he says, that the murmur is produced either by rapidity of the air-current or by eddies produced at the junction of the bronchioles and infundibula. At the same time he sees the difficulty of admitting the glottic origin exclusively, since a feeble vesicular breath sound is to be heard over the lungs of tracheotomised subjects. Drs. Vierordt and Klemperer content themselves by stating the accepted view of the glottic and tracheal origin of the murmur, the latter not hinting at any other explanation; whereas Dr. Vierordt abstains from discussing theories which, he says, have no positive proof to sustain them. Dr. Wesener passes the subject by in silence.

Upon another point—that of the murmurs of mitral stenosis—there is practical unanimity, although there is some divergence in detail, and not one author mentions the view, so much debated in this country on more than one occasion, that these murmurs are really of regurgitant origin. Professor Gerhardt says the characteristic, loud, grating or sawing bruit is diastolic, or more often partly diastolic and partly systolic, commencing towards the end of diastole and prolonged through part of the systole. He notes that sometimes the diastolic element of the bruit is only elicited by increasing the action of the heart; and he explains the fact of the usual late development of the diastolic element by the contraction of the auricle, which comes at the end of the diastolic period, suddenly increasing the swiftness of the current. Dr. Guttman also sees that the diastolic character of the murmur is due to its being formed by eddies at the contracted orifice; and he notes, as distinguishing it from other diastolic bruits, the fact that it is not uniform, but constituted of two or even three cadences, which pass into one another, the bruit increasing in intensity towards the end of diastole (presystolic period), because then the pressure of the stream on the orifice is suddenly enhanced by the auricular contraction. Of course, he notes the frequent concomitance of a systolic bruit and also the short, loud first sound that may abruptly terminate the stenotic murmur; whilst he says that in some cases a reduplicated second sound is the only evidence of mitral stenosis, a murmur being absent. Dr. Vierordt does not enter into much detail, but gives the accepted view of the character and cause of the presystolic bruit. His diagrams are explicit and accurate. Dr. Wesener says the murmurs of mitral stenosis may be diastolic or presystolic, the latter occupying the second half of the diastole and being of a crescendo character, ending in a loud flapping first sound. Such a bruit is only produced at the mitral valve and is invariable organic, being evoked by the auricular contraction forcing the blood current through the stenosed orifice. He says that there is often (?) a diastolic bruit of uniform character occupying the rest of the diastole and merging in the presystolic, and he correctly adds that the crescendo character of the latter is sometimes wanting—e.g., in cases of fatty heart. Dr. Klemperer merely says that "a diastolic (presystolic) murmur over the mitral valve implies mitral stenosis."

It may also be of interest to learn what these authorities teach upon the significance of intermittent albuminuria, a matter which is still *sub judice*. It is not referred to by Dr. Wesener, and is mentioned by Dr. Vierordt as being of a cyclical character, occurring mostly after exercise, never after a night's rest, and not being accompanied by any other signs of renal disease, especially casts. Dr. Guttman mentions various authors who have recently drawn attention to this condition of transitory albuminuria in healthy subjects, noting that the albumen is mostly small in quantity, although Leube found as much as 0.03 to 0.06 per cent. Its dependence on muscular exertion is illustrated in the case of soldiers on the

march, in whom the albumen appears in the urine at noon, but not in that passed in the early morning. Depressing emotion may be a cause of the phenomena. Dr. Klemperer says it may occur in healthy young people, and although the idea of nephritis cannot be excluded, yet in several cases it has disappeared. We may remark, in conclusion, that in each of these books the chemical and microscopical aids to diagnosis are treated with sufficient fulness, and that electricity is amply dealt with by Dr. Vierordt, and to a certain extent also by Drs. Wesener and Klemperer.

*Manuel d'Ophthalmologie.* Par le Docteur E. FUCHS, traduit par le Dr. C. LACOMPTÉ (de Gand) et Dr. LEPLAT (de Liège). Paris: Georges Carré, Editeur. Pp. 815. 1892.

THIS large and important treatise is a translation of a very well known and highly esteemed work written by the Professor of Ophthalmology in the University of Vienna, and therefore presents the views and practice of that school. Dr. Fuchs states that he was induced to write it because he disapproves of the plan of students taking long notes at lectures, and especially at clinical demonstrations, when they ought to be attending to the objects presented to them; and hence, if they are so anxious to have his very words in black and white, he thought it expedient to let them have them direct and fresh from his own pen. The book does not pretend to be exhaustive, but is a useful guide to the practitioner. Those who intend to take up the diseases of the eye as a special branch of work must, he admits, study the larger treatises.

The general arrangement of the chapters is, in accordance with the usual practice of writers on the diseases of the eye, topographical; the conjunctiva, cornea and sclera, iris, choroid and retina being taken in succession; then the lids, lacrymal apparatus, ocular muscles and affections of the orbit. Errors of refraction and accommodation are next considered and the operations are described in a final section. Following the example of Arit, Dr. Fuchs devotes much space to the consideration of the diseases of the superficial structures of the eye, as the conjunctiva and cornea. In severe cases of gonorrhoeal ophthalmia he recommends scarifications of the conjunctiva and the administration of full doses of mercury internally, with inunction of blue ointment externally—proceedings that are not considered advisable in this country. He adds, however, that he has not had much success with them. Slight cases of pannus resulting from trachoma disappear under the influence of cauterisation of the conjunctiva. In more severe cases he seems to approve of the method suggested by de Wecker of jequirity injections which we thought had been entirely given up even by its author. For fistula of the cornea he recommends rest in bed, a light bandage, the instillation of some myotic remedy and iridectomy. Cauterisation of the edges he thinks to be not without danger. He does not allude to refreshing the edges and the introduction of a suture. Tattooing the cornea in cases of leucoma is recommended to be performed with a fasciculus of needles or with a grooved needle; it should have been observed that the tattoo marks usually disappear quickly unless the punctures are made obliquely. Under the head of Uvea a good description and diagram are given of the lymphatic channels of the eye. Dr. Fuchs only admits a sphincter iridis. The posterior surface of the iris, he says, is formed of strong and regularly arranged fibres, which extend from the ciliary to the pupillary border, and which, on this ground, have been considered to constitute the dilator of the pupil. The dilatation of the pupil, however, is not effected by a muscular contraction but by an elastic retraction, and the fibres in question, having no nuclei, cannot, he thinks, be considered as smooth muscle. The diseases of the iris and of the ciliary region are treated with much fulness and care. A well-written chapter is devoted to the diseases of the optic nerve,

commencing with an account of its anatomy, its central origin and the effects of lesion of different parts of the nerve and tract, and passing on to the consideration of intra-ocular and retro-bulbar neuritis. The author arranges the causes of intra-ocular neuritis in the following order: Diseases of the brain and syphilis; acute febrile diseases, such as scarlet fever, measles, small-pox and diphtheria; troubles of nutrition, such as albuminuria, diabetes, scrofula and pregnancy; acute anæmia from hæmorrhage, lead poisoning; heredity; exposure to intense cold; orbital disease, such as tumours and growths in the nerve itself. He gives tobacco amblyopia as the type of chronic retro-bulbar neuritis; but many of the causes of intra-ocular neuritis are also to be enumerated as causes of retro-bulbar neuritis. A section is devoted to visual disturbances without appreciable lesion, which of course includes colour-blindness and which is well written. The illustrations are very creditable, and the translation, though it requires a Frenchman to speak with authority upon this point, seems to convey the sense of the original.

*The Biographical Dictionary.* Edited by SIDNEY LEE. Vols. XXX. and XXXI. London: Smith, Elder and Co.

THESE volumes compass the letters JO—KE to KE—LA, and include the names of many members of the medical profession, the majority of them, however, being but little known, either personally or by their writings, to the present generation. Dr. C. Handfield Jones and Dr. Bence Jones, however, will be remembered by our readers—the former, as physician to St. Mary's Hospital and for his "Clinical Observations on Functional Nervous Disorders"; also as joint author with Dr. Sieveking of a valuable "Manual of Pathological Anatomy." Dr. Bence Jones, physician to St. George's Hospital, devoted his attention chiefly to chemistry in its application to medical research and practice. His work on "Animal Chemistry in relation to Stomach and Renal Diseases" is still esteemed a high authority on the subject. Thomas Johnson, M.D., who died in 1644, was said to be the best herbalist of his time in England. Arthur Johnston, M.D. (A.D. 1587–1641), was more distinguished for his Latin verse than for his medical acquirements. Charles Aston Key (A.D. 1793–1849), surgeon to Guy's Hospital, was famous alike for his lectures and for his operations. He was one of the first elected Fellows of the Royal College of Surgeons of England, and was appointed surgeon to Prince Albert. This Dictionary when finished (it has now reached the twelfth letter of the alphabet) will form an indispensable part of any library which claims to be complete.

**THE DUTIES OF WATER COMPANIES.**—The East London Water Company were fined 40s. at Worship-street Police-court on Wednesday, for neglecting to comply with the requirements of the Public Health Act by not giving notice in writing that a certain house within the limit of their supply had ceased to be supplied with water by the company. The 49th section of the Act (which has only recently come into force) cast upon water companies the duty of giving notice to the sanitary authority of the parish where a house had had the supply of water removed within twenty-four hours.

**SANITARY PRECAUTIONS.**—Charles J. Smith, owner of lodging-houses in Great White Lion-street, appeared before Mr. Vaughan at Bow-street on Wednesday in answer to summonses by the St. Giles District Board of Works for offending against certain sanitary regulations, principally the non-removal of rubbish. The defendant was conditionally remanded on plea of being away for a holiday. Under the same regulation Henry Edwards, of 535, Fulham-road, was summoned. The medical officer stated that thirty people were living in a house in Betterton-street. The defendant was fined 40s. and ordered to put the house in good condition within three days. Two other cases were adjourned for a week and on another a fine of 6s. was imposed.

# THE LANCET.

LONDON: SATURDAY, SEPTEMBER 17, 1892.

ON Aug. 20th we published the report of our Special Commission on Sanitation in relation to the Law and Practice of House-letting. Suspecting not only that sanitary defects were largely prevalent in houses in all parts of the country, but also that the general public were ignorant of the importance of these defects in their relation to health, and that landlords were unable either from lack of knowledge or from interested motives to enlighten the minds of proposing tenants, we submitted a series of questions for opinion to a thousand house agents and surveyors, in the hope that from the information so gained we should be placed in a position to grasp the true facts of the case, and, if we were warranted by the evidence before us, that we might suggest for discussion some method or methods by which existing grievances might be corrected. We were able to affirm in the report that our suspicions had proved but too true, and that the matter was indeed one urgently requiring consideration at the hands of those in whom the authority to interfere is vested. In issuing our report we expressed a hope not only that the matter would arouse the interest of the lay press, and thus aid in the more effectual ventilation of the subject, but also that the conclusions at which we had arrived concerning the means by which the required reform might be attained would be searchingly canvassed; we anticipated, moreover, that possibly important suggestions might be advanced to help us in our task. We are gratified to be able to state that our labours have met with a hearty welcome and our expectations have been amply fulfilled. We now propose to pass in review the more important criticisms and suggestions that have been offered upon our report, but in order to make these clearly intelligible it will be best to briefly recapitulate the conclusions at which we arrived.

We expressed a strong opinion that every landlord should be made responsible for the proper drainage of his house, and that a clause guaranteeing the drainage should form part of the agreement in the letting of a furnished house. It is eminently desirable that this condition should be made applicable to all classes of property, whether let furnished or unfurnished. Starting with the assumption that the efficient drainage of houses should always be guaranteed, we discussed three possible methods by which the interests of the tenant in this matter might be safeguarded—viz. (1) by a combination of house agents and surveyors; (2) by further legislation compelling landlords to put the drains of their houses in order before letting such houses; (3) by awakening sanitary authorities to a sense of the power already entrusted to them, and requiring them to develop their latent authority for the public benefit.

Having for very obvious reasons dismissed the first of these suggestions, we advised the adoption of the third in preference to the second method, by an appeal

to existing sanitary Acts, showing clearly that the whole of the requisite authority to carry out the needed reform is already vested in local authorities. We also suggested that recourse should be had to a system of registration of houses with the local authority, who should also grant a certificate to the landlord provided his house attained to the standard of sanitary excellence which they required. We further recommended that registration should, at all events in the first instance, be voluntary and not compulsory, as we were able to adduce instances in which the former plan, having been put into operation, had been found to answer admirably. Of course, should the method prove a failure, the local authority would still have power to introduce more stringent regulations. We suggested an exception to this rule in the case of boarding-houses, lodging-houses and hotels, in which we are of opinion that registration should forthwith be made compulsory. It will of course be borne in mind that the reform for which we are now contending applies solely to the case of houses erected before the passing of the Public Health Acts. Houses built after these Acts have come into force should be drained in accordance with model by-laws drawn up by the local authority. Drains badly laid or not laid in accordance with the scheme set forth in the by-laws are a reproach to the sanitary authority of the district; for these there is no excuse.

Notwithstanding the immense number of notices that have appeared on the report of our Commission, opinion has been nearly unanimous that the case for reform has been established, although some misgivings have been expressed (notably in an appreciative leading article in the columns of *The Times*) about the means which we recommend to be adopted in order to secure it. In urging a system of voluntary registration of houses, we cited Eastbourne as an instance in point where the method had been tried with success; and in this connexion we would direct the attention of our readers to an interesting account furnished by Dr. SHERWOOD and published in another column of the system of registration now in use in that town; and since then we have been informed that a similar plan has been followed at Folkestone with good results. It has been pointed out to us that Eastbourne and other fashionable watering-places are scarcely fair examples to quote in support of our views. It is urged that Eastbourne, being a popular health resort and therefore doing an enormous business in the letting of houses and lodgings, is compelled, in order to attract visitors, to be jealously careful of its sanitary reputation; and it is considered very questionable whether in a place which is not a health resort, and therefore offers no inducement to the local authority to urge upon landlords the prime importance of placing their houses in irrefragable sanitary repair, the certificate of the sanitary authority will be as eagerly coveted and as much respected.

There is certainly no denying the fact that well-known health resorts offer peculiar advantages for carrying out satisfactorily a plan of voluntary registration. To achieve success with a system of voluntary registration in places having a less fluctuating population would doubtless require a far longer time, as it would demand that the public mind should be sufficiently educated to be alive to the importance of insisting on good sanitation and of considering it a duty to taboo

all houses not on the sanitary register. But while we may confidently look forward to the intelligent and well-to-do classes recognising the value of registration within a reasonable time, we are naturally asked how we propose to bring home the importance of the subject to the poorer portion of the community. Would not voluntary registration be a deplorable failure in this respect? To this we answer that some of these houses would be provided for by the Housing of the Working Classes Act. Some, being lodging-houses, would be compulsorily, according to the plan we have proposed, placed upon a special register, while the remainder—if the local authority exercised the power entrusted to them, and intended to be used by them, of thoroughly inspecting drainage—would be most completely cared for. When local authorities awoken out of the slumber with which their eyelids are still heavy, the public may expect to witness the dawn of a new day for sanitary science. The *Local Government Journal* thinks that matters would be expedited by the formation of a householders' league which should have for its object the scheduling of insanitary property in a list open to members only and containing the fullest information regarding the drainage, water-supply, rates &c. of the district. In the event of a system of voluntary registration being instituted, we think that this plan would put a powerful weapon into the hands of householders, and we commend it to their careful consideration.

While an appreciation of the value of voluntary registration would require an education of the public sense, it would be the duty of the public, once having grasped the importance of the subject, to insist on a high standard of excellence being required by the local authority before it grants its certificate. We need hardly say that we consider that this standard should be uniform in all districts employing similar plans of drainage, and that the conditions for its attainment should be laid down by a central authority.

While the majority of our critics have accepted voluntary registration together with compulsory legislation in the case of boarding-houses, lodging-houses and hotels, as sufficient to commence with, the *Daily Chronicle* and the *Star* do not consider that our recommendations have gone far enough, and would make the provisions of the Housing of the Working Classes Act of 1885, which provides that a tenement should be reasonably fit for human habitation before letting, applicable to all classes of property. It would certainly be a boon to the public could this be accomplished; but we venture to think that the Act, if applied unreservedly to such a town as London, would prove a veritable task of Sisyphus. In the first place what is meant by the term "reasonably fit" must be clearly stated. To leave these words to stand without further definition, as at present, would be at once to introduce a bone of contention between landlord and tenant and would inevitably lead to endless litigation. Having laid down the conditions which, when fulfilled, shall be deemed to make a house reasonably fit for human habitation, it is still necessary to bring the law into universal application. Both the *Daily Chronicle* and the *Star* advise recourse to compulsion, mainly on account of the poorer class of tenant, who, having neither the means nor the time to defend himself against the impositions of the landlord, would be obliged to submit to any injustice inflicted on him. We have pointed

out above the means by which we think the poor tenant would be protected effectually against the encroachments of the landlord. But let us suppose every kind of household property in London brought under the conditions of the Housing of the Working Classes Act. For the purposes of efficiently carrying out the principle of compulsion each vestry would require to employ a host of sanitary inspectors simply to survey houses and report as to their sanitary condition. When all the houses in the district had been inspected and put in good sanitary repair, an army of inspectors would still have to be maintained to make periodical inspections and correct existing defects; for in the event of any serious flaw in the drainage having been overlooked, the local authority being the only authority empowered to express an opinion as to the fitness of a house for occupation, would also be held the responsible one. We cannot but think that the general application of the Act would prove in the end an impossible task—at all events under the present conditions of local government by vestries; and we are therefore inclined to adhere to our original advice that voluntary registration should first be given a trial.

---

THE short paper on "Culture and Professional Success" which appears in the current number of the *New Review* from the pen of the late Sir MORELL MACKENZIE raises an issue which is always one of very great practical importance, and which is most pertinent at the present epoch. All educational methods are being subjected to the most stringent scrutiny, and the medical profession has been, and still is, engaged in revising its curricula and extending its period of study. Hence, an article like that cited, raising the great question how far general or "liberal" culture, as contrasted with special, technical, and professional education, is conducive to professional efficiency and success is worthy of careful attention. The article is strongly in favour of a wide general culture as the best preparation for the more special training which every profession demands from those who aspire to enter it. The author's grounds are various, but they may be summed up under two heads: first, that such culture confers breadth and flexibility of mind and renders the acquisition of special knowledge easy; and, secondly, that it develops a knowledge of human nature, and hence assists in enabling us to treat our clients or patients, not as mere "cases," but as complex, sensitive, and highly organised men and women.

This issue, ancient as it is, appears likely again to be fought out in our own day. There is a strong utilitarian wave of opinion now prevalent, and it is becoming generally assumed as an axiom that all training for a profession should be directed to the special needs and work of that profession, and that liberal studies, however pleasant or refining, must, in the stern struggle for existence, make way for subjects more practical and more immediately and obviously useful. From these causes arise the sacrifice of Greek, the limited study of Latin, the ignoring of English literature, and, on the other hand, the concentration of attention upon physical and biological science. We are no advocates of any abortive and anachronistic attempt to turn medical students into classical or literary pedants as a preparation for the work of the hospital ward or the consulting-room; but we would remind those most imbued with the spirit of the new era that the

preparation of the intellect for the reception of knowledge is an object hardly less great and urgent than the character of the knowledge which is to be imparted. We all admit that some such preparation is indispensable. The greatest enthusiast for science will hardly affirm that chemistry, physics and biology afford a sufficient basis for an all-round intellectual development. They are no doubt most important, but their successful prosecution would still leave the student ignorant of the history of his race and of many of the highest and noblest achievements of the human intellect. In medical education we desire, with as little waste of time as possible, to bring trained and disciplined minds to bear on the problems of disease, and the question is in what manner this can be best effected. Many will accept this putting of the case and will ask with derision how the Differential Calculus, the subtleties of Greek grammar, or the Categories of KANT are likely to be helpful. A sneer of this kind, however rhetorically effective, is not conclusive. The medical student needs strength and grasp of mind; the capacity to note resemblances and differences; the power of determining what amount of evidence is sufficient to warrant a given conclusion; some capacity of reading character, so as to estimate correctly a patient's statements and to eliminate the personal equation. He needs to be cautioned against haste, inaccuracy, prejudice and preconceived opinions, fallacious reasoning, confused or contradictory ideas, want of tact and many other things. These are formidable requirements, and the question is whether they can be met by any process less tedious and troublesome than that involved in a good preliminary education. The great danger of medical education at the present day is that raw youths with wholly unformed minds and destitute of any correct ideas regarding observation, evidence, and reasoning, should be set to dissect snails, mussels, and frogs, to look down microscopes, and to handle test-tubes, and come to imagine that little else is necessary. If such methods should extensively prevail, we believe the results would be quite as disastrous as those which flow from an excessive devotion to the Greek digamma or the higher geometry. Cardinal NEWMAN says in one of his works that we have ample proof that the old methods of instruction by means of the classical languages and mathematical studies are capable of producing flexibility and grasp of mind, and that we have no proof that any other methods are adequate for this purpose.

Apart from purely professional work, we have to consider how best we can promote that mental attitude which helps the practitioner to understand his patient not only as the subject of disease but as a human being. In the article alluded to above it is justly observed that professional success depends not only upon the power of giving good advice, but upon the capacity of so influencing our patients that they will be inclined to follow that advice when given. Many of the greatest practitioners of medicine have a magnetic influence in this way; but for those not thus exceptionally endowed there is no means of acquiring this power so likely to be successful as a wide knowledge of different subjects—in other words, a good all-round culture. This should enable the possessor to understand different types of mind, to enter into their point of view, and to sympathise with their various difficulties and apprehensions.

We may ask, finally, why so deep a prejudice should exist against the higher culture as a preparation for the professions. We believe the answer given in the paper in the *New Review* is the correct one—viz., that in some cases liberal culture disinclines the mind to devote itself heartily to what are often the dreary details of technical professional knowledge. We are reminded that Sir BENJAMIN BRODIE acknowledged that, nourished as he had been on classical literature, he had great difficulty in bending his mind to the dry details of anatomy. His subsequent greatness is the answer to those who maintain that literary culture is a hindrance to scientific eminence and professional success.

By the death of Sir GEORGE MACLEOD, recorded in the Obituary column of THE LANCET of last week, Scotland has lost a representative of medical and surgical science who combined all the qualities that make the beloved physician or surgeon, or say rather the beloved practitioner of the healing art, in more than an ordinary degree. Glasgow, his native city, has to mourn its loss in a special sense. Glasgow is a city that has responded well to its motto, "Let Glasgow flourish," and in nothing more than its medical celebrities. CULLEN led the way, BLACK followed, and since their time there have always been one or more men of mark—at least in physic—in that city. That she has often maintained three schools of medicine in brilliant contest one with another is of itself good evidence of medical fame. Sir GEORGE MACLEOD represented as a professor two of these schools—Anderson's College and the College or ancient University, a position which the late Professors ANDREW BUCHANAN, EASTON and LAWRIE held before him; for Anderson's College was not merely the nursing mother but also the rival of the older and greater institution. In the College Sir GEORGE MACLEOD occupied the chair of Surgery, succeeding Professor LAWRIE, who was in turn successor of the famous Professor JOHN BURNS, the author of one of the most practical treatises on Midwifery the profession ever possessed. These three professors of surgery in the old University had their own and distinctive qualities of fitness. Professor BURNS was of the old school. He commenced practice in the Saltmarket, and did not disdain in his first days to keep what he afterwards called "a conspicuous surgery," the shutters of which he would, on emergency, put up "wi' his ain hands," and, respecting practice, then and there told afterwards to his admiring classes many a good story. He dressed to the last in the old courtly style and carried it splendidly: knee breeches, buckle shoon, long waistcoat, with open front and flowing shirt frill, and coat like that still worn by Queen's counsel—a truly becoming attire. His classes in the College after he became possessed of the surgical chair were crowded, until his successor Professor LAWRIE began to teach at Anderson's College, when the attendance faded a little. He was a quaint lecturer, and his faithful janitor, "Jock," a marked favourite with the students, and ever at hand during lecture, was literally a worshipper, who from long familiarity with his duties looked on himself as a kind of sub-professor who need not hesitate to speak out an occasional drollery that passed as "Jock's last," long before Mr. GANDER attained the same celebrity. Professor BURNS was lost in shipwreck on board the ill-fated *Orion*, a fine

steamer that ran between Liverpool and Glasgow before the direct railway communication from London to North Britain was opened, and was found, it was reputed, on his knees dead. There is an excellent picture of him, in the act of lecturing, which his old friends and pupils dearly prize. Professor LAWRIE was a man of different stamp, a bright, active man absorbed altogether in his professional work, thinking of surgery and the doings of surgery from morning to night. He was a perfect operator. DE MÉRIC, who studied under him, and who afterwards for so many years conducted the *Mirror of Hospital Practice* for THE LANCET, said of him in his French way that he operated "avec la rapidité d'éclair"; and Sir WM. FERGUSSON always spoke of his skill in terms of warmest admiration. He was an excellent teacher too, and his transference from Anderson's College to the University was as much regretted by the one school as it was hailed by the other. Sir GEORGE MACLEOD won his spurs also in Anderson's College, as already told, and was indeed a noble successor both of Professors BURNS and LAWRIE. He had the great advantage—and it is a great advantage—of comeliness of person; he was above the ordinary height, and his features, essentially Scottish, were at once manly and refined. His manner was exquisitely winning, his claims to distinction modest, his judgment sound, his mode of deliverance, either by pen or speech, free, generous, thoughtful, guileless; yet there was humour in his eye and keen sense of humour in his mind. A letter which lies before us, written but a few weeks prior to his death, carries with it the whole man in all his sweet simplicity and all his strength. It was an answer to a question bearing on art. It opened with a confession of his own inability, but proceeds with his ideas, nevertheless, so plainly and strongly expressed as to carry complete conviction. It showed a strong man who did not realise his own strength. That throughout was the true nature of a man whom to have known in life was a privilege, and whom to remember in death is a privilege also, triumphing over sorrow—the remembrance of a good and great spirit now unconfined, yet ever living in the hearts of those survivors who knew his sterling wisdom, work and worth.

THANKS to the energy and efficiency of Dr. THORNE THORNE and of the other officials of the Local Government Board and of the medical officers of health of our seaport towns, we in this country are in a position to consider the cholera question more or less dispassionately. In consequence of the practical application of principles based on the outcome of scientific observation, we may in Great Britain and Ireland, if not in our Indian dependencies, consider it from the localised or isolated etiological rather than from the epidemiological point of view. Most European countries, indeed, are so far removed from those centres in which cholera is endemic, and the conditions during a great part of the year are so unfavourable to the development of cholera that we should be able, by turning our attention at once to the etiological factor and by carefully studying the conditions of isolated infection, to stamp out cholera before it has the opportunity of laying hold of a sufficiently large number of victims to entitle any outbreak to the serious title of "epidemic."

If the present outbreak on the Continent has afforded evidence of nothing else, it has proved that the ultimate causal agent

of cholera is an organism which is capable of multiplying rapidly under certain definite conditions, but which under other conditions is very readily rendered impotent. Considering this etiological as distinct from the epidemiological factor, our sanitarians have succeeded in dealing with cholera just in proportion as they have, conscientiously or unconscientiously, recognised its importance. KOCH's cholera or "comma" bacillus is said to thrive almost exclusively in the intestine, into the walls of which it seldom passes deeply, and though present in the stools in enormous numbers, especially during the "rice-water" period, it does not make its way into other parts of the body, even when it is thriving most luxuriantly. Under normal conditions of the intestine this organism is so easily destroyed that it may be safely affirmed that unless enormous quantities are introduced by the mouth a perfectly healthy mucous membrane is quite able to deal with it. Where, however, as in the case of intestinal disturbances, as the result of indigestible food, fear, debauchery, or other depressing influences, or, it may be, as the result of the introduction of a quantity of the cholera toxins along with the organism itself, the mucous membrane becomes injured and its functions impaired, the organism is enabled to multiply, to produce its toxins, to cause inflammation of the mucous membrane, through which it is enabled to obtain those products of inflammation on which it seems specially to thrive and from which it is able to produce its toxins in large quantities. It will be objected that it is a simple matter to make such sweeping assertions, but that it is not so easy to bring forward evidence of their accuracy. Let us see what evidence there is in support of this contention. In the first place VIROHOW, who has kept a most open mind on these questions and who has recently been studying the question in Russia, maintains that cholera does not spread through the air and that meteorological conditions have little to do directly with cases of individual infection. He holds that the disease spreads mainly, if not entirely, through the agency of the evacuations of patients already suffering from cholera. If this be so we must be dealing with a substance that is capable of being reproduced at an enormous rate, and, so far as we know at present, there is nothing that can be so reproduced except the living ferment-producing organisms of which the "comma" bacillus is an example. That these "comma" bacilli do multiply at an enormous rate has been demonstrated time after time by numerous observers, whilst it has also been proved that under certain conditions they are capable of producing symptoms in animals which are only comparable with those of cholera in man.

HUEPPE, reporting on the Hamburg water-supply, pointed out that the consumption of the water, which contained a considerable quantity of sewage matter, would under ordinary circumstances be accompanied by no untoward results, but that should typhoid or cholera organisms find their way into this water there would undoubtedly be a most serious outbreak. Typhoid fever in such places as Hamburg may be said to be almost endemic, but cholera only makes its appearance when the specific poison is imported. When it is imported, however, all the conditions necessary for the multiplication of the pathogenic agent are so favourable and the means of conveying it to the inhabitants are so well adapted to the purpose that the spread

of the disease goes on with the utmost regularity and the most appalling fatality. As one of our Special Sanitary Commissioners pointed out last week, the well water in Jumet is contaminated with drainage from the middens, and is thus rendered not only a most favourable nidus for the growth of the cholera organism, but should any of the dejecta from the cholera patients remain unsterilised and be thrown on these middens, access to the wells, especially in rainy weather, is merely the matter of a few hours, and in this way there may occur a regular outbreak around a single case, perhaps imported from a distance. In Antwerp the first patients who were attacked in the present outbreak were those who were engaged in washing the clothes of cholera patients or who helped to unload cholera-stricken vessels, and who had therefore ample opportunities of coming in contact with the cholera-producing poison. Many cholera outbreaks have thus been traced, just as we have been able to trace typhoid fever, from definite centres, and always with the result that the theory of a bactericidal causal agent has been further and further strengthened. Since such agency has been recognised the means of preventing the spread of cholera and similar diseases have been thoroughly systematised by our sanitary officials and are now founded on a practical and satisfactory basis.

Dr. CARTWRIGHT WOOD pointed out some time ago that there was much greater likelihood of successfully combating the cholera organism immediately after it was passed with the dejecta than when it had been allowed to multiply aerobically, seeing that after a time it becomes much more resistant to the action of chemical and other reagents, and, consequently, is in a better position to attack those brought in contact with it. It can under such conditions more readily withstand the acidity of the stomach, and thus has a greater chance of passing into the lower part of the intestinal canal. The excreta of cholera patients, if treated at once with even a weak solution of sulphate of iron, are rendered absolutely inert, the organisms are destroyed, and the toxins formed can do little harm; if, however, even small quantities of dejecta are allowed to remain on damp sheets or body linen, the organism can multiply with such extraordinary rapidity and becomes so far adapted to its new surroundings that it is enabled to flourish on the various foods used by man, and thus, carried on the hands of those who have to wash the linen, distributed by the water in which the linen has been washed, or conveyed by articles of diet, it is widely disseminated. If these facts are borne in mind it is at once seen how utterly illogical and short-sighted are quarantine regulations of all kinds. People in quarantine are extremely liable to take the disease, and thus to form fresh centres; they are depressed and are often badly lodged; they are deprived of sleep, and even of sufficient nutriment to keep up their health and strength; they are not allowed to take exercise; and they are herded together in places not adapted for the reception of large numbers of people. In fact, all the conditions of a Mecca pilgrimage are reproduced on a small scale. The system is radically bad. All those actually attacked with cholera should be immediately isolated, carefully nursed in hospitals or apartments so arranged that thorough disinfection of everything coming in contact with the patient may be carried on; the body linen

should be carefully boiled immediately it is removed, and the dejecta should be mixed with, or passed into, a solution of sulphate of iron, which is probably the very best disinfectant for the purpose. Of course all those who have been or are near cholera patients should also have their physical welfare carefully attended to; they should be watched and compelled to have everything that could have come in contact with cholera patients carefully disinfected. If we could only look upon a cholera patient as covered with and evacuating a deadly green paint, we might have some chance of getting people to realise the importance of isolation and perfect cleanliness and disinfection. We need not fear any great outbreak of cholera in this country during the present year, or even next year, should the admirable precautions that have been taken be persevered with—as no doubt they will be, for no false security is likely to lay hold of our authorities, who now understand so well the idiosyncrasies of cholera. We ought to be, we venture to think, practically safe against any epidemic.

The difference between our system and the quarantine system used abroad has now experienced a severe test, and it is to be hoped that no such disgraceful panic will ever seize us as that which appears to have for a time obliterated all feelings of humanity in our American cousins. The lamentable state of matters that developed and remained in existence for a short time on the other side of the Atlantic indicates only too clearly that, with all our boasted advances in sanitary matters, some of those in authority have still utterly failed to grasp the very elements of sanitation and its relation to the etiology of cholera.

### AMERICAN AND ENGLISH METHODS OF PREVENTING CHOLERA.

“THE quarantine war at Fire Island continues, hitherto happily without bloodshed.” Such is the telegraphic communication with which the cholera intelligence in the public press opened on the 14th inst. Happily, too, for us, the quarantine war in question is going on in the United States of America and not in the United Kingdom of Great Britain and Ireland. It has for many years past been one of the leading contentions of our public health authorities that it was necessary to an efficient sanitary administration that the people should be educated, by the aid of sound sanitary laws and regulations, to such a standard that they themselves would appreciate the importance of maintaining and enforcing those laws and regulations. And we have always contended that teaching a people to rely on quarantine laws had again and again led those very people not to trust in public health measures, but to rely on the stringency of their quarantine laws for their protection. It is also a matter of common report that Governments trusting in such laws have not dared, in the face of the public opinion which they had educated up to the required standard, to do otherwise than enforce their quarantine laws by the aid of the sword, bullet and bayonet, regardless of the cruelties which the system involved. But, notwithstanding all this, we were hardly prepared for the scenes with which American quarantine against cholera has been accompanied at Fire Island within the New York jurisdiction. American sani-

tarians have, we know, contended for a modified quarantine system, and we would not pretend for one moment that a system such as we have adopted for our island, with its incessant communications by sea with neighbouring countries, is one that is adapted, without notification, to distant ports and countries such as those of the western hemisphere. It is for American experts to advise their Government and countrymen as to what are the measures of prevention against cholera which are best adapted, under their own circumstances of public health, commerce &c., to cope with the disease. But we are none the less convinced that the more a nation is educated to rely on quarantine, the more it becomes demoralised from a public health point of view. In the eastern hemisphere the quarantining nations are the backward nations, whose populations have suffered most from preventable diseases, including cholera; and both the folly of their practices and the amount of their preventable disease are largely increased by the extent to which quarantine restrictions have been held up to their people as things to be trusted in. The United States have made vast progress in public health, some of their advisers are men of the highest eminence, and it may be that some system of quarantine is that which will best meet the possible importation and diffusion of cholera in the case of their country. But, however this may be, its educational effect is of the worst. If healthy people are, in the eyes of the Government, such a danger to a community because they come from an infected port, or because cholera has occurred on board the ships in which they travel, that they must be kept away for ten or twenty days, although this may involve the greatest cruelties, indecencies and danger of death, then why complain of the action of people such as those who, in the Fire Island case, armed themselves with clubs, pistols, boat-hooks and rifles, and were deaf to the entreaties, tears and pleadings of helpless women and children, who, though healthy, had been labeled by the quarantine system as dangerous? In this country we have been trying hard to educate the nation to a higher standard—namely, to understand that quarantine cannot be trusted to keep out cholera, but that purity of the water consumed, of the air breathed and of the soil can and do prevent the extension of the disease. But, as we pointed out last week, even some of our sanitary authorities are clamouring for quarantine and are thus trying to lead the public back to experiences which savour rather of the middle ages than of the Victorian era of public health administration. They may plead that Englishmen may be trusted not to behave as did the mob in the Fire Island case. But here, we fear, they are wrong. Prejudice, ignorance and fear have led to almost precisely the same results in our own country, and the moment we revert to quarantine at that moment will there be endless attempts to get ashore in violation of the quarantine regulations rather than remain on board an infected vessel, and with these attempts will come determined and violent efforts to frustrate them; and not only so, but such efforts would have some justification, for they would be in the direction indicated by the Government which had authorised a reversion to the ancient, useless and cruel system known as "quarantine." We would urge people who are thus pressing the Government to read again the intelligence from Fire Island, and also note that the practical outcome of the New York quarantine system is an announcement on the authority of the Board of Health that five cases of genuine Asiatic cholera have already occurred in New York.

#### CIALDINI, SURGEON AND PATRIOT.

AMONG the obituary notices of this most distinguished of Italy's patriot-generals we fail to find adequate reference to the fact that his training was that of a physician and surgeon, and that he graduated in medicine at the University of Paris. The son of a Modenese engineer, he studied "philosophy"

(which corresponds to our arts curriculum) at Parma, and thereafter entered on the medical course at that school. This was interrupted by the revolution in the Romagna in 1831, in which he took the national side, till, after its suppression by Austria, he fled to Paris, where he again threw himself with ardour into medical study. He was a sedulous and devoted pupil of the great surgeons Dupuytren, Lisfranc and Rostan, and in their respective clinics drew in an inspiration and a knowledge that stood him in admirable stead throughout his later and most eventful career. In 1848 he joined the national rising in Lombardy, fought under General Ferrari in the Venetian territory, and, having been promoted to the rank of colonel, took part in the battle of Vicenza, where, severely wounded in the abdomen, he fell into the hands of the Austrians. He recovered consciousness in the wards of a military hospital, and his accurate knowledge of the nature, seat and probable course of his very dangerous wound, and the respect he inspired in his surgical attendants for his suggestions as to treatment, contributed to his rapid and complete recovery. His future achievements in the Crimea, in the campaigns against Austria in 1859, against the Papal and Neapolitan armies in 1860, and against Austria once more in 1866 belong to the history of Europe, and will be amply dealt with in his romantically interesting "Life and Correspondence," shortly to see the light. It is more to our present purpose to draw attention to the fact that of all the liberal professions medicine contributed most to the really effective "makers of united Italy." In the patriotic risings of 1821, 1831, 1848 and 1859-60 there was not a medical school in the Peninsula which did not swell the nationalist forces with contingents more numerous by far than the contemporary schools either of literature or law. In the Parliamentary career, moreover, to which such patriotic service led up, medicine once more came honourably to the front. We need only point to Lanza, the practitioner of Casal-Montferrato, who, once and again Prime Minister, conducted Italy to Rome; or to Bertani, the head of Garibaldi's surgical staff, to whom Italy owes the "Codice Sanitario" now being carried so beneficently into practice, to absolve ourselves from further entrance on a field already amply represented in these columns.

#### MEDICINE AND THE ORIENTALIST CONGRESS.

THE ninth Congress of Orientalists, which has just concluded its sittings, yielded, except in one important department, to none of its predecessors in variety and depth of interest. The keynote struck in the brilliant opening address of Professor Max Müller, its president, was—again we must say with one exception—worthily sustained through all the sections. "The science of language," said the President, "the science of mythology, the science of religion, ay, the science of thought, all have assumed a new aspect, chiefly through the discoveries of Oriental scholars, who have put facts in the place of theories and displayed before us the historical development of the human race as a worthy rival of the natural development of nations displayed before our eyes by the genius and patient industry of Darwin." To this great stream of inductive truth there were many tributaries, represented in the several departments of anthropology, mythology, geography and the cognate sciences, and embodied in papers of original or independent investigation, each containing its element or actual product of fresh knowledge or "working hypothesis." But, strange to say, the science that is perhaps the most ancient of all, coeval and coextensive with mankind—the science that reflects in its successive stages, whether of advance, revolution or retrogression, the contemporary standpoint, moral and intellectual, of the human race—was completely ignored. And yet it could be for no want of subject matter, still debatable or yet to be explored,

that the history of the healing art in the East was practically a sealed book at the Orientalist Congress. Egypt alone teems with problems of medico-historical interest the solution of which must shed the most vivid light on that humanistic development of which Professor Max Müller so eloquently speaks. The Papyrus Ebers has by no means pronounced the last word on Egyptian medicine—on the practitioners of the people of whom Homer said “they are of Pæon’s race and each man of them is a physician.” The healing art of the Indians also literally bristles with unsolved questions, containing in their solution the key to much of the Hindoo civilisation. Take, for instance, the Brahmanic period, with its two great medical authors, Charaka and Susruta. The “Ayur-Veda” (Book of Life) of the latter is still subject matter of the keenest controversy as to its real date. Was it written, as some Sanscrit scholars maintain, many centuries before Christ, or did it first appear, as others contend, between the eighth and ninth centuries of our own era? The explanation of this disparity of estimate may possibly lie in the fact that the book itself contains parts of very various antiquity—the poetic parts being ancient, the prosaic parts, representing later commentary, being comparatively modern. Again, was Indian medicine an indigenous product or was it an importation from without? Is Haas, the latest and not the least competent investigator in this field, entitled to say that Indian medicine is but a derivative from the Greek? Is the same scholar right when he supports his position by referring the name “Susruta” itself to “Bukrat,” which is but a form of “Hippocrates”? Questions these of the deepest interest in themselves, but of interest still deeper in the light their solution would throw on the historical development of Eastern humanity—on that Oriental civilisation, in fact, of which its medical theory and practice were at once the characteristic outcome and the distinctive feature. We have on previous occasions indicated what the world’s knowledge of Chinese medicine owes—still more what it may yet owe—to our medical missionaries. But in this field, as in those of India and Egypt, the sections at the last Orientalist Congress were disappointingly silent. A dip into any history of medicine, from Puccinotti to Haeser and Puschmann, will afford in the poverty of detail, in the wealth of hypothesis as to the healing art of those nations, the proof of how little Oriental scholarship has done for this most interesting section of its subject matter. There was hardly a profession or body of culture, except one, which could not glean something of special, we might say of individual, interest from the proceedings of the late Orientalist Congress. That one was the medical, which has yet, as we have shown, its particular contribution to make—a contribution second in importance to none of those so well and so amply represented in the sections. Let us hope that at their next meeting the Orientalists will have, on the medical side, a better record to show, and that in England at least there are still to be found successors to Prichard, to Turnour and to Wise.

#### ARE MIRACLES UNNATURAL P

SOME time has elapsed since the outside world, inhabited by most of mankind, was stirred by details of the striking cures reported to have occurred at Lourdes. We do not intend, or even desire, to dispute the reality of many if not all such, though we may be allowed to question the veracity of even official reports concerning them. It is, however, we consider, a most unfortunate fact that the minds of so many persons are unable to regard occurrences of this kind as other than subversions of the law of nature. The mere phrase is in itself destructive of all rational ideas on the subject and introduces doubts, difficulties and disunion among the relations of the physical and spiritual worlds which a multitude of other circumstances show to be similar, and

consanguine parts of the same Creator’s handiwork. It implies no discredit to the character of religion and no reduction of their own marvellous reality that miracles should be found capable of natural explanation. The marvel of success remains as great as ever—nay, is enhanced by the wonder of simplicity disclosed in its method, while faith in what was once a mere dogma becomes both purer and stronger when that dogma is shown to be consistent with the rest of the universal order. The “miracles” which in our day attract, not unreasonably, the devout in this and other countries are neither novel nor irregular. Such happen daily in the experience of practitioners. The performance of some has even the shroud of mystery still about it, while it answers to the tests of scientific treatment. Others are more manifest. Still, as of old, “the blind receive their sight, the lame walk, the lepers are cleansed, the deaf hear”—nay, some who to all appearance have trespassed for a brief space within the boundary line of death return to earthly duties, and we know something of “how and why.” Should we, then, regard miracles as opposed to the law of nature, and not rather as facts illustrative of that law, and though once unknown to us never unknowable, and always related in the presiding Mind of the universe with reason, will and order?

#### PTOMAIN POISONING AND SUMMER INDIGESTION.

TOXIC alkaloids as the cause of many cases of accidental poisoning have come into prominence of late years, and every summer instances of ptomaine poisoning are reported. An interesting article on this subject appears in the *Boston Medical and Surgical Journal* of August 4th. Much remains to be discovered relative to the kinds of ptomaines that may develop in both animal and vegetable substances out of the body, as well as of the toxins that may form in food after its ingestion. Doubtless the possibilities of ptomaine formation are very great, and under unusual conditions of insalubrity—hot, damp weather, sewage emanations &c.—the work of decomposition may go on with extraordinary rapidity, and, under the influence of microbes, toxalbumens of great power may form in food that to the eye and taste is still wholesome. There is accumulative evidence to show that this is so. At the same time every investigator of the subject is confronted by the fact that meats that have undergone partial decomposition are not necessarily unwholesome or toxic, for some savage tribes, as the Patagonians and Fiji Islanders, habitually eat putrid meat that is swarming with bacteria. From our present standpoint of enlightenment, as to the development of toxins during processes of putrefaction, we cannot well understand such facts. It must, however, be borne in mind that robust, healthy stomachs are very tolerant of foods which under circumstances of enfeeblement of the digestive tract would cause sickness, that the digestive fluids are more or less destructive to microbes, and that the liver when in a healthy state is capable of destroying considerable quantities of poisonous substances. Cases of poisoning by food of a relatively innocuous character are not uncommon. Some portion of the ingesta becomes an irritant poison, a fit of indigestion ensues, and often the offending substance is speedily expelled by vomiting. The matter of idiosyncrasy need not detain us here; it is known that certain articles of diet, such as cheese and shell-fish, are toxic to some persons. Generally the state of the alimentary canal at the time is responsible. The most common and best known of the various forms of indigestion is that in which, from the absence or the deficiency of gastric juice and other digestive fluids, the alimentary bolus becomes a gastro-intestinal irritant, provoking vomiting, purging and a catarrhal condition of the digestive tract. A second stage in the process of acute indigestion arises from the presence of abnormal fermentations and decompositions in the alimentary canal.

The food substances, under the influence of bacteria unstrained by the antiseptic digestive fluids, break up into organic acids and alkaloidal products of a lower order, which are in part absorbed and produce constitutional disturbances. This stage borders very closely on that of ptomaine formation. There is good reason to regard cholera nostras and the gastro-intestinal catarrh of infants as kinds of ptomaine poisoning due to multiple causes, of which weakening of the alimentary canal and consequent poverty of digestive fluids, the ingestion of food of an indigestible character, the putrefactive decomposition of the latter under the influence of microbes, and the formation of toxins are the principal factors. That a considerable number of persons may simultaneously be attacked with sickness after a large meal owing to the influence of causes such as have been above mentioned cannot be a matter of serious doubt. Similar conditions of faulty hygiene produce, in individuals with similar organic susceptibility, results essentially the same. A remarkable case of this kind occurred in America on July 23rd of this year. Out of a total of seventy persons who dined together, about fifteen became more or less violently ill within a few hours, exhibiting the symptoms of cholera nostras. The general opinion, as advanced by the physicians who had opportunities of studying the facts, is that the sufferers were persons who had eaten rather immoderately of indigestible dishes; that the hot weather, the bad air and bad water of the place coöperated in bringing about the necessary predisposition in the guests, and that therefore what is now known as the "Salisbury sickness" (from the name of the place where the banquet was held) was a local and limited epidemic of cholera nostras.

#### A CASE OF CHARBON.

AN inquest was held at St. Pancras Coroner's Court on Saturday last on the body of an engine-driver employed by some horse slaughterers near King's Cross, who died in the Royal Free Hospital on the previous Wednesday. The source of the disease cannot be traced, for although the man worked at the horse slaughterers', and they deal with all kinds of diseased animals, they are sent from various parts of England and the deceased did not in the course of his employment have to touch any of the animals, having to attend solely to the engine. No other instance of the disease is known to have occurred amongst the other men employed at the establishment for the last year. The history of the case was that on Sept. 4th a small boil formed on the right cheek, which the patient scratched; the next day the boil was somewhat larger, and on the 6th there was a superficial sore, with swelling of the neck, and he felt ill. On the 7th he was admitted to the hospital, under the care of Mr. Battle, with a superficial sore about the size of a florin, surrounded by a ring of minute vesicles. The cheek and right side of the neck were occupied by a large puffy swelling extending from the sore. The temperature was raised (101°), pulse quick, and the man looked ill and had dyspnoea with noisy laryngeal respiration. Coma rapidly supervened, with loud, brassy stertor. Anthrax bacilli were found in the serum taken from the vesicles and the sore was excised, but without benefit. Petechiæ were present along the inner side of the arms, and the glands on the right side of the neck were enlarged and tender. He died at 1 o'clock next morning. At the post-mortem examination made by Mr. Farmer the usual appearances noted in patients who have died from anthrax were found; but in addition it was observed that extensive general hæmorrhage had taken place in the meninges of the brain, and over the left occipital lobe was a clot, about the size of a walnut, compressing the convolutions. There was a small amount of clotted blood also in the lateral ventricles and in the fourth ventricle. The sore presented no central dark slough, and

there was no surrounding redness. In these points and in its rapid course the case resembled the condition described as "malignant œdema," a variety not common in this country.

#### CURIOSITIES OF TINNED FRUITS.

A CORRESPONDENT has submitted to us for examination a living creature which he states was obtained from the inside of a tinned pineapple. The fruit had been boiled at Singapore previously to tinning it and was then imported to this country. On the tin being opened our correspondent was somewhat surprised to find a living insect, of strange and unknown appearance, inhabiting the inside of the pineapple. On examining the insect we found it to be the larva of some beetle the species of which could not be accurately ascertained; consequently it was impossible to say with certainty whether its natural food was vegetable or animal material. It is quite possible, however, that the statement of our correspondent regarding the cooking of the pineapple may be correct; for the fruit might have been imperfectly or incompletely cooked. In that case the temperature of the interior might never have reached so high a degree as to cause coagulation of the living tissues or of the structure of the egg or larva. The power of many insects and mites to resist both high temperatures and the action of many poisons is well known and exceedingly remarkable. Thus the seed of the nux vomica, deadly to most animals, forms the appropriate food of certain beetles. Goats, again, are well known to have no special aversion to hyoscyamus as an article of diet. There is of course always the possibility of error of observation and of the introduction of the insect after the fruit has undergone the process of preservation.

#### ACUTE INFECTIOUS EPIPHYSITIS.

UNDER this heading Drs. W. M. Coplin and D. Bevan of Philadelphia contribute a paper to the *Medical News* of Aug. 13th. They define acute infectious epiphysitis as a disease peculiar to infancy and adolescence, and due to the specific pathogenic action of one or more of the microbes of suppuration. It is a disease the etiology of which modern bacteriological research has revealed, and which for more than a century and a half has baffled the most diligent inquiry of able scientific observers. The specific cause of this condition is not a special organism, as Becker at one time supposed, but as determined by Krause, Garré and Rosenbach, whose researches and observations have been substantiated by many of the more able bacteriologists of the day, this disease is produced by one or more of the varieties of pyogenic microbes, the entrance of which into the circulation is usually effected through some abrasion of the skin, or less frequently through the mucous membrane of the respiratory or alimentary tracts. The organisms have apparently a predilection for the long bones, and more frequently attack the one extremity, that from which the development of the bone is principally accomplished—e.g., the lower epiphysis of the femur and the upper epiphysis of the tibia. The short and flat bones are not exempt from the process; that they are not frequently involved may be ascribed to the fact that their position and function render them less liable to injury, and that the evolving changes in their development are not of such an active character as is observed in the long bones. The relative affinity of the microbes for one or other extremity of a bone, or for any particular class of bones, is not incomprehensible when the anatomic structures are studied. In the medullary tissue, in proximity to the epiphysial cartilage, where the transitional changes in the vascular supply attain their maximum, or where the blood pressure and velocity are at a minimum, where the capillaries are mere excavations, or have but an imperfectly developed wall, all the conditions are found most favourable for

the localisation and multiplication of micro-organisms, the pathogenic action of which is in health counteracted by the internal resistance of the cells. According to Mr. Howard Marsh there are three situations that furnish a ready nidus for the localisation of microbes: immediately subjacent to the cartilaginous disc; in the vicinity of the ossifying centre; in the line of union between the epiphysis and diaphysis. There is at first an increased supply of nutrition, quickly followed by a rapid multiplication of the nuclei of the fixed cells. These cells surround themselves with a layer of granular material, and the whole is encased within a shell of earthy matter. A poor and lowly organised form of bone is thus produced. This is the analogue of the granulation tissue found in other structures of the body. The compact portion of the bone does not escape, for it is found that the laminae corpuscles undergo a granular degeneration, and the bone dependent upon the corpuscles for nutrition and repair degenerates. The authors of the paper then describe an illustrative case. Amputation seems to be the only treatment.

#### TAILORS AND INFECTIOUS DISEASE.

MUCH excitement has been caused by a statement made on Saturday by Miss Frances Hicks, a London tailoress, at the meeting of the Trades Union Congress at Glasgow, that only about two months ago she was making trousers for the Duke of York when two children were taken out of the next house and sent to the fever hospital, and that it was quite possible that the trousers referred to were made in the very room where the children had been, as it was rented by a widow who was a tailoress. We gather from the published accounts of inquiries made by the representative of a London newspaper that this circumstance had not actually taken place, and that there is, therefore, no reason to regard this statement as indicating more than the possibilities which may attach to the making of clothes generally. Charles Kingsley has told in "Alton Locke" the story of the dangers which attend the wealthy classes from their clothes being made by poor persons who have continued their work whilst in close contact with a case of infectious disease. Our own columns have contained accounts of occurrences of like kind, and we are at this moment reminded of a case which came under our observation of a working tailor who attended his wife suffering from small-pox in a room adjoining that in which he was engaged in making clothes. Such circumstances must necessarily happen from time to time when clothes are taken to the homes of the workers. The question which arises is whether the risks of this custom of the trade are such as to constitute so serious a danger to the public health as to render it necessary that no clothes should be made away from the premises of the master tailor. No doubt many cases of infectious disease occur of which the cause remains unknown; and it may be that disease is exceptionally communicated under the circumstances we have described; but it is impossible by any legislation to interfere with home work; and if the possibility we have indicated is to be guarded against, it must be by the employers providing proper workshops in which the clothes may be made without this chance exposure to infection. It may serve the interests of persons who are well-to-do to pay a sufficient price for their clothes to enable the master tailor to provide the means of guarding them against this risk. For the rest the general public health law must be relied upon: the notification of cases of infectious disease, the early removal of the sick to hospital, and the disinfection of the rooms they occupy, together with the contents of their dwellings. Master tailors may, however, do much in following the example of many mill vendors in requiring their workpeople to give them notice of cases of infectious disease occurring in their homes and in undertaking to make them an allowance when any of their

family suffer from infectious disease, and until the sick person has been removed to hospital and the room and its contents have been disinfected. But whatever is done, there should be no encouragement given to poor persons to retain in their own homes the infectious sick who cannot be properly isolated. This, indeed, is the only real safeguard, and any provision which militates against these precautions should be avoided. If Miss Hicks's statement should have awakened any special interest as to the dangers to which the community is exposed from infectious disease occurring among its poorer members, we would desire to point out the importance of obtaining better knowledge of the circumstances in which infectious disease has its origin. The prevention of the spread of infectious disease is undoubtedly important, but the prevention of the beginning of infectious disease is that which is most needed. During the last few years our knowledge of the origin of diseases of this class has been largely added to, particularly by the observations of Mr. W. H. Power in respect of scarlet fever and diphtheria. But work which has had so successful a beginning cannot be prosecuted without larger aid than Government departments have yet thought fit to give to this useful branch of inquiry.

#### THE SANITARY CONDITION OF HASLEMERE.

IT is now some two years since we referred to this subject and it would seem that practically nothing has been done to remedy the serious defects which we then pointed out. The subject has apparently not been altogether lost sight of, as the inhabitants have from time to time made some small efforts to obtain the needful improvement; but, if we may judge from the reports in the local press, it would seem that the responsibility for the delay rests rather with the rural sanitary authority and the parochial committee than with the inhabitants themselves. We observe from the *Surrey Advertiser and County Times* of the 3rd inst. that the Hon. Rollo Russell, in a letter addressed to the sanitary authority, refers to a report by the county medical officer (Dr. Edward Seaton) published a year ago, dealing with the serious condition of things at Haslemere, and urges that that report should be considered by the sanitary authority without further delay. Another resident, Mr. Rayner Storr, has written enclosing a petition signed by thirty-nine inhabitants, drawing the attention of the rural sanitary authority to "the prevalence of noxious smells and nuisances in Haslemere." Surely it is difficult for the rural sanitary authority to escape blame for allowing so long a period to elapse before dealing with the evidently unwholesome state of the town. It is high time that efficient systems of water-supply and of sewerage should be provided.

#### TRAINED STEWARDESSES.

IT was for several reasons a happy thought which recently suggested the selection of women who had enjoyed some training as nurses to act as stewardesses on shipboard. The arrangement is certainly a promising one as far as passengers are concerned, and its success would indirectly requite ship-owners also. In the frequent event of illness a stewardess who understood nursing would find ample opportunity of proving her double efficiency. This does not of course imply that she should devote herself, even for the time being, to nursing duties, but there are numerous trifling but valued attentions, many niceties in diet and the like, which invalids now sigh for in vain, which might easily be provided at her suggestion. Faults in cleanliness or general sanitation would be more liable to detection and amendment. Thus in many ways the capacity derived from her acquaintance with diverse but compatible occupations would enhance her usefulness. Another point must not be overlooked. The position of such a trained stewardess would carry with it no duty and no power of

independent action. Her place in the ship would still be simply that of a stewardess. Her wisdom and her success would consist in her understanding this. She could not expect to pose as a reformer. Insight blended with tact, and working by judicious and timely suggestion, would alone serve her in any purpose of this kind. No other course would or could be tolerated, for order and obedience come before all other considerations in the management of every well-regulated vessel. While we are discussing this subject, chiefly in view of the nursing capabilities of women, we do not forget that the male agents who share with them the duties of the marine commissariat are also capable of discharging similar nursing duties with success, if allowed the same advantages of instruction. Here is an opportunity for ambulance committees.

#### "LA FRANCE, LA PLUS HEUREUSE DES NATIONS."

A FRENCHMAN is nothing if not patriotic, and it would be surprising indeed if the feminine portion of the *grande nation* were lacking in this truly national characteristic. Against the cultivation of a quality so estimable we have nothing to say, but a protest is only natural when we find it becomes a cause of unjustified self-laudation. This trait is, were the occasion worthy, most natural and hardly repressible when alien but equally deserving interests are sacrificed at the national shrine. These observations are suggested by a curious passage lately published in a French contemporary, in which "*la plus heureuse des nations*" is congratulated on possessing a lower death-rate, a lower percentage of illegitimacy (!), a greater number of robust adults, and other happy circumstances which place her in front of all other civilised peoples. Figures are given, but their compilation, if the following may be taken as representative, must have been chiefly arbitrary. As regards death-rate, we find it gravely stated that in England this is 31 per 1000, in France 23. This looks well for the national future of our nearest neighbour. If, however, we examine the Registrar's reports for this island during the last decennium (1881-89) we find that the rate was 20. May the happiness of the "most happy nation" be more firmly assured than the assertions of her too patriotic statistician.

#### THE STAMPING OUT OF GLANDERS.

THERE is at last some evidence that steps will be taken to deal with glanders in a more enlightened and efficient manner than has hitherto been the case, and that what was becoming something of a scandal will no longer be tolerated. It has required a good deal of urging and agitation to rouse the authorities to a sense of their duty; but better late than never. There should be no great difficulty in combating the disease, even without compensation; indeed, it should be to the interest of horse owners to have it extinguished without being bribed to report the existence of the disorder in their stables. Nothing is more liable to abuse than this system of compensating owners for the destruction of horses suffering from an incurable contagious disease; it is fair and proper to pay them for those which are not affected, but which may have been killed because of glanders being suspected in them, but to compensate them for those animals which are visibly and unmistakably glandered is unjust to the taxpayer and very likely to lead to fraud and neglect. It is to be hoped that we shall hear no more of glanders and farcy being treated as different infections; for the latter form is quite as dangerous, if not more so than the former, and should be as energetically dealt with. It has been stated that the incubation and course of glanders are protracted, but this is not so in all cases. The period of incubation is most frequently brief, and not seldom the malady runs a rapid course; hence there are acute and chronic glanders, the first being nearly always observed in the ass, though it is also often witnessed in the horse. With the

discovery of the valuable properties of mallein there should not now be any hesitation in establishing a diagnosis in what were formerly considered to be doubtful cases, as the subcutaneous injection of this substance will prove the existence of the disorder in a horse which may otherwise exhibit no signs of it. Even without this reagent farcy is easily enough diagnosed, as its indications are manifested on the exterior of the body; it is only in the internal form of the disease that doubt has sometimes been felt; but by the employment of mallein this should no longer be experienced. It is to be hoped that in devising rational measures for the suppression of glanders among our own horses care will be taken that it is not introduced by those which are imported in such large numbers; for the fact must not be overlooked that the scourge prevails in every European country, in Egypt, America, South Africa and India. By a system of rigid inspection it has not been allowed to enter Australia, New Zealand or Tasmania; but in England, so long as horses are permitted to come from infected regions, we shall always be liable to its introduction unless the greatest care be exercised.

#### THE HOUSING OF THE WORKING CLASSES ACT.

SOME time ago the vestry of Chelsea instituted proceedings under the Housing of the Working Classes Act for the closing of certain houses in Chelsea, and the leaseholder, having less than twenty-one years' interest, was unable to be a party to the proceedings. Fresh summonses, it appears from a report in the newspapers, were issued with a view to enabling him to see that the work ordered was carried out; but the magistrate refused to hear his evidence, and a Divisional Court subsequently granted a rule *nisi* calling upon the magistrate to state a case. The vestry subsequently made an order for the demolition of the houses, and had begun to carry out this order when the leaseholder applied for an *interim* injunction to restrain the vestry from demolishing the houses before the rule *nisi* had been argued. Mr. Justice Bruce, however, dismissed the application with costs, and the vestry will now doubtless proceed to rid their district of these houses. The plaintiff had entered an appeal at Clerkenwell against the demolition order of the vestry, but had abandoned it owing to the fact that he was not an owner within the meaning of the Act. The position of the leaseholder when he has less than twenty-one years' interest is doubtless anomalous, but it must be recollected that the maintenance of houses falls upon the leaseholder, and it is only exceptionally that a demolition order would be made when the premises are in proper structural repair. The leaseholder is therefore usually in fault in cases where demolition orders are made. In the report of the proceedings which we have before us, and which may not be altogether accurate, there is nothing to show whether the leaseholder effected improvements after the magistrate first granted a closing order. A precise report of these proceedings would be useful alike to sanitary authorities and the owners of houses.

#### FEVER PREVALENCE IN LONDON.

THE resources of the Asylums Board are now being taxed to their utmost to keep pace with the steadily continued prevalence of fever, chiefly scarlet fever, in London. On the 12th of this month, the large total of 100 patients were removed to hospital. At the present moment about 3700 patients are under treatment, of whom 3300 are suffering from scarlet fever. From the "Monthly Analysis of Sickness and Mortality Statistics in London" for August, which we print in another column, it is seen that although most of the cases of scarlet fever were notified from Islington, Poplar and Lambeth, yet, in proportion to population, the rate of prevalence was greatest in Holborn of the central districts, Newington, Bermondsey and Plumstead of

the south districts, and Whitechapel, St. George's in the East, Limehouse, Mile-end Old Town, and Poplar of the east districts. The east end of the metropolis appears, therefore, to be the especial seat of the present prevalence of scarlet fever, and Poplar appears pre-eminent amongst these, though its scarlet fever attack-rate is below that of Holborn. These facts call, we think, for some inquiry by the Local Government Board or the London County Council. In the meantime, we learn that efforts are being made to press on the temporary North-Eastern Hospital at Tottenham. The site of this consists of seventeen acres, and the accommodation will comprise room for 440 patients and 250 staff. The wards will be so constructed as to afford 144 square feet of superficial space to each patient; and it is anticipated that they will be ready for patients in about three weeks' time. Meanwhile the usual autumnal exacerbation of scarlet fever will take place, and the hospital managers will have enough to do to keep pace with the requirements that will be forced upon them. It is gratifying to see that the extra work thus entailed upon the managers has not prevented their cholera committee proceeding with the active and important work of maturing efficient plans of ambulance transit and hospital isolation, in the event of cholera appearing in London this year or next.

#### CHILDREN'S TEETH.

THE statistics brought forward by Messrs. David Fisher and George Cunningham (who have so long been identified with the "cause" of children's teeth), and which have repeatedly been the subject of papers read at the British Dental Association and other societies, are further supplemented by a report by Mr. Denison Pedley. This report is derived from a systematic examination of 1985 children at the Sutton district schools. Though not so black as some, yet it shows an enormous amount of disease, for out of this number only 527 are recorded as having sound dentition. Mr. Pedley makes some pertinent remarks. The temporary teeth, he says, are popularly thought not to be deserving of any particular attention, whereas much misery and detriment to health may be avoided by judicious treatment. Between the ages of six and twelve there were, according to the table, 758 permanent teeth that could and should have been saved, 201 hopeless and 121 which had already been extracted, most of these being the six-year-old molar, a tooth so often mistaken by parents for one of the temporary set. He suggests that all public schools should have a paid dental surgeon, who should periodically examine all the children and perform any operations—conservative or radical—that are considered to be desirable, and, moreover, that a record should be kept. These views are entirely in accordance with our own, and, we are glad to say, are gaining ground generally, as exemplified by the recent sanction of the Local Government Board to the appointment of a dental surgeon to the Central London district. The records of so large a number of cases as would come under observation in such an appointment, if carefully kept, could not fail to be of scientific value.

#### REARRANGEMENT OF THE CORONERS' DISTRICTS OF LONDON, MIDDLESEX, SURREY AND KENT.

THE *London Gazette* of the 8th inst. published the new coroners' districts as arranged by Order in Council on that date. The county of London is divided into eight districts—viz., the Eastern, North-Eastern, Central, Western, Penge, Southern, South-Western and South-Eastern. The county of Middlesex is divided into three districts, named respectively the Eastern, the Central and the Western. The county of Surrey is divided into three districts—the Kingston, the Reigate and the Guildford. Lastly, the county of Kent is divided into six districts. These are the Cranbrook, Greenwich, New Romney, Sittingbourne, Ashford and Tonbridge. Mr.

Luxmore Drew, M.B., barrister-at-law, has been selected by the London County Council for the vacant office in the south-western district. This, while reflecting great credit upon the Council, is only what might have been expected. The arguments in favour of electing a candidate who has had a medical training are overwhelming and do not admit of argument. Dr. Drew possesses also the legal qualification which will satisfy those who are opposed to the medical coroner pure and simple. It is very important that the exact boundaries of all these districts should be carefully studied by all those whose duties render a knowledge of them necessary or even desirable. At the present time a difficulty has arisen as to which is the proper coroner to hold an inquest on the body of a man who died from an injury in Knutsford-road, Latchford, a suburb of Warrington. Mr. Yates, the Cheshire coroner, and Mr. Bingham, the coroner for the West Derby division of Lancashire, have each decided that the death did not occur in either of their districts, and the matter remains in dispute. Similar occurrences may happen if the boundaries of any newly created districts are not carefully studied.

#### WORKHOUSE INEFFICIENCY.

ANY person possessed of ordinary humanity will admit the force of reason which, a few days ago, led one of the metropolitan magistrates to condemn in the strongest terms an abuse in our system of casual relief. In this case a man who had already walked some twenty miles arrived at the workhouse in Chelsea. Here he could not be received for want of a casual ward, but was directed to go some three miles further—to Notting-hill. Driven by fatigue and desperation to an act of petty violence, he was sentenced to a short term of imprisonment, from which, however, he was happily released when the provocation to which he was subjected was made known. It is hardly to be wondered at that the practical inefficiency of the workhouse in Chelsea was described by the magistrate presiding in this case as monstrous in its negligence. The casual ward is clearly an essential portion of the parochial system in which it exists. Its absence might at any time entail upon an applicant for charitable shelter not only fatigue in seeking a more distant lodging, but possibly injurious exposure with consequent illness. It is therefore to be expected that steps will be taken as early as possible by the Chelsea Board to make good so grave a defect in their workhouse arrangements.

#### ARTISANS' DWELLINGS.

A STATEMENT in a recent report by Mr. A. Wynter Blyth, the medical officer of health of Marylebone, in reference to the administration of the Customs and Inland Revenue Act of 1891, is well deserving of consideration by those who will have the framing of the London Building Bill which, it is hoped, will be introduced into Parliament during next session. It will be recollected that owners of artisans' dwellings can claim exemption from inhabited house duty if they can produce the certificate of the medical officer of health that such houses are properly constructed. Mr. Blyth submitted a long list of premises where sanitary improvements had to be effected before he could give the requisite certificate, and he stated that "from this list it will be gathered that it is quite exceptional for a block of artisans' dwellings of even recent construction to be in a tolerable sanitary condition. The reason for this anomalous state of things is that during the building of these dwellings the sanitary authority seems to have no power; a dwelling must be occupied before it comes under supervision." The London Building Acts are indeed so faulty that they permit houses to be erected for which in particular instances closing orders have been obtained shortly afterwards under the Housing of the Working Classes Act. Under circumstances where this can occur we can well

believe that many, which cannot be thus dealt with, still fall short of the higher condition of excellence which is contemplated by the Customs and Inland Revenue Act. The remedy undoubtedly is to amend the Building Acts; but even when this done it is still desirable that the planning and arrangement should be subject to the approval of the local authority, for no Act can be so drawn as to cover all the conditions which ought to be held necessary. Some more intimate relation between the administration of the London County Council and the local sanitary authority appears to be indicated, but it is not obvious how this can be brought about until these authorities are more closely associated by an Act for the better government of London.

#### THE PUBLIC HEALTH OF ITALY.

AN Italian correspondent writes:—"According to official information furnished by the Ministro dell' Interno, the health of the peninsula is excellent, all the sanitary bureaux in the islands, as well as on the mainland, having just telegraphed to headquarters in the same satisfactory sense. The so-called case of cholera announced from the island of Capri, in the Bay of Naples, turns out to have been greatly misreported. It was simply a case of ordinary diarrhoea, rather violent in character. Meanwhile the sanitary surveillance on the northern frontier is maintained with unabated vigilance. The 'Direttore della Sanità Pubblica,' who, as already announced, had gone to the Swiss confines to inspect the sanitary 'servizio di vigilanza,' has just sent back a most reassuring report. Besides the measures for disinfection and isolation ready in case of need to be enforced on the Italian side, the coöperation of the Swiss authorities in keeping the Government of Italy informed as to the first indications of cholera or other infectious disease within their frontier is at once cordial and effective. Both powers, Italian and Swiss, are mutually pledged to the adoption of the most rigorous ulterior measures should the sanitary situation prescribe them."

#### PERSONAL LIBERTY AND SANITARY LEGISLATION.

WE are only at the beginning of the question of the limitations of personal liberty for the good of society. It is raised in a somewhat acute form in such Acts as the Vaccination Act, the Notification of Infectious Diseases Act and the Public Health Act. Under the last Act especially strong human feelings have to be contended with and great tact and judgment are needed in those who execute the law. The law nevertheless is a good and reasonable one. We read in the *Western Daily Mercury* that recently great difficulty was experienced at Devonport in carrying out a magistrate's order for the removal of a child with scarlet fever to an infectious hospital. The mother locked the door and the neighbours sympathised with her. The first resistance succeeded; but at length the key was found and the child was removed in the interest of the public, and especially of the child's own family and of the neighbours who were the resisting parties. At St. Ives a public meeting has been held to oppose the introduction of the Notification of Infectious Diseases Act on the view that it is the first step to isolation of infectious cases. The administration of the law should be carried out with mingled firmness and sympathy.

#### "A BRITISH HOSPITAL FOR HYDROPHOBIA."

THE mental attitude characteristic of the opponents of vivisection is, we fear, too immovably fixed in sentiment and averse to reason to allow of its being altered by rational discussion. We are not therefore surprised that in spite of the signal triumphs of humanity won for mankind by this method alone, and in nothing illustrated more distinctly than in the preventive treatment of hydrophobia, the position of these

objectors remains unchanged. They cavil as we suggested in our last issue, at the needful suffering inflicted on a few rodents with this purpose, and in arguments of the most fallacious character seek to load it with responsibility for numberless alien operations. What, in fact, does the suffering endured in preparing the virus of rabies really amount to? We may best answer this question by reference to a paper by Dr. W. N. Thursfield in the *Sanitary Record* of Dec. 15th, 1887, in which it is stated that the only processes absolutely essential to the practical working of the Pasteur system consisted in: (1) the inoculation of three rabbits daily with rabid virus; (2) test inoculations chiefly on guinea-pigs to test whether animals presumably rabid were really so. (The latter we should consider much less essential than the former and probably not always indispensable.) Further, all inoculations except those which were merely subcutaneous (and such are daily employed in the ordinary treatment of disease) were performed under anaesthetics. The rabbits operated on acquired the paralytic form of rabies, with dulness of cerebral function and apparently did not suffer much pain. Surely no thinking person would compare this greatly limited discomfort in animals, hardly to be called suffering, with the irrepensible agonies of hydrophobia in man. What, then, becomes of even the sentimental opposition to a British institute for the treatment of hydrophobia?

#### THE SPLEEN A NECESSARY FACTOR IN IMMUNITY.

DRS. PIZZONI and PATTANI have found that the spleen exerts a very important influence in processes adopted with the object of rendering animals immune to infectious diseases. Their experiments were conducted with the virus of tetanus upon guinea-pigs, and they found—as, indeed, they had been led to expect by previous researches on the blood serum of animals rendered immune—that those in which the spleen had been extirpated were incapable of being rendered immune, this incapacity being permanent. It would thus appear that no other organ is able to carry on the particular function of the spleen upon which the immunity depends, though its hæmatopoietic functions may, as is well known, be vicariously performed by the medulla of the bones.

#### RESPONSIBILITY IN HOMICIDE.

SINCE the time—now long forgotten in antiquity—when public opinion first began to busy itself with the duties of the physician no subject has probably supplied it with a deeper interest than that of destructive madness. Our ancestors unwrapped it from the dark shroud of demon-possession and showed it forth as a form of lunacy. We, more wisely vague, have clothed it with another shadow and called it homicidal mania. Still we seek more light and still we do not know the limit, if there be one, which excludes it from crime and includes it within the province of disease. For a ray of light which may help our decision in this matter, and thus prove of practical value, we are indebted to Dr. Ellis of Singapore. The experience of this observer as medical superintendent of the lunatic asylum in that town has brought him in contact with Malays affected with the disease known as "amok" or "amuok." The result of his investigations is that he divides those evidently suffering from this disorder into two classes. These are: (1) Persons in whom the sudden maniacal fury is obviously and unaccountably impulsive, uncontrollable and unexplained by previous ill-temper; and (2) those who, under a sense of wrong, have worked themselves into a fury which results in the ungovernable impulse referred to. The latter he naturally considers at least partially responsible, the former not at all. Researches into causation have yielded no very tangible result, and the classification above given brings us no nearer to the causal fountain head than we were before. It is so far

practically useful, however, since it lays down as the only possible basis of judicial condemnation a previous and conscious neglect of self-control. Unfortunately we are still confronted by the problem suggested by a later "uncontrollable" impulse. The real significance of this could only be justly estimated on additional proof of the existence or absence of a like sense of responsibility. This forms the core of the question. It should be clearly understood, however, that badness is not madness in any legal sense, and that even great and wilful wickedness is consistent with sanity.

#### VARICELLA AND HERPES.

PROFESSOR JOHANN BÓKAI, superintendent of the Children's Hospital at Buda-Pest, publishes in a Hungarian medical journal several cases of varicella which had occurred in his practice under rather peculiar circumstances. The first of these cases had been observed in the year 1888, when a child was attacked by chicken-pox. Ten days afterwards another child in the same family had exhibited all the symptoms of herpes zoster. Professor Bókai saw a similar case in 1891. A woman suffered from herpes zoster, and twelve days after its appearance, her child of eight years had chicken-pox. A second case occurred in the same year. He diagnosed herpes frontalis in a young man, and fifteen days later chicken-pox in his sister, a little girl of thirteen. Professor Bókai communicated his observations to Professor Korányi and the latter very soon reported a similar observation. He had then in his ward a patient suffering from herpes of the thigh, and eight days after his admission a patient in the same ward, who had a splenic tumour, contracted chicken-pox. The suggestion is offered that an attack of chicken-pox, instead of exhibiting general eruption, may under certain circumstances have the latter so circumscribed as to form the ring peculiar to herpes zoster. Professor Bókai considers this explanation the more likely, as latterly epidemics of herpes have been observed, especially by Kaposi. Certain forms of this disease have been known to be highly contagious.

#### DEATH FROM HYDROPHOBIA.

THE death from hydrophobia of H. L—, a lad seventeen years old, a joiner, calls for something more than passing notice. On Aug. 1st, 1887, his brother (a young man aged twenty-six), and J. W. W— were all bitten by a mad fox-terrier dog. The two brothers and W— went to Paris four days after they had been bitten and were submitted to the anti-rabic treatment in the Pasteur Institute for about fourteen days. On their return to this country the elder brother succumbed to an attack of hydrophobia nine weeks after he was bitten, whilst the other two patients continued apparently in good health. The younger lad stated that he had no fear of hydrophobia, and for five years he had no symptoms of anything of the kind. On Sept. 1st, however, he began to complain of pains in his neck, arms and back; when he attempted to drink he was seized with spasms, which became more marked until the 4th; he then became very nervous; he had to be held down in bed, and chloroform was administered; he foamed at the mouth, called out, was convulsed, and ultimately he died exhibiting all the symptoms of hydrophobia, a diagnosis that was said to be confirmed by post-mortem examination. The period of incubation in this case is a most extraordinary feature. Hitherto the longest period at which an attack of hydrophobia has supervened after a bite is said to be about two years and a half, and it is very remarkable that if this was a case of true hydrophobia the appearance of the first symptoms should have been at such a late period after the bite. It seems that the patient had suffered from blood-poisoning a short time ago, and from the nature of his employment the possibility of this being an attack of traumatic tetanus must not be over-

looked. It is certainly a matter that should be carefully inquired into. The symptoms and post-mortem appearances are so much alike in the two conditions that a mistake in diagnosis may possibly have been made.

#### SMALL-POX.

ONLY some twenty cases of small-pox per week are reported throughout the country. The north still continues to furnish most of them, Warrington and Halifax being the places at which the greater part have occurred.

#### FOREIGN UNIVERSITY INTELLIGENCE.

*Havana.*—Dr. Gabriel Casuso has been appointed to the chair of Midwifery and Gynæcology.

*Innsbruck.*—Dr. P. Dittrich of Vienna has been appointed Extraordinary Professor of Forensic Medicine.

*Jena.*—Dr. Adolf Witzel of Essen has been recognised as *privat docent* in Odontology.

*Paris.*—Professor Verneuil, the well-known surgeon of the Hôtel Dieu, who is sixty-eight years of age, is about to retire. He was one of the first in France to recognise the importance of antiseptic surgery. It is expected that Professor Lefort of the *Pitié* will be appointed in his place.

#### DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Dr. Karl Ritter von Cessner, Emeritus Professor of *Akhirgjo*—i.e., surgical appliances—at Baden, in Vienna, at the age of seventy-five. He was vice-president of the Austrian Red Cross Society, in the work of which he took very great interest.—Dr. Nérouzous Bey, formerly President of the International Sanitary Council of Egypt.—Dr. Antonio Maria Barbosa, Emeritus Professor of Operative Medicine in the Lisbon School of Medicine.

ON Friday night, Sept. 1st, at the Sunderland Infirmary, Dr. James Murphy performed abdominal section on a girl aged seventeen for a perforating ulcer of the anterior wall of the stomach. He pared the edges of the ulcer and closed it with two rows of sutures; he then washed out the abdomen and closed the wound. The perforation had occurred thirteen hours before operation, and the contents of the stomach had escaped into the abdomen. Up to Wednesday, the 14th inst., the patient's condition left nothing to be desired.

IT is very satisfactory to perceive the attention that is being directed all over the country, by bodies concerned with the administration of public health laws, to the condition of water-supplies. No more hopeful sign of the march of intelligence in this direction can be afforded than the wide interest that is being taken in this important question.

THE Sanitary Committee of the Glamorgan County Council has decided to promote the appointment of a medical officer of health for the county, at a salary, inclusive, of £1250.

THE number of patients in the several fever hospitals of the Metropolitan Asylums Board at midnight on Sept 13th was as follows:—Eastern Hospital: scarlet fever, 414; diphtheria, 69, and enteric fever, 33. North Western Hospital: scarlet fever, 393; diphtheria, 81 and enteric fever, 24. Western Hospital: scarlet fever, 304; diphtheria, 44; typhus fever, 3 and enteric fever, 10. South Western Hospital: scarlet fever, 316; diphtheria, 61, and enteric fever, 21. South Eastern Hospital: scarlet fever, 400; diphtheria, 24; typhus fever, 1 and enteric fever, 7. Northern Hospital: scarlet fever, 774 and diphtheria 20. Gore Farm Hospital: scarlet fever, 730. In the Hospital Ship Atlas there were 4 cases of small-pox.

## CHOLERA.

### PROGRESS OF THE CHOLERA.

THE latest returns show a sustained decline of cholera in Hamburg, where it is officially reported that up to Sept. 10th there had been 13,238 cases, or an attack-rate of 20·7 during the period of the epidemic, and 5,805 deaths, or a case mortality of 43·8 per cent. As far as is known, the disease has acquired no foothold in Berlin or other cities of North Germany. At the same time, active measures of medical and hygienic administration are about to be carried out in the whole of the Elbe basin. And so far there has been no appearance in Vienna or the Austro-Hungarian empire, where a considerable pecuniary outlay is being effected in organising measures to combat the disease should it appear. Cholera is of course still raging in Russia, but evidences of its diminution both in quantity and intensity, particularly at St. Petersburg, are forthcoming. As regards France, a distinct and definite prevalence, hardly amounting to an epidemic, is apparent in Paris, where it is reported that the quarter of La Villette is undergoing a smart attack of fatal enteric fever. This is not reassuring, and may point to an epidemic extension of what true cholera there may be in Paris, or to its probable development from vague cases of choleric, choleraic diarrhoea and variously termed bowel complaints which obtain there at present. It is also reported that the disease still prevails at Havre, which remains a distinct danger to us. News from the Hague, too, does not tend to allay apprehension in this country, for there are reports of fresh cases at Rotterdam and other places in Holland. As regards actual importation into this country, it is satisfactory that none has occurred, though two vessels have arrived, one at Barry, near Cardiff, from Hamburg, and the other at Hull from Cronstadt, having had on their way deaths on board from cholera. They have been medically inspected and overhauled, and are being detained under observation. If anything additional were required to impress upon people's minds the inutility and barbarousness of quarantine, it would be the side-light thrown upon that system by the scenes lately enacted off Fire Island, outside New York. The selfishness and inhumanity shown to the belated passengers of the *Normannia* by the inhabitants of that island is but the natural corollary of a procedure which, by its detention of the healthy and unaffected in close confinement near the sick, breeds disease and engenders panic and suffering.

### THE REAL SAFEGUARDS.

The literature connected with the present prevalence of epidemic cholera in Europe and its transmission from infected places abroad to this country and across the Atlantic to the United States is fast becoming so extensive that it is difficult, if not impossible, to keep pace with it. In our previous articles we have attempted to give a *précis* of the facts connected with its current history and progress. We have also endeavoured to inculcate certain precepts and practice in regard to cholera, and to state what we know and what we still require to know about it from two different aspects—viz., as a pandemic or branch of epidemiology, on the one hand, by surveying the facts connected with its extension on a large scale, over vast tracts of country and amid different populations; and, on the other, as to its spread on a small and limited scale, by studying its progressive steps in a circumscribed community made up of individuals. In order that our remarks should not lack a practical aim we have striven at the same time to indicate such firm footholds of fact as appeared to be warranted by our past experience and present knowledge. We repeat that the only real safeguard against cholera is public sanitation in its broad sense, and in its application to individuals accompanied by a vigilant observation and inspection of all shipping and immigrants arriving in this country from infected ports and centres. The first is not only effectual against cholera, but against any other epidemic disease. The latter implies in this country arrangements for the isolation of all cases of cholera or suspected cholera that might be landed, and the prohibition of passengers by infected vessels from landing who cannot give any precise address in view of their being

kept under notice and their subsequent medical history traced and observed. The temporary detention, cleansing and disinfection of a ship and the discharge into the sea of dirty bilge and tank water used on the voyage are requirements to which most persons, apart from any cholera theories or hypotheses they may entertain, could not reasonably object. It seems to us that the chief thing that still remains to be done is to develop and perfect the necessary machinery in these directions. Notwithstanding, however, that as a nation we are believers—we had almost said worshippers—of the trite saying that “nothing succeeds like success” and that the measures adopted by the Local Government Board have hitherto been most successful, there are many people in this country who are clamorous for the adoption of more extensive and stringent measures, and who would not stop short of the old system of quarantine, which, besides being an anachronism in the present age, inflicts the largest amount of suffering and inconvenience and future danger in order to secure the minimum amount of security in the present. What are the facts? Cholera has been introduced at numerous ports and places in this country, but we have hitherto had no outbreak or epidemic here. It may be that the measures adopted have arrested its progress. It may be that an epidemic manifestation of its activity is only suspended for a time, but the fact remains. For the present, at any rate, this country is quite free from cholera. Notwithstanding that the disease has prevailed in France since April last, and lately at Havre and other places, and that there has been free and constant communication between the two countries from April to the present time; notwithstanding that cholera, advancing by another and independent route, reached the Caspian in June last and St. Petersburg in August and then Hamburg, and all the facts connected with its subsequent medical history, this country has been free from that disease; notwithstanding that we, as an Imperial Power, may be likened to a wasp, with England as the head at one extremity and India at the other, united by a narrow waist, the Suez Canal, and that we have a larger, more direct, constant and, it may be said, organic connexion with the home of cholera than any other country, we have nevertheless suffered less from that disease in England and had greater experience in the management of it in India than any other country in Europe. The *Frankfurter Zeitung*, in advertising to Professor Virchow's recent visit to Russia and his return to Berlin, improved the occasion by urging its readers to regard the matter practically, to press on the Government the necessity for more thorough attention being given to public health and sanitary reforms upon the model of Great Britain. What has been done in this country up to the present time has, at any rate, been successful; it has been prudently designed to achieve its object with the least amount of hardship, suffering and public inconvenience, and it has consequently been practicable. It is only by deliberate and well-considered action, and not by adding a stimulus to terror or by appeals to unreason that anything useful can be done. That it is easy to create a state of terror about the infectious nature of cholera and the danger of its importation is perfectly clear from all that has recently taken place at the New York quarantine station and the conduct of the unthinking, panic-stricken people of Fire Island towards the healthy passengers who desired to land from the steamer *Normannia*. It seems strange, in a country with such an extent of territory and unbounded resources as America and accustomed to the wholesale arrival of emigrants from all parts of the world, that some safe place for their temporary detention should not have been provided, with a due regard also to their health, comfort and food-supply. The appalling mortality on board the steamer *Scandia* was, no doubt, mainly attributable to overcrowding and other local insanitary conditions, about which we shall have something to say hereafter. For the present neither the discovery of the comma bacillus nor the anti-choleraic inoculation of M. Haffkine will practically avail us anything in the way of prevention. The plain duty before us is to adopt measures of proved efficacy and apply them in a similar way to what we should do in the case of any other epidemic disease, and not to supplement evils which are unavoidable by others of our own production, or establish nurseries for the development of cholera by crowding together numbers of half-starved, frightened suspects into quarantine quarters. It is easy enough to create a large amount of vicarious suffering amongst innocent people by such mistaken procedures without doing any good that could not, in our opinion, be obtained

by the simpler and more efficacious measures adopted in this country and India.

We are glad to notice a marked decrease in the number of cholera seizures and deaths in Russia, where the epidemic seems to be declining. When its statistics are compiled it will be seen that the epidemic has been one of the severest that has ever visited that country. At Hamburg the outbreak is of a severe and fatal type. From a return furnished by the Statistical Bureau of the total number of attacks and deaths up to the 10th inst., it appears that there were 13,238 cases and 5805 deaths. These figures show that, out of a population of 640,400, 20·7 per 1000 were attacked and 9·1 died. It is a curious fact that while the prevalence of cholera among our European troops in India have considerably diminished of late years, the mortality per cent. of those attacked has apparently greatly increased, and the increase cannot be accounted for by any change of diagnosis; for the figures recorded for the earlier period, from 1827 to 1851, all show a lower rate of mortality than those from that period up to the present time.

It has struck us as important to obtain some data from the past history of cholera which may serve to indicate approximately what we may expect as to the progress and direction of a cholera epidemic and as to the probable duration of an outbreak under various given circumstances, and for that purpose we have turned to the reports of the late Dr. Brydon, whilst statistical officer with the Government of India, which, apart from any theory or deduction of his, contain a mine of information on the subject. The track which cholera apparently pursues beyond Hindustan seems to be something as follows:—When an epidemic occurs throughout the Central Provinces its western extension is through Guzerat, Kurrachee, Southern Persia and Arabia to the Mediterranean. When the epidemic extends through Bundelcund, Agra, Ajmere and Cabul it travels towards Northern Persia and the shores of the Caspian. An epidemic commonly lasts, as we have said, three, or between three and four years, from start to finish. According to Dr. Brydon, the Indian cholera of 1830 appears to have extended from the Ganges to the Mississippi in less than two years, and was probably very nearly extinct in America and the greater part of Europe in 1833. It first appeared in England, Ireland and France in the spring of 1832. The intervals between one epidemic and the next are always uncertain and commonly long; but every epidemic of the disease in India does not, of course, extend beyond that country. Whether it proceeds exclusively by human intercourse or not, it usually happens that a relatively small percentage of the towns and villages are attacked in the province or area through which the epidemic is passing. Notwithstanding Professor Virchow's allusion to previous experience in Russia as to the continuance of the disease in winter, it may be safely said that cold weather is inimical to the progress of cholera. It is a matter of annually recurring observation in India that the disease vastly diminishes or altogether disappears there during that season. It must be remembered that in Russia, in addition to the presence of exceptional insanitary conditions which afford a more or less permanent cholera nidus, the dwelling-houses are exceptionally heated by artificial means in winter.

As regards the duration of an outbreak of cholera, this will of course be dependant upon conditions, such as the climate, the season in which the disease manifests itself, the soil, water—in short, according to the environment of the affected population. Still, the disease appears and rises to a maximum, and then the figures begin to tail off until it disappears altogether, although the insanitary state of the town or place often remains much the same as it was at the beginning of the outbreak. In some cases the outbreak lasts six weeks; in the majority of instances, where it was a severe and rapidly extending one, it occupies from three weeks to a month, and then rapidly declined. In the case of Hamburg the maximum number of attacks was reached in from ten to fourteen days and continued high for a few days longer, and then the number of attacks began slowly to decrease. In almost all cases of true Asiatic cholera the larger number of fatal cases occur at the beginning and of recoveries at the end of an outbreak. Children are very susceptible, but infants at the breast are rarely attacked. In the case of European regiments attacked on the march in India the duration of the outbreak is usually short. Out of a total of 197 fatal cases occurring under such circumstances 94 per cent. died during the first twelve days and only 6 per cent. afterwards. A regiment moving, unless it incurs

reinfection, usually parts with its cholera before the twelfth day. In the case of ships so much depends upon the extent of the overcrowding and other conditions. It is a noteworthy fact that cholera has sometimes occurred among troops coming from some infected place and been confined to them and has not spread to others on the same vessel. The well-known case of the *Renown*, published in one of the late Dr. Sutherland's reports, is interesting. Cholera appeared in the town of Gibraltar on Aug. 19th, 1865. On the 21st a wing of the 19th Regiment went on board the *Renown*, and a soldier was attacked and died of cholera. After an interval of thirty hours the ship put to sea. On Sept. 5th, a fortnight after the fatal case at Gibraltar, cholera broke out and lasted for fourteen days, till Sept. 19th. The *Renown* was far on her way to the Cape at the time of the outbreak, which exactly corresponded with the period of maximum intensity of the epidemic in Gibraltar. In outbreaks among troops stationed in the so-called endemic area and in the gaoles of Lower Bengal 90 per cent. of the cholera deaths occurred within the first fourteen days. In the gaoles of Upper India the duration of the outbreaks was much longer. A number of most competent pathologists and observers in this country and abroad regard Asiatic cholera as a specific infectious disease caused by the comma bacillus of Koch, but that it is not contagious in the ordinary sense of the term, being rarely communicated directly from person to person. The doctrine of specific infection involves of course the assumption of some definite method of introduction, and contaminated water used for drinking, cooking and washing is held to be the chief agent by which the choleraic infection is conveyed, to which may possibly be added in some cases the inhalation or swallowing of dust containing the specific cause. Everybody is agreed—whatever may be their views in these respects—on the essential importance of pure, uncontaminated water and the protection of all sources of water-supply.

We have already spoken of the marked success attending the Indian practice of camping out the troops on the occurrence of cholera, and it is a striking circumstance, as indicative of the influence of locality, that it has happened that troops, on returning to the barracks where they were first attacked, have been more than once reattacked and lost the disease by a fresh move into camp. The danger attending all overcrowding during times of cholera cannot be urged too strongly. The contrast between the steerage and cabin passengers on board steamers in this respect, the continuous occupation of hospital wards, the effect of dispersion as opposed to the aggregation of human beings, and the incidence of the disease among troops when they have been overcrowded in times of cholera, are all illustrations of its truth.

Before concluding we desire to call attention to the instructions of the Royal College of Physicians published by the Government. They appear to us to be plain and practical, and we are gratified to find that, in the main, the College adopts a line of management and treatment very much in accordance with that which we have ourselves indicated.

#### PROFESSOR CANTANI ON THE TREATMENT OF CHOLERA.

The *Berliner Klinische Wochenschrift* of Sept. 12th contains a lengthy article on the treatment of cholera by Professor Cantani, of Naples, who has had much experience of the disease in former epidemics in that city. He points out that sometimes the fatal stage of algidity and asphyxia is produced very rapidly, without any great loss of water and resulting blood inspissation which ordinarily characterise the attack; and he attributes the former to the direct action of the poison generated in the intestine (either directly or indirectly) by the comma bacillus. The indications of treatment are, he says, four in number—viz., to check the multiplication of the bacilli in the intestine; to neutralise the chemical poison formed in the bowel; to cause the speedy elimination of the poison from the blood; and to diminish the more or less marked degree of blood inspissation that ensues on the loss of water. The first two of these apply only to the earlier stages of the attack, the others to the treatment of declared and severe attacks. In addition, there are symptomatic treatment, warmth and nerve stimulation &c. Professor Cantani has long advocated the use of hot injections of tannin as of the greatest efficacy in early treatment, and he sees that their employment is

justified by what has since become known of the nature of cholera. No remedy given internally is so effective as this "enteroclysis," and the use of tannin is perfectly harmless; whereas injections of carbolic or boracic acids in sufficient amount to produce any effect only irritate the bowel and increase the risks of further mischief; whilst sublimate, by combining with albumen, forms a coating beneath which the bacilli still flourish. The acidity of the solutions and tannin itself, being distinctly bacillidal, meet the first indication above mentioned. Tannin has also been shown experimentally to neutralise the poison produced by the bacilli. Cantani has proved, moreover, that such injections, even in comparatively small amounts, pass up beyond the ileo-cæcal valve, and he maintains that no remedy, astringent or other, given by the mouth can exert such a marked local effect as the injections. From five to twenty grammes of tannin are suspended in from one and a half to two litres of water or camomile infusion, with twenty to thirty drops of laudanum and thirty to fifty grammes of gum arabic, the temperature of the fluid being kept as high as 39° to 40° C. This degree of warmth is an essential part of the plan, combating the tendency to algidity in as satisfactory a way as the hot bath (which is often contra-indicated by cardiac weakness) and stimulating the abdominal nerves. Professor Cantani gives statistics from his own experience of 1884 and that of Dr. Bela Angyan at Buda-Pesth, which bear out his assertion that when cases are treated by this measure in the earliest stages they all recover, and that even in the later stages the mortality is considerably reduced below the average. The action of the injections is better the longer they are retained, and whereas in milder cases it may only be necessary to administer three or four injections on a single day, in others the treatment requires to be carried on for several days. He cites the satisfactory results obtained at one of the cholera hospitals at Naples, where the nurses were instructed to administer the injections on the slightest sign of cholera. As confirmatory of the antagonism between tannin and cholera, he states that hardly a case of that disease occurred in the Naples tanyards, whereas among workers in the glove-leather factories, where tannin is not used, there were several attacked. The "enteroclytic" treatment, besides astringing the bowels and acidifying the intestinal contents, aids in their removal together with their toxic elements, and although it is possible that its early employment may lead to non-choleraic cases being treated, there is no harm in this, as it is quite as applicable for other conditions of diarrhoea arising from abnormal fermentation. He gives no drug internally at this stage, but allows small quantities of water or ice, old red wine, champagne, Bavarian beer, or lemonade made with hydrochloric or lactic acids, or lemons with the addition of a little cognac. The dangers of the algide stage depending on the poison in the blood paralysing the nerve centres and heart muscle, and also on the inspissation of the blood impeding the action of the heart and tending to accumulation in the small vessels and thus diminishing oxygenation, can only be met by bringing into the blood and tissues as much water as possible. This has been long recognised and is the reason for treatment by intra-venous saline infusion as used by Hayem, but with not very satisfactory result. Professor Cantani himself has employed the subcutaneous injection (hypodermoclysis) of hot saline solutions (four grammes of sodium chloride, two grammes of sodium bicarbonate to a litre of water, at 38° to 40° C.), two amounts of about half a litre being injected at the same time. He says this fluid is rapidly absorbed and gives the remarkable statistics of 187 cases thus treated with 114 recoveries, or a mortality of 39 per cent.—i.e., of severe cases be it noted. The injections should be given at the beginning of the algide stage, and the sites selected have been generally the ileo-costal, lumbar, interscapular or gluteal, and the injection is generally made in two places at the same time. Professor Cantani gives several reasons for preferring this to the intravenous plan; whilst of injections into the pleural and peritoneal cavities there is, he says, but little experience. At the same time he points out that his tannin-enteroclysis also affords a means of supplying water to the organism, and since adopting this method of treatment he has had less occasion to resort to the hypodermic injections. The principles, then, of his plan of treatment are clear and defined. To anticipate the inspissation of blood and prevent accumulation of the cholera poison and excretory metabolic products in the tissues, the hot tannin injections must be practised from the very first—

the initial choleraic diarrhoea—and repeated after every motion; and when the algide stage begins, either because the tannin treatment has been delayed or too seldom repeated, then this must be combined with the hypodermic method. The scientific treatment of cholera demands therefore the utmost care and vigilance on the part of the physician and nurses, who should have the moral support of the family. In the final or reaction stage—miscalled "cholera typhoid"—where there is no longer a question of choleraic poisoning, but rather of its effects, he recommends the free drinking of water and some stimulant, which, if the stomach be intolerant, must be given by enemata. Here again he has sometimes employed acid solutions—tannin or hydrochloric acid (3 to 5 per cent.) or simple saline solutions (10 to 15 per cent. of common salt). But in cases where the reaction is severe he recommends warm saline hypodermic injections. At the close of his article he refers to the question of preventive inoculation, which has hardly got out of the experimental stage, and hints that the fact of two or three recurrences of cholera in the same subject within a short space of time is not favourable for the success of such a practice. Although we may hope in the future to have more certain preventive measures, at present all we can do is to treat the disease on rational principles.

#### PRECAUTIONS AGAINST CHOLERA.

The following is a copy of correspondence which has passed between the Local Government Board and the Royal College of Physicians on the subject of cholera precautions:—

Local Government Board, Whitehall, S.W.,  
Aug. 20th, 1892.

Sir,—I am directed by the President of the Local Government Board to inform you that the Board are prepared, in case of the extension of cholera into England and Wales, at once to issue regulations, under the Public Health Act, 1875, and the Public Health (London) Act, 1891, to the local sanitary authorities.

These regulations will, amongst other things, require the local sanitary authorities to provide and to dispense, without charge, "medicines and medical appliances" for the sick.

The Board consider that the local authorities of England and Wales would attach great value to the medicines which the Royal College of Physicians consider to be best adapted to the immediate medical treatment of patients suffering from cholera, choleraic diarrhoea or diarrhoea.

And I am therefore to ask that the President of the Royal College of Physicians will be good enough, at as early a date as possible, to communicate to the Board prescriptions as to the remedies which the College may think most suited to the requirements in view.

I am, &c.,  
HUGH OWEN, Secretary.

The Registrar, Royal College of Physicians,  
Pall-mall East, London, W.

Royal College of Physicians, Sept. 3rd, 1892.

Sir,—In complying with the request of the Local Government Board to furnish it with instructions for the management of health in view of the prevalence of diarrhoea and of cholera, the Royal College of Physicians desires to say that the instructions herewith submitted are not intended either to occupy the general ground of prevention so ably and admirably covered by the medical advisers of the Board, or to supersede the necessity of immediately summoning medical assistance to those stricken with disease. They are meant to be followed only when the assistance of a doctor cannot be procured and when diarrhoea has not developed into cholera. The College proposes no instructions for the treatment of cholera. Every case of this disease requires separate consideration and management; no stereotyped plan of treatment would prove to be either wise or safe; and usually before the choleraic nature of an attack could be established medical assistance would have been procured.

The chief instructions to be followed for the prevention of diarrhoea and of cholera are herewith appended:—

1. As cholera is not, in the ordinary sense of the term contagious, as it is rarely, if ever, communicated, like small-pox or scarlet fever, directly from person to person; as it is probable that those engaged in attendance upon patients suffering from this malady are not more liable than others to become attacked with it; and as it is certain that physical and moral depression favour the reception and development of the disease, apprehensions should be allayed, confidence encouraged and that manner of living pursued which experience has proved to be conducive to the highest health.

2. The house should be clean, light, thoroughly dry and well ventilated. Air shafts, traps and drains should be in perfect working order. Dustbins should be frequently emptied and no decaying matters of any kind should be permitted to remain in or near the house. Cisterns, reservoirs, casks, jars and pipes used in the preserving, carrying or transmitting of water should be frequently inspected and carefully cleansed. All connexions of waste pipes with drains should be severed.

3. As water is one of the chief agents by which choleraic infection is conveyed, all water employed for personal and domestic use in the household should be scrupulously protected from contaminations of every kind; and if any doubts of its purity arise the water should be boiled, filtered and consumed within twenty-four hours. Boiled and filtered rain-water is probably the best of all waters for use at this time.

4. The dietary should consist daily of three or four simple but nourishing and ample meals, taken at regularly recurring times. The

meals may consist of any sort of animal food, fresh and thoroughly cooked, of bread, potatoes, well-boiled green vegetables, if they agree, and of plain farinaceous puddings, or of simply cooked, wholesome fruit.

Milk should be boiled before use.  
Alcoholic beverages should be taken in great moderation, and only at the greater meals, such as at dinner and supper.  
It is desirable to avoid soups, tinned or otherwise preserved provisions, raw or stale vegetable, unripe, over-ripe, or decaying fruits, pastry, cheese, nuts, hard or indigestible things of every kind, malt liquors turning "hard," ginger beer, strongly ascendent sparkling wines, coarse oatmeal gruel, messes between meals, and either long fasts or too frequent feeding.

6. All provisions should be procured fresh and fresh, but when some storage is unavoidable the most scrupulous care should be taken to protect them from contamination by impure air or water.

Cooking utensils should be scalded after use and kept carefully clean.  
6. Avoid the use of strong aperients, and especially of strong saline aperients. If there is obstinate constipation take at bedtime either a teaspoonful of Gregory's powder or one or two teaspoonfuls of castor oil.

7. Avoid excess and irregularities of every kind, over fatigue, prolonged watchings, emotional excitations, undue mental strain, and all such things as irritate and exhaust the nervous system.  
Especially avoid the frequent use of alcoholic or of any stimulants to cover recurring sensations of sinking, malaise, or depression.

8. Take moderate exercise twice daily, follow early hours, and aim at leading a regular, an occupied, and a tranquil life.

CONCERNING THE MANAGEMENT OF LOOSENESS OF THE BOWELS.

9. If, notwithstanding this careful regulation of the manner of living, looseness of the bowels should set in, send immediately for medical assistance, since without personal examination and direction no case of this kind, arising in such circumstances, can be satisfactorily or even safely managed. But if medical assistance is not immediately available, follow the subjoined instructions until the doctor arrives.

10. Choose, if practicable, a bright, airy room, go at once to bed, keep quite warm, and if troubled with cramps or pains apply hot applications to the entire stomach.

11. Take freshly prepared fluid or semi-fluid food in quantities of a large cupful at a time regularly every three hours. Such food may consist of boiled milk thickened with rice flour, baked flour, or biscuit powder: of tea made with boiling milk infused about five minutes, and having toast, biscuits, or rusks soaked in it; of farinaceous puddings of the nursery sort; of any kind of gruel, except that made with coarse oatmeal; of meat jelly, of beef tea, or of mutton, chicken, or veal broth.

If pain persists with depression or faintness, take a tablespoonful of brandy or of whisky in a small claret glassful of hot water after meals, twice, thrice, or four times in the course of the twenty four hours, but not oftener than is absolutely required for relief.

12. If thirst becomes excessive, sip from time to time small quantities of iced water just sensibly acidulated with fresh juice of lemons or with aromatic sulphuric acid.

13. As soon as possible after looseness of the bowels has begun, take in capsules or in hot milk, or in any other manner preferred, two teaspoonfuls of castor oil. If when the action of the oil may be fairly supposed to have ceased the looseness increases to a watery diarrhoea, let the hips be well raised and carefully inject into the bowels a quart or more of hot water containing two drachms of benzoate of soda or thirty grains of tannin. Furthermore, if there be much pain in the bowels, fifteen to thirty drops of laudanum may be added to the injection. The injection should be retained as long as it is comfortable to the patient, and it may be repeated once or twice daily during the continuance of the diarrhoea and until medical assistance has been procured.

14. After the administration of the injection, if one has been found necessary, the following mixture should be taken at intervals of from three to four hours, according to the urgency of the symptoms:—

R.—Mist. Cretae Aromat. 1 oz., Tinct. Camph. Comp. ʒ drachm, Tinct. Chloroform. Comp. 20 drops, Sp. Ammon. Arom. 20 drops, Cerif. et Bismuthi Salfeyi. 5 grains, Ess. Mentha Pip. ʒ drachm. Fiat dos ʒ.

15. Should this mixture disagree, or in twenty-four hours fail to give relief, the mixture following should be substituted and taken every three or four hours:—

R.—Acid. Sulph. Arom. 15 drops, Tinct. Camph. Comp. ʒ drachm, Tinct. Chloroform. Comp. 20 drops, Tinct. Coto. 20 drops, Syrupi Auranti Flor. 1 drachm, Aq. Mentha Pip. ad. 1 oz. Fiat dos ʒ.

16. From the first appearance of looseness of the bowels the body should be washed with warm water night and morning and quickly dried; soiled bed or other clothing should be immediately disinfected and destroyed.

A cheap and efficient disinfecting fluid is recommended by Dr. Thorne Thorne, and is thus prepared:—Dissolve half an ounce of corrosive sublimate and five grains of commercial aniline blue in three gallons of water and add thereto one fluid ounce of hydrochloric acid. Preserve in earthenware jars or wooden tubs.

17. All further general precautions necessary to be taken at this time are admirably set forth in the memorandum issued on Aug. 26th by the medical officer of the Local Government Board.

I have, &c.,

ANDREW CLARK, M.D., President of the Royal College of Physicians.

WM. HENRY ALLCHIN, M.B., Vicarius for Edward Living, M.D., Registrar.

To Sir Hugh Owen, K.C.B.

The following notice has been issued from the General Post Office:—

Information has been received from the Greek postal authorities that no parcel mails from this country will at present be allowed to enter Greece, and that no sample packets must be included in the ordinary mails. Until further notice, therefore, it is useless to post either sample packets or parcels intended for conveyance by parcel post, addressed to Greece.

THE CHOLERA EPIDEMIC IN PARIS.

Our Paris correspondent informs us that the outbreak of cholera in that city appears to be stationary in its progress. The figures are:—

		Fresh cases.	Deaths.			Fresh cases.	Deaths.
Sept. 8th	Paris	63	40	Sept. 11th	Paris	34	17
	Suburbs	22	12		Suburbs	10	4
" 9th	Paris	47	27	" 12th	Paris	32	12
	Suburbs	32	10	" 13th	Paris	38	11
" 10th	Paris	32	12	" 14th	Paris	33	12
	Suburbs	19	17	" 15th	Suburbs	26	6

At Havre the situation has greatly improved, only twenty-four cholera patients being (Sept. 13th) under treatment at the Eastern Hospital. The municipality has just engaged 400 scavengers, whose duty it is to water and clean the streets. The decree establishing a sanitary cordon on the frontier has been (Sept. 12th) extended to all parts of France and Algeria for all entries from cholera contaminated ports.

THE CHOLERA IN GERMANY.

Our Berlin correspondent states that the statistics of the cholera epidemic in Hamburg have been revised by the Statistics Office there, with the following result:—

		Cases.	Deaths.			Cases.	Deaths.
On and before				On Aug. 31st		858	395
Aug. 20th	..	86	36	On Sept. 1st	..	813	394

" 29th	..	1080	484				

The total population of Hamburg and the territory belonging to it is 640,400; the number of cases hitherto amounts to 20·7 per 1000, the number of deaths to 9·1. In the week which ended on Aug. 20th the death-rate of Hamburg and its suburbs was 32·7, in the following week 150.

Army Surgeon Dr. Weisser, a former assistant of Professor Koch, is examining the water of the Elbe for comma bacilli. On July 9th, 1890, the Senate of Hamburg resolved to erect filtering works at an expense of seven million marks (nearly £350,000), but this plan has not yet been executed. At its meeting on the 7th inst. the Berlin Medical Society discussed the subject of cholera. Professor Virchow, who presided, declared the fact that, though isolated cases had been carried to great distances from Hamburg, no epidemic had broken out anywhere in Germany except in that city, to be highly reassuring. He regarded disinfection on the frontiers as inexpedient. River water was a very essential element in the spread of cholera.

As there is a brisk traffic on the water-way between Hamburg and Berlin, and it is well known that bargemen try to conceal cases of illness that occur among them, a steamer with a doctor on board has been ordered to cruise on the Howel. The doctor has to examine the inmates of all the barges, and send those he suspects of having cholera to a hospital improvised for the purpose.

THE CHOLERA AT GLASGOW.

The following is a short synopsis of the notes on the two cases of cholera under treatment at the City of Glasgow Fever Hospital, Belvidere. Dr. W. A. Parker, has been good enough to furnish the notes.

CASE 1.—M. D—, aged about thirty-five, was admitted at 1 A.M. on the morning of Aug. 27th. No accurate history could be got from the patient, but he stated that he had been ill for four days, and he had certainly diarrhoea throughout the 26th.

On admission the eyes were sunken; hands and feet dark, cold and shrunken; no marked perspiration, with a stricken look; nose red and congested; very restless, with palpitation; pulse miserably small and poor, and at times imperceptible. At 1 and 3.15 A.M. there were milk-like motions; also everything was rejected, there being copious watery vomiting with flocculent masses in it, coming in sudden gushes; thirst excessive; the tongue showed a light white fur, but was moist; there was pain over the kidneys and severe pain across the chest; an ounce of urine was passed, loaded with

albumen. At midnight the pulse was better (90), also the general aspect was less livid and blue; the pupils were normal in size, reacting to light; the vomiting continued, though less frequently; there had been no further motion of the bowels, but another half-ounce of urine had been passed; the voice was less peculiar and husky.

Aug. 28th: Distinctly better; surface warmer and less livid; pulse stronger; restless, with tendency to delirium; no motion of bowels, and only half an ounce of urine passed; vomiting less; thirst continues; hiccough distressing.—29th: Vomit bilious; took nourishment better; hiccough less; no urine or motion passed; vomited two round worms.—30th: The temperature reached 98.2° for first time (previously subnormal); thirteen ounces of urine passed, with 1-12th column of albumen; vomiting and hiccough slight.—31st: Forty-one ounces of urine passed; much less albuminous.—Sept. 1st: Marked muscular tenderness, about legs and great pain on bending knees; tongue furred again; breath foul; copious bile-coloured stool after enema.—2nd: Muscular tenderness about legs and cramping abdominal pains; tongue covered with thick yellow fur; urine improving; no vomiting.—3rd: Three loose greenish-yellow motions, followed at 4.50 p.m. by a sudden and seemingly involuntary motion of a loose, green, offensive kind; otherwise seems well.—4th: Thirst continues; four loose green motions; scanty, discrete, papular, itchy eruption on flexor aspects of arms.—5th: Urticaria-like rash continues and involves trunk and limbs; eight loose green motions; evening temperature 100.6°; pulse 100, thin and feeble, but regular; skin has a very peculiar offensive odour.—6th: Evening temperature 99.4°; nine loose, green, chopped-vegetable-like motions; urine improving; pulse better; rash still bright.—7th: The patient had three loose, green, chopped-vegetable motions of acid reaction before 11 A.M., but none since; tongue cleaning and he seems better; rash is fading; best seen on extensor surfaces of limbs. The urine is almost free from albumen; its reaction has all along been acid.

The treatment on admission was dilute sulphuric acid with opium; free stimulation with brandy; iced water *ad libitum*; since then the treatment had been symptomatic. The temperatures were as follows in M. D.—'s case:—Aug. 27th: morning, 96.4°; evening, 95°. 28th: morning, 97.6°; evening, 96.4°. 29th: morning, 96°; evening, 97.6°. 30th: morning, 97°; evening, 98.2°. 31st: morning, 98.2°; evening, 98.2°. Sept. 1st: morning, 97.6°; evening, 98.6°. 2nd: morning, 97.6°; evening, 98.6°. 3rd: morning, 97.6°; evening, 97.8°. 4th: morning, 96.4°; evening, 97.4°. 5th: morning, 98°; evening, 100.6°. 6th: morning, 98°; evening, 99.4°. 7th: morning, 97.8°; evening, 97.2°.

CASE 2.—F. A.— was admitted between 9 and 10 A.M. on August 27th. She stated that she had been suffering from diarrhoea since the 24th, vomiting commencing soon after. Headache had all along been present and cramps in the feet were early and severe. At the onset there was a sense of great heat in the head, chest and abdomen, which in the abdomen lasted into the stage of collapse.

On admission the patient had a temperature of 94.6°. The surface was cold, the limbs especially; no distinct perspiration. The pulse was 100, poor and soft. There was great restlessness; eyes sunken, with sluggish, dilated pupils; nails markedly livid; peculiar husky voice. She complained of cramps in front of the legs and across the chest, with a sense of abdominal heat; frequent watery vomit. The patient was menstruating (sixth day); no urine passed; no motion (bowels were moving up to admission); great thirst.

Aug. 28th: Stronger pulse; less lividity; warmer surface; an ounce of urine passed; round worm vomited; three copious rice-water motions.—29th: Vaginal discharge severe; flushed and distressed looking, with cold extremities; headache and slight cramps in legs; three rice-water motions; twice in the evening the vomit was bilious; slight hiccough; two ounces and a half of urine passed; temperature normal for first time in evening, previously subnormal.—30th: One slight rice-water motion; vomit bilious; six ounces of urine passed; discharge from vagina much less.—31st: Nineteen ounces of urine passed, loaded with albumen, but no blood; scarlet-like blush on limbs and face.—Sept. 1st: Passing urine freely; no vaginal discharge, vomit or motion; rash fading.—3rd: Albumen decreasing in urine.—4th: Two copious green motions after castor-oil enema.—6th: Three copious loose yellow motions after taking two drachms of castor oil; urticaria-like rash beginning to appear on trunk and arms, just as in the other case, but quite

different, and taking no drugs.—7th: Rash more general and more of the urticaria type, but left a staining; otherwise well. The temperatures were as follows:—Aug. 27th: morning, 94.6°; evening, 96.2°. 28th: morning, 97.0°; evening, 97.8°. 29th: morning, 97.6°; evening, 98.6°. 30th: morning, 97.0°; evening, 97.6°. 31st: morning, 97.4°; evening, 98.4°. Sept. 1st: morning, 97.2°; evening, 98.4°. 2nd: morning, 97.4°; evening, 97.6°. 3rd: morning, 97.2°; evening, 97.6°. 4th: morning, 97.8°; evening, 98.8°. 6th: morning, 98.4°; evening, 98.2°. 7th: morning, 98.2°; evening, 99.2°.

The treatment was, as in the other case, dilute sulphuric acid and opium at first, with symptomatic treatment afterwards. Free stimulation with brandy and ice-water *ad libitum* were also had recourse to.

Belvidere.

## THE CHOLERA IN BELGIUM.

(FROM OUR SPECIAL CORRESPONDENT.)

### THE SANITARY CONDITION OF ANTWERP.

AFTER what I had seen and described last week my first care was to call upon the town engineer. At the Town Hall I was received with much courtesy and every information placed readily at my disposal. The drainage of Antwerp is a matter of some difficulty, as the ground is flat and there is hardly any fall whatsoever. On the other hand, there is a powerful tide in the river Scheldt, which can be and is extensively utilised for flushing purposes. Almost all the streets of Antwerp have sewers of various shapes and sizes, some well built and some badly built. The main drainage system may be described as the conversion of the old historical moats into main sewers. As one set of fortifications composing the city wall was pulled down and a larger wall built further off, what had served as the moat of the inner wall became the main sewer. Antwerp has been enlarged in this manner seven times. The last of these moats now constitutes the magnificent semicircular boulevard known as the Avenues of Commerce, of the Arts and of Industry. Here is an enormous sewer, in many places more than sixteen feet wide, in which boats are easily navigated. At high tide this immense underground canal is filled with water and at low tide the water is discharged into the various sections of the sewers, which are thus flushed out, the whole ultimately reaching the Scheldt. At Antwerp this river is sixty miles from the sea, and a third of a mile broad and thirty feet deep at high tide. In spite of the powerful flush thus given I noticed some very characteristic and unpleasant odours emanating from the sewers in the neighbourhood of the cathedral. I was told also that a number of sewers converge and meet together under the church of St. Paul, where they constitute a large lake. The pillars of the church are sunk through the sewage to find a foundation underneath, and it appears that it is a curious sight to visit, in a boat and with torches, this sort of crypt full of sewage. I need hardly point out that this does not correspond with any known and approved system of drainage. A sewer, on the contrary, should be small—small enough to be at least half filled with water every day. It can then be considered self-cleansing if the fall is sufficient and the flush ample. In large sewers, where the water is shallow and travels slowly, dangerous deposits are made and sewer gases are extensively generated.

According to a regulation brought into force some twenty years ago drainage into the sewers was forbidden except in the case of kitchen water and rain water. This regulation decreed at the same time that houses should be provided with well-built, water-tight cesspools. The closets were each to have a syphon trap to prevent the gases from the cesspool penetrating the houses or courts, and finally the cesspools were to be emptied by the pneumatic system, which draws the material from the cesspools by suction and burns the gases in the fire of the engine. The operation thus carried out causes but little or no nuisance. Such is the Antwerp system of drainage, a system that has been condemned by the immense majority of hygienists, which term, I take to comprise doctors, chemists, architects and engineers. But, bad as the system is, the results would be much more favourable if it were strictly applied. A census taken on Dec. 31st, 1890, establishes that there are 29,335 houses in Antwerp, inhabited by 238,788 persons. Last year an

inquiry was made by the municipality as to the manner in which the inhabitants of Antwerp dispose of the matter contained in their cesspools; 101 persons, it was then ascertained, sold the contents to agriculturists, who fetched it away; then 910 persons emptied their cesspools on to their own gardens; 355 other persons did the same, but paid the tax to the town as if they had their cesspools emptied by the pneumatic system. Thus we have a total of 1566 houses where the emptying of the cesspools must cause a fearful nuisance, since the pneumatic system is not employed, and out of this total in only 101 cases is the nightsoil taken out of the town; for the rest it is used to manure gardens within the town. In 237 houses (if the technical Flemish word was correctly translated into French) there were cesspools which were expressly constructed to allow the contents to leak away into the subsoil. There were 134 houses where the inhabitants had no knowledge whatsoever as to the situation of their cesspools, and therefore these cesspools had evidently not been emptied during the existing tenure. In twenty-four cases the cesspools formed part of manure heaps, and in thirty-four houses the opening to the cesspool was under a wall or pavement, and considered inaccessible. Finally, there were 1020 houses that drained direct into the sewers. Thus we have a grand total of 3015 houses where the regulations drawn up by the municipality are not applied. To what extent the numerous houses occupied by poor people, where the cesspits or middens have no covering, are comprised in the above enumeration, I am unable to say. There was no attempt made to deny the existence of the grievance denounced in my last letter. It is acknowledged that in the poor quarters, and more especially in the quarters where most of the cases of cholera have occurred, there are numerous middens, and that the odour from these middens escapes into the yards and houses, for they are only covered with a wooden seat. There is no pan underneath the hole in the seat, still less is there a syphon trap below the pan. Such closets are contrary to the regulations, and yet they are tolerated to a wholesale extent. Close to these middens, sometimes only separated by a narrow brick wall, are wells from which the drinking water is taken. What is more remarkable and more reprehensible is the fact that this state of things prevails precisely in that part of the town where I should have imagined the authorities would have exercised the greatest severity in the application of their regulations. Here live the poorest inhabitants of Antwerp, and here will be found the most over-work, under-feeding, drunkenness and overcrowding. Yet cleanliness prevails; the floors of the rooms are constantly scrubbed, the bedding is fairly clean, the seats of the closets are washed and rarely soiled. In London such a population would be infinitely more dirty. In similar quarters of London there is a great deal more superficial dirt, but there would never be such organic defects of construction. The lower classes in Antwerp have done as much as can be expected from people ground down by poverty. It would be a great benefit if the London dock and his neighbours could imitate the Flemish cleanliness, and it is a thousand pities that the Antwerp authorities do not support this excellent disposition of the population by at least applying the regulations they have themselves drawn up. The authorities have full powers to do this. The local medical commission has the right of inspection. On a report of this commission the burgomestre can order the necessary alterations and repairs, and he can insist that they should be undertaken within a fortnight of the time when the notices are served. Now, from Jan. 3rd, 1888, to Sept. 2nd, 1892, the number of houses or cases of sanitary defects reported amounted to 1002. The present condition of Antwerp shows that this was absolutely insufficient, though I do not desire to infer that the local medical commission had in any way neglected its duties. My object rather is to point out that Antwerp urgently needs a well-paid, highly qualified sanitary inspector with a staff of assistants whose sole business it shall be not to wait till complaints are made, but to go from house to house and ferret out every case where the regulations are not strictly enforced. Bad as these regulations are, their application would be a considerable improvement on the present state of affairs. Every householder could then be made to trap his closets, close over his cesspools and to empty them by the inodorous pneumatic system.

With regard to the water-supply, it would not be so easy to bring about the necessary improvement. There is a private company which provides Antwerp with water. This water is taken from the Nethe, near Marlines; not at the source, but

in the very middle of the river. The Nethe falls into the Roupel, which, in its turn, joins the Scheldt. The water is purified by being mixed with fragments of iron, so that its salts coming in contact with the air form oxides of iron. It is then filtered through about four feet of sand and delivered in the houses of Antwerp under a pressure of three and a half atmosphere, which, however, can be increased to five atmosphere in case of fire. This water, I was assured by several persons, has a taste of sand and it is not liked by many of the inhabitants. Though the chemical analysis shows the presence of ammonia, the sanitary medical authorities look upon the water as safe because it bears successfully the test of bacteriological examination. In a word, the water is considered not nice, but wholesome, and is therefore infinitely safer than the water, generally more pleasant to the taste, taken from wells in close proximity to cesspools. The maximum amount of water supplied by the company in one day was 9000 cubic metres. The usual consumption varies from 4000 to 5000 cubic metres per day, and this could be raised to 15,000 cubic metres. It is estimated that in Antwerp about 45,000 persons receive the company's water, so that four-fifths of the population drink water from private or public wells. It is difficult to conceive how, in the face of such a fact, the cesspool system can be maintained. Obviously cesspools and wells cannot be allowed coexistence. One or the other, if not both, must disappear. Most hygienists condemn both wells and cesspools when either the one or the other is found in a town. None defend the combination and proximity of the two.

Occasionally a police inspector at Antwerp takes a sample of water from a private well and causes it to be analysed. If the water is found to contain a notable quantity of nitrates the owner of the house is summoned to provide suitable drinking water under the penalty of having the dwelling closed as unfit for habitation. But he cannot be compelled to take the water of the company; such compulsion would imply the employment of police force to promote the financial interests of private persons. Had the water-supply been in the hands of the municipality the case would be altogether different. Compulsion could then have been brought to bear, as it could not be said that such coercion was exercised in the interests of individuals. The interests served would have been purely public interests—those of the public health on the one hand and those of the public purse, or municipal receipts, on the other. As matters now stand, when a well is condemned—a rare occurrence, unfortunately—the landlord has simply to dig another well a few yards off, where, doubtless, the water at first obtained is not contaminated. The town, it should be observed, has reserved for itself the right of opening ten public fountains in poor districts, where the company's water is given gratuitously; and it is a significant fact that some other public fountains which supplied well water have had to be closed quite recently, because these waters were recognised to be impure. At a certain Coöperative Bakery and Club, where 7000 to 8000 kilogramme loaves of bread are made and baked per day, the water to make the bread is taken from a well in proximity with three cesspools. At the club many trade societies meet, eat and drink. There are often several hundred workmen on the premises, and they help to fill the cesspool close to the well from whence they derive their drinking water. If once this well is contaminated the most widespread mischief will result.

The water supplied to sea-going ships is the water of the company, which, as already explained, is the safest available at Antwerp. It will interest English travellers and tourists to know that even this water is rarely taken on board the Harwich and Antwerp boats. These passenger steamers are provided with water at Parkeston Quay. They only take in water at Antwerp when the ship's supply has run short in consequence of an exceptionally large crowd of passengers. This of course only occurs during the height of the tourist season. On calling at the company's offices to make inquiries I was assured that no water had been taken on board at Antwerp since the outbreak of cholera. Indeed there was no need of doing so, for the number of passengers has been greatly reduced since the cholera scare. This is much to be regretted, for unjustifiable panics supply arguments to those who urge that the truth should be concealed. Even if instead of a few cases the cholera was raging at Antwerp, the landing stage of the Harwich steamships is far removed from the town, and there are no habitations near. There can be no risk therefore in stepping from the steamer to the train that awaits the arrival of the boat.

If the water-supply of Antwerp is deficient and the drainage system bad the town has at least the advantage of possessing an admirable hospital. It is built on the circular system, especially designed for contagious diseases, and provided with both mechanical and natural ventilation. But the hospital is well known. It is a model establishment; it has been visited by hygienists from all parts of the world and has been very generally admired. Up to Sunday last 101 cholera patients had been treated in this establishment. If the patients were brought in a carriage the carriage was fumigated, then thrown open and left exposed to the air for twenty-four hours. Those persons who bring the patient or who inhabit the same house are conducted to the hospital bathing department and compelled to take a hot bath. While in the water their clothes are disinfected in a dry-heat stove which is always kept ready. These persons are then retained in the hospital or sent to the sanitary dépôt for twenty-four hours. In the interval the house whence the patient has been taken is thoroughly disinfected. The hospital authorities hope shortly to be able to replace their dry-heat stove by a stove where the clothes will be disinfected by steam superheated under pressure. To be ready for emergencies, and as an experiment, a wooden hut capable of holding thirty patients has been built in a flat by the side of the hospital. It was thus ascertained that huts of this description could be put up in five days, and there is plenty of room for more huts in the same field. As yet, however, all the patients have been treated within the walls of the hospital. If, therefore, in respect to general sanitation, drainage and water-supply, there is much in Antwerp calculated to encourage the development of cholera and other diseases, very excellent provision is made to deal with each case and to stamp out the danger of infection, if this has not already reached the drains.

As there have been cases of cholera in all parts of the town there is no disguising the fact that a widespread epidemic may break out in Antwerp, more probably next summer than this autumn. The authorities, let us hope, have therefore the whole winter before them to make a house-to-house visitation, commencing of course with the poorest quarters. All private wells near to cesspools should be closed, all cesspools should be covered over and closets with proper traps provided. This much at least could be completed before next summer, though this would only be patchwork and a temporary mitigation of existing evils. Ultimately a better water-supply must be organised and a proper system of drainage created. As Antwerp is exceptionally flat, it is in such a town that the separate system would be most appropriate. The existing sewers could continue to convey the rain-water to the river, while small pipes placed within these sewers would deal with the slop-water and soil. It follows of course that cesspools would be abolished. Till this is done Antwerp cannot claim to be considered a sanitary town. Nor is there any reason to believe that these indispensable reforms will be long deferred. If such benighted places—from a sanitary point of view—as Marseilles can be induced to build a proper drainage system, Antwerp will not tarry in the rear. The authorities at Antwerp have already shown much energy and good will in this respect. They have pulled down abominable rookeries, built magnificent streets and reduced the death-rate to about 22 per 1000 per annum. They may be trusted to continue and complete the good work begun.

Antwerp, Sept. 12th.

#### A VISIT TO BOOM.

Dr Desquin, President of the Provincial Medical Commission, having, with much kindness and courtesy, allowed me to accompany him on a tour of inspection, I have just visited the small town of Boom. It took half an hour to reach this place by the railway from Antwerp, and as we arrived when the tide was out, I had an opportunity of seeing the dirty character of the mud deposited on the banks of the Roupel. The water itself was very thick and muddy and here and there I noticed large quantities of shining grease floating on the surface. At the Town Hall of Boom we found the Burgomaster, the five local practitioners, the chief of the police and other persons, who together constitute the Local Sanitary Commission, waiting to receive us. I avail myself of this opportunity of thanking these gentlemen for their courtesy and the willing assistance they rendered. The Commission at once proceeded to business and it was decided that the local fête or kermesse which was to be held in a fortnight's time should be indefinitely postponed. Boom,

I should explain, is a large district almost wholly given up to brick and tile making. Along the water's edge, for a considerable distance, there are numerous small landing stages where barges come to load bricks. The Commission discussed lengthily as to how these barges could be watched, and it was decided that this duty should be left to the two *gardes champêtres*—rural functionaries who act as gamekeepers and as constables. They are to call for medical assistance if there be any illness on board the barges. The first two cases of cholera did not, however, occur near the river or where the bargemen usually congregate, but in the Noveren district, which is some way inland and close to the railway station. This was on the 26th and 27th of August, so that the cholera took ten days to travel from Antwerp to Boom. Then two bargemen who had caught cholera at Antwerp arrived off Boom and died on board. On the banks of the Roupel, at right angles with the river, are numerous rows of wretched little cottages inhabited by very poor people. These we visited, but more especially one particular row, where fifteen cases of cholera and eight deaths had occurred. In one cottage, inhabited by seven people, four of them had died from cholera. Attempts had been made to disinfect this cottage, but it was in so dilapidated a condition that the sulphur fumes escaped from all sides. The cottage was therefore declared unfit for habitation, and has been closed. It is also proposed to condemn in a similar manner other cottages in the same terrace, which stand back to back, have no through ventilation, and where four other inhabitants have died from cholera. Altogether there had been seventeen deaths from cholera at Boom, counting from Aug. 26th to Sept. 10th.

On visiting the whole of this waterside district the social and sanitary condition appeared so deplorable that it seems almost hopeless to attempt to cope with the approaching epidemic. There are cottages which are actually rented for one franc per week. What sort of accommodation can be expected for £2 2s. per annum? In some cases the condition of these dwellings is so bad that the landlord would be delighted if the sanitary authorities ordered them to be burnt. This, indeed, was about to be done in several instances, when it occurred to the authorities that in such cases the owners of the property would have to be compensated from the public purse. Consequently the places are simply closed by the police and declared unfit for habitation. The owners must then at their own expense render the house fit for habitation before the police will raise their interdiction.

All these cottages have midden closets. For one terrace there was a collective closet consisting of seven seats, side by side in a long passage with one single door, and no division whatever between the seven seats. Men and women of all ages go there together, and there is no sort of privacy. The holes have no covering; they gape over this elongated privy and allow all the foul emanations to freely escape in the air. The Sanitary Commission, in the face of this revolting promiscuity, determined, then and there, to issue instructions to all the householders of the districts ordering them to provide separate closets for each house. Wells are not so numerous here as they are in Antwerp; still there is a well under the row of cottages where eight of the inhabitants have died from cholera. It was curious to note with what reluctance the inhabitants gave any sort of information as to the water they drank. They very unanimously declared that the water of the Roupel made the best coffee, and they showed us the water from the wells; but they so twisted their answers to our questions that there was no finding out which water they had drunk. It seemed as if they thought it a disgrace to drink water, though they would wax eloquent on a particular brew of beer or a special brand of Schiedam. On making further inquiries, I discovered that, after all, it is a sort of disgrace to drink water, for it appears plain water is rarely consumed except to assuage the thirst and fever experienced on the morrow of a drunken bout. And this perhaps also accounts for the fact that a large proportion of the victims of cholera are drunkards. When the system is deranged by alcoholic excesses they will drink on an empty stomach several pints of more or less impure water. It is not surprising that the results should occasionally prove fatal.

Not only old but new cottages have been built at Boom without any sort of regard for the health of the inhabitants. We visited one row of cottages built in a hollow considerably below the level of the road. Behind a portion of these cottages there was a ditch full of foul, stagnant water, which, being deep down, cannot be drained away. Then there rose,

close to the back of the cottages, the high wall of a brick kiln, and against this wall were several closets and middens. Hot, foul steam came up from these cesspits, produced by the heat of the bricks that were baking on the other side of the wall. The cottages thus situated are new, and they stand on refuse which had been thrown into the hollow, but not in sufficient quantity to fill up this hole. The slop water from these cottages cannot possibly drain away; it must sink into the soil or stagnate on the surface.

Boom has a large hospital which was constructed in 1843, and is about as insanitary and unsuitable a building for the purpose as could well be devised. It has huge Gothic windows like those of a church, which, however, cannot be opened. Only at the apex of the Gothic arch is there a small rosace, which, by the skilful pulling of strings, may be partly opened; the ventilation is absolutely insufficient. The cholera patients have not as yet, however, been nursed in this building. They are put in a sort of barn situated in the garden of the hospital. It is a wretched structure, but it has better ventilation. The floor consists of brick tiles placed directly on the earth. Above these are numerous rafters—angles, corners, ledges and places of all sorts where dirt accumulates safe from the reach of broom or duster. The patients have wooden bedsteads and straw mattresses. There is a poverty-stricken, gloomy, grimy look about the whole place which is most dispiriting. Nevertheless, I was assured that the inhabitants of Boom considered themselves very fortunate, for at least they have a hospital, while at Bornheim, for instance, the cholera patients have been put in the schoolroom. It remains to be seen whether parents will very readily send their children to this school when the epidemic is over.

Some remedies for the state of affairs at Boom suggest themselves as effective if properly and strictly carried out. At the end of every terrace leading to the Roupel notices should be posted, if possible, forbidding, in any case, the inhabitants to drink water from the river. Fortunately most of the territory at Boom consists of some two feet of earth, then four to six feet of sand, and after that a thick, impervious layer of clay. Wells in all directions should at once be sunk below the clay strata. If the upper parts of such wells as they go through the earth and sand are carefully cemented, so as to exclude all surface water, it is wellnigh certain that the water taken from below the clay will be pure. This measure will not entail any very great expense and its urgency is undeniable; but it will be no use digging these new and safe wells unless this be followed by the rigorous filling up and closure of all the existing shallow surface and unsafe wells. While this work is proceeding it will also be very useful to condemn as unfit for habitation some of the worst cottages and instruct owners as to necessary improvements. Finally, an order could and ought to be issued forbidding the construction of any new habitations whatsoever without first submitting the plans to a competent sanitary authority.

#### A VISIT TO THE QUARANTINE STATION AT DOËL.

In a Government steamer belonging to the police of the Scheldt and placed at the service of the Scheldt Sanitary Commission I have been able to visit the quarantine station at Doël. This is a small village opposite the Lillo Fort and not far from the Dutch frontier. The journey from Antwerp by steamship takes rather more than an hour. The river at this point is much broader than at Antwerp, and there is plenty of room to anchor a large fleet, even though, according to the existing rule, each ship must keep at a distance of at least 200 metres from her nearest neighbour. There were eleven ships in quarantine when we arrived at Doël. As yet the largest number retained at one and the same time has been seventeen ships. There are military posts on shore to prevent any attempt to land from the ships in quarantine. Anyone convicted of such an attempt may be sentenced to ten years' imprisonment. According to the old law of 1831 the penalty was death. At present all ships coming from infected ports, such as Havre, Hamburg &c., are put in quarantine and kept there till seven days have elapsed since the date of their departure from the infected port. Thus the duration of the journey is counted as forming part of the seven days' quarantine. Dr. Anthoon is in charge of the station at Doël; with one or two exceptions, in which are comprised the Harwich passenger ships, he boards every vessel that passes. According to the newest regulations these ships must show a declaration—signed by the Belgian consul—that there is no cholera in the port whence they sailed. Dr. Anthoon informed me that since the establishment of the

quarantine he had not found a single case of illness on board any one of the ships. Outside Doël and near a fort there is a lazaret where patients from the ships in quarantine are to be taken; but, so far, not a single person has been brought to this place. What is more, among the 2233 inhabitants of Doël there is no illness of any description. "We are taking a holiday," Dr. Anthoon exclaimed.

The ships in quarantine are now being made to empty their supply of drinking water into the river. Perhaps this may further contaminate the Scheldt. On the other hand, the ships themselves run some risk of being contaminated by the water given to them to replace that which they have been compelled to throw away. This water comes from Doël, but there is no water at Doël, except that which is taken from wells, and of course there are cesspools all about the place. To make matters worse, the water for the ships, after it is extracted from the wells, is stored in a reservoir situated close to the cemetery. It is true that at Doel there is no illness, no diarrhoea whatsoever; but how long will such an exceptional state of things continue? There is admirable apparatus at Doël for disinfecting by steam under pressure. There should also be an apparatus for sterilising all water before it is supplied to the ships in quarantine. A very sharp watch, I had occasion to observe, is kept as to the character of the cargo on board the ships, and anything suspicious, such as rags, old paper, old clothes &c., is disinfected at Doël. It is now proposed to place a pontoon on the river, where the disinfecting operations will be carried out, and thus the trouble and risk of landing the articles will be avoided. According to the last news there have been 103 cases of cholera treated at the Antwerp Hospital, to say nothing of the cases that were not removed to the hospital. In witnessing the strict measures of quarantine imposed at Doël I could not help thinking that the authorities are to be congratulated on the very elaborate bolts and bars they have affixed to the stable door after the horse was stolen. But I will not discuss in this place the vexed question of quarantine, my object at present being merely to relate what I have seen; and at Doël, it must be confessed, there is very little to see. In spite of the pleasant breeze, the inspiring journey on the broad river, the amiable hospitality of the members of the Scheldt Sanitary Commission, who had constituted me their guest, it was difficult not to feel a little depressed at the sight of so many fine-ships lying idle while their healthy crews are compelled to drink the well water of Doël.

#### ALLEGED PROPHYLACTIC VALUE OF RHINE WINES.

The *Rheinische Kurier* for Sept. 7th draws attention to the fact that cholera has never occurred in the Rheingau, the heart of the wine district, where some of the most famous vintages occur, and where the "wine of the country" is the common beverage. From this fact, and also the good reputation which these wines enjoy among local medical men in treatment of gastro-intestinal disorders, the inference is drawn that the better classes of white Rhine wine may with advantage be prescribed for cholera patients.

#### BACTERIOLOGICAL DIAGNOSIS OF CHOLERA.

A demonstration on the bacteriological diagnosis of cholera was lately given before the Berlin Medical Society by Dr. R. Pfeiffer (*Deutsch. Med. Wochensh.*, Sept. 8th), who urged the systematic microscopical examination of the dejecta, which in certain cases is quite sufficient to establish the diagnosis, when the comma bacilli occur in an almost pure culture and form characteristic masses in flakes of mucus. In cases of doubt gelatine plate cultures must be made to decide the question. The methods thereby necessary to absolutely determine diagnosis occupy from twenty-four to thirty-six hours.

#### INTRA-ARTERIAL INJECTION OF SALINE FLUIDS.

Dr. Oscar Silbermann (*Deutsch. Med. Wochensh.*, Sept. 8th), whilst recognising the value of subcutaneous and intravenous injection of saline fluids in cholera, points out that owing to stagnation of the thickened blood in the venous system it may be far better sometimes to inject the fluid into the arterial system in a manner similar to the form of arterial transfusion introduced by Landois and Ungar. The radial artery is laid bare for a short distance, the peripheral end of the exposed vessel secured by a ligature and the central by forceps. The apparatus consists of a funnel-shaped receiver of 500 to 600 cubic centimetres capacity, terminating in a

T-shaped tube with which is connected a syringe, the vertical limb being attached to the rubber tube, which ends in the nozzle that is subsequently inserted into the artery above the point of ligation. This insertion does not take place until the tube and syringe have been filled with the fluid and all air driven out. The fluid is then pumped into the artery towards the heart by means of the syringe, and the process of filling the syringe and repeating the injection is readily effected without any risk.

#### INJECTIONS INTO THE URINARY BLADDER.

Dr. Carl Barth (*Deutsch. Med. Wochensh.*, Sept. 8th) suggests that the absorbent surface of the mucous membrane of the bladder should be utilised for the introduction of water into the cholera organism. He thinks the scanty concentrated urine found in the bladder after death in cholera seems to indicate the reabsorption of urinary water under the influence of the increased density of the blood in the vessels. Copious injections of saline fluid into this viscus may therefore fulfil the main indication of the choleraic state.

### THE SANITARY CONGRESS.

THE thirteenth annual Congress of the Sanitary Institute opened at Portsmouth on Monday, the 12th inst., with a reception held by the mayor (Alderman T. Scott Foster) at the Town Hall. After the reception luncheon was partaken of in the banqueting hall, the mayor presiding. The usual loyal toasts were given and the mayor then proposed "Success to the Sanitary Congress," offering in a few well-chosen words a cordial welcome to the members. Sir Thomas Crawford and Sir Charles Cameron responded.

#### THE PRESIDENT'S ADDRESS.

The luncheon concluded, the guests went into the large hall to hear the presidential address. Sir Thomas Crawford having vacated the chair, Sir Charles Cameron, the president of the Congress, delivered the inaugural address on the Victorian Era the Age of Sanitation. He said that the Sovereigns of many countries had been made famous by wars, by political and religious revolutions, and by the works of intellectual giants such as Shakespeare, Bacon and Newton; but the Victorian era was the age of sanitary and social reforms—of diminished sickness, of increased longevity. Never had the British people been so free, so happy, so rich, so powerful, so educated, so moral, so philanthropic, so healthy as during the Victorian era. From the earliest ages, since the people of these islands emerged from barbarism, some attention had been given to the subject of public health, and a few enactments, more or less relating to the health of the people, might be found on the Parliamentary Statute-books and amongst the edicts of the Sovereigns previous to the nineteenth century. Their provisions were, however, rarely enforced, and if all the Sanitary Acts passed before her Majesty's reign were collected they would form a volume of no great size. The Victorian era had produced a wealth of legislation and literature on the subject. The higher estimation of preventive medicine now prevailing among medical men was shown by the recent institution of degrees, diplomas and certificates in public health, State medicine and sanitary science by the universities and medical and surgical corporations. Before the Victorian era there were few sanitary laws worth administering, and consequently no *raison d'être* for local boards or officers of health. Some drainage works had been carried out by the town and country authorities, and a few attempts were made to improve the water-supplies of urban districts. On the other hand, people were taught to be too economical in the combustion of fuel by the imposition of a rate on hearths, and they were encouraged to exclude daylight by having to pay a window tax. The insanitary state of British towns was made painfully evident by the invasion of cholera in 1831. According to official statistics there died from cholera in 1831-2 31,376 persons in England and Wales and 21,171 in Ireland. In 1848 cholera reappeared in England and Wales and destroyed 53,273 lives. In 1853 20,097 deaths were ascribed to cholera, of which about one-half occurred in London. In 1866 it reappeared, but with less fatal results. The deaths in England attributed to it were 14,378, in Ireland 2501, and in Scotland 1470—total, 18,149. This

lessened mortality was not due to the milder character of the disease, but rather to the towns being less filthy than they were during previous visitations. On the Continent so virulent and widespread was cholera at this time that it was computed to have caused more than 1,000,000 deaths. A committee appointed to inquire into the sanitary condition of the metropolis reported in 1848 that no substantial improvement had taken place in the state of the back streets, lanes, alleys and courts since the cholera epidemic of 1831-2. The committee expressed an opinion that if the disease was again to visit London it would spread as extensively and prove as fatal as it did in the former visitation. This prediction was unfortunately but too soon verified; but in the meantime the era of sanitary activity was initiated by the passing of the Public Health Act of 1848. Sir Charles Cameron said that although the administration of sanitary laws involved a great outlay of money, it was money well expended. He dwelt upon the necessity of a high standard of efficiency for a medical officer of health, and maintained that that officer would in the future be something more than a physician and a surgeon; he would be, in a sufficient degree, a bacteriologist, a chemist, a veterinarian, a geologist, an engineer, a statistician and, so far as the sanitary statutes were concerned, a lawyer. The Sanitary Institute never did a better thing than issuing their certificate for inspectors of nuisances and for local surveyors. Since 1877 no fewer than 1312 candidates for the sanitary certificate had been examined, of whom 825, or 63 per cent., were successful. During the same period 78 local surveyors received certificates and 113 were unsuccessful. During the Victorian age many millions of money had been spent on sanitary works, and not only did he think the results had been to satisfy the public that there was no waste of public money, but that they were justified in increasing their exertions. Some money might have been injudiciously laid out, but the same might be said of the expenditure for most other public purposes. "Moreover," he said, "it must be admitted that the provisions of many of the Acts relating to health have not been fully carried out, and that many local sanitary authorities, especially in rural districts, have lamentably failed to perform the duties, whether permissive or mandatory, entrusted to them by Parliament. It would not be difficult to discover places where the sanitary statutes are almost or wholly dead letters. They would, indeed, be dead letters in more places than they are were it not for the powerful influence exercised upon public opinion and on the conduct of the authorities by such organisations as the Sanitary Institute, and by the pen and voice of earnest sanitarians. There are hundreds of towns and villages in these islands which are still unprovided with proper arrangements for drainage and filth disposal, and which are dependent upon scanty supplies of water, often of bad or inferior quality. On the whole, however, it must be admitted that the sanitary powers confided to the local authorities have been largely put in force." In comparing the present sanitary state and death-rate of the United Kingdom with the last century and the early part of the present one the President said, the frightful mortality of London and other cities in the last century was due to insanitary conditions. By the earlier part of the nineteenth century the grosser defects had been remedied and the death-rate had been greatly reduced. For about half a century no further improvement took place, but with the passing of the Public Health Acts of 1872 and 1875 an era of active sanitation ensued, with the result that the death-rate fell sensibly in nearly all the towns, and great reductions had been shown in Scotland and Ireland, which were all the more remarkable considering the increasing density of population. Large and dense populations were, as a rule, more unhealthy than small and widely scattered ones. In London the unfavourable influence of the closer approximation of its inhabitants was much more than compensated for by the great improvements effected in the general hygienic conditions of the City. In every other large country in the world the rural population greatly exceeded the urban. In England it was the reverse; 10½ out of its 25 millions lived in the big towns. It was surprising that under such conditions the whole population of England had a greater longevity than the French, German, Russian, Italian and Spanish. Referring to the department of State medicine, he remarked on the importance and utility of vital and moral statistics and advocated a triennial census. The recent reduction of the death-rate was most marked in the case of infective diseases, of which phthisis was the most fatal. We should not be discouraged because of Koch's failure to kill the bacillus of tuberculosis;

in time we should be able to control its ravages and perhaps to extirpate it altogether. In conclusion Sir Charles Cameron said: "The high mortality of the working classes is in no considerable degree due to the insanitary dwellings in which a large proportion of them reside. It is to the improvement of the homes of the artisans and labourers that we must chiefly look for a further reduction in the death-rate of towns. It is not sufficient, therefore, to have our own houses in good order, we are interested, though of course not to the same extent, in having all the houses in our neighbourhood placed under healthful conditions. The education of the people in sanitation ought not to be confined to limited sections of society, but should be carried out as one complete and well-graduated system for the instruction of the whole nation. A study of the laws of health should form part of the system of primary education, and would be at least as interesting to the youthful mind as a study of the 'three R's.' The character and conduct of the man are mainly dependent upon the education and training of the child; so also in the future nation its action and progress will be the product of the education given to the actual nation in its infancy and youth. Not a few of the evils arise from systematic violations of the laws of life and health. We can hardly be clean in our minds if we are foul in our bodies. Let us keep corruption as far from us as possible; let us dwell in the freshness of things and remember always that filth is synonymous with disease and death; let us worship at the shrine of that goddess who has given a name to the noblest of the sciences—that which relates to the preservation and improvement of that precious porcelain of man's body."

#### SECTIONAL PROCEEDINGS.

On Tuesday Prof. Kelly read a paper on the Census. He recommended that a count of the population should be taken quinquennially. Dr. J. Groves next read a paper on Isolation Hospitals. Drs. Blackman and Parkes took part in the ensuing discussion, a resolution by the latter gentleman, to the effect "That the Sanitary Institute be recommended to ask the Local Government Board to allow a special expenditure for cholera precautions and hospitals, and that such expenditure should come out of the Imperial and not out of the local rates," being unanimously carried.

Mr. A. E. Harris (Islington) discussed the question, Should Phthisis be compulsorily reported? In the afternoon a paper was read by Dr. Newsholme on Condemnation of Meat of Tuberculous Animals. A resolution recommending that where a portion of an animal was affected with disease the whole carcass should be condemned was unanimously carried. The Purification of River Water by means of Iron was the next subject discussed, Mr. H. Swete read a paper and presided over the meeting. Mr. G. H. D'earth read a concluding paper on the subject of Village Sanitation.

At the Conference of Sanitary Inspectors Professor A. Wynter Blyth, the President, remarked that the Sanitary Institute had at length attained its proper position and was confessedly the chief society in the kingdom, having for its main object the furtherance of all knowledge relating to the prevention of disease.

"Difficulties in the Prevention of Infectious Diseases" was the title of a paper read by Mr. S. C. G. Fairchild of Clapham, who said that the section of the Infectious Disease Notification Act dealing with the notification of infectious disease by the head of the family was seldom carried out in many districts, and thereby loss of time took place before any steps could be taken by the sanitary authority.

Mr. W. J. Addiscott moved: "That this meeting is of opinion that the removal to an isolation hospital of all persons, irrespective of social status, who are not, in the opinion of the sanitary officers, effectually isolated should be made compulsory." Mr. Fairchild seconded the resolution, which was supported by the President. The resolution was passed unanimously.

Mr. W. H. Wells (Newcastle-on-Tyne) read a paper entitled "The Sanitary Institute and its relation to Sanitary Inspectors," and moved a resolution which had for its object an alteration in the existing examinations of the Institute. The resolution was then put to the meeting, but the majority voted against it, the general opinion being that it was neither wise nor necessary to interfere with the operations of the Institute, whose examinations, according to several speakers, became more stringent year after year.

#### THE LADIES' CONFERENCE.

A Ladies' Conference was held in the grand jury room at the Town Hall. Sir Charles Cameron welcomed the ladies as

coadjutors in the work of the Institute, and then, apologising briefly for the unavoidable absence of the President (Lady Douglas Galton), introduced Mrs. Ernest Day as President of the Conference. Dr. J. P. Williams-Freeman delivered an address on the Chief Hygienic Causes of Mortality amongst Infants and Young Children.

#### MILITARY HYGIENE.

In the Aula Magna of the Roman Catholic Cathedral, Edinburgh-road, Landport, a conference of naval and military hygienists was held, under the presidency of Inspector-General John D. Macdonald, who, in an introductory address, dealt at some length with the question of typhoid fever and other bacteria, illustrating his subject by means of a number of interesting diagrams. Surgeon-Captain R. H. Firth, A.M.S., Assistant Professor of Military Hygiene at Netley, then read a paper on some Sources of Danger to the Public Health in Indian Methods of Conservancy, especially with reference to the Prevalence of Zymotic Disease in that Country. Following this came a paper on the Prevalence of Common Diseases at Home and Abroad, by Dr. Richard Domenichetti, Deputy Inspector-General and Medical Officer of Health Louth Combined Districts.

#### VISIT TO EASTNEY.

At the conclusion of the conferences a number of waggettes were in readiness at the Town Hall, and nearly 200 members visited the pumping station and subterranean sewage tanks at Eastney. The sewage undergoes no treatment whatever. It is raised from the sewers into three large tanks capable of holding about 6,000,000 gallons, and from these it is discharged twice a day into the sea at Eastney. One of the reservoirs was effectively illuminated with coloured lamps. The party then proceeded to the borough asylum, where the Committee of Visitors, of which Sir W. King is president, entertained them in the large recreation-room with music and a "high tea." In proposing the health of Sir W. King Sir C. Cameron thanked him and the members of the Visiting Committee for the hospitality which had been shown to the members of the Congress. As the weather was most propitious and the arrangements perfect the excursion proved a most enjoyable one.

#### ENGLISH HOMES.

In the evening Sir Thomas Crawford, K.C.B. &c., gave a lecture at the Town Hall on English Homes. Dealing with the necessities for a healthy home he said the first requisite was a free supply of fresh air. Sunlight, too, and pure water were prime necessities of life. As a remedy for impure water he recommended that in poor localities the water-supply should be the landlord's responsibility, and his power to recover rent should be conditional on the efficiency and sufficiency of the supply of water. Sir Thomas Crawford next dealt at length with the question of air space and ventilation, and, referring to the danger to health caused by the combustion of gas, said that, fortunately for those who could afford it, there was a near prospect of relief in the electric light. He recommended a limited use of curtains and carpets, which were often the happy hunting ground of the hostile microbe. Of furniture in general it might be said that the safest limit was the utilitarian one, and in bedrooms the more Spartan the taste the better. Alluding to rural homes he showed the economic as well as sanitary advantage of having the allotments surrounding the cottages, but said that the change would not come until the landed proprietors saw the folly of letting land only under conditions which made agricultural pursuits unremunerative. "General" Booth's scheme had the advantage of attempting to place the unemployed on the soil under conditions which promised the industrious cultivator health, food and clothing, with a reasonable prospect of a useful life. But why not begin at the other end of the problem and deal with the agricultural labourer before he left the land to become a town loafer suitable only for Salvation Army purposes? In conclusion, Sir Thomas Crawford said: "The housing of the working classes is in a fair way of being satisfactorily provided for, but nothing has yet been done to provide suitable accommodation for the poorest class of the people not actually paupers."

#### CHOLERA, TUBERCULOSIS, SMALL-POX.

On Wednesday Sir C. Cameron opened the section of Sanitary Science and Preventive Medicine by introducing the President, Professor L. Notter, M.D., who, he said, was a fellow countryman of his, a graduate of Dublin and one of the first who took the public health diploma at that

University. After the reading of the address Sir C. Cameron proposed a vote of thanks to the President, who said he had admirably summarised our knowledge "up to date." Sir T. Crawford seconded, and it was carried with acclamation.

Mr. F. Oldfield followed with a paper on Tuberculosis; or, Does Consumption arise from Flesh Eating? Sir C. Cameron said the paper was really a lecture on Vegetarianism, and pointed out that animals such as cows, which were strictly vegetarians, suffered most severely from tuberculous diseases. He also added that we might as logically cease to drink water because it occasionally induces cholera or typhoid fever. The Irish poor, who eat very little meat, suffer greatly from phthisis, whilst the rich, who consume animal food largely, do not suffer nearly to the same extent. He advocated the abolition of private slaughter-houses and more efficient supervision of public ones. Mr. Washington Lyon described what is done in the London abattoirs. Dr. Armand Ruffer said, as the result of post-mortem examinations of over 1000 cases in adults in not five cases had he been able to say that the disease was due to the ingestion of the bacilli into the alimentary tract. In children the contrary is the case, and yet they eat little or no meat, but, on the other hand, they are large consumers of milk. The danger from eating meat is very slight, but the danger to children drinking milk of tuberculous animals is very great. The poisonous products of the bacilli when taken into the stomach are practically inert. Even tuberculous meat when properly cooked is free from danger. Where one person dies from ingestion of meat a hundred are directly infected from their relatives or friends. Sir T. Crawford concurred entirely with Dr. Ruffer's observations and emphasised the great importance of an abundance of fresh air as shown by the army returns. Dr. Sykes and Dr. Thresh having also spoken, Mr. Oldfield replied, insisting upon "flesh food" being a more important cause of tuberculosis than was usually supposed, and that as it was often impossible to detect bacilli in flesh, it was best to desist from eating all flesh. The views of the writer did not appear to meet with the support of any medical member of the Congress present. The Chairman suggested, and Mr. Oldfield proposed, that "in the opinion of this meeting the total abolition of private slaughter-houses in towns is an urgent necessity." This was duly seconded and carried *nem. con.*

Captain F. Smith then read his paper on How long does Vaccination confer Immunity from Small-pox? Dr. Sykes thought the public might infer from the paper that because a person could be re inoculated in a few months after vaccination, he therefore was again susceptible and that vaccination affords only a very brief protection. This is a fallacy, as proved by the statistics of every epidemic which had been carefully investigated. Small-pox is not naturally acquired by inoculation, therefore it did not follow that because a person could be revaccinated at such an early period he was susceptible to the disease from ordinary exposure to infection.

Mr. Washington Lyon moved that "The execution of the Vaccination Acts be transferred from the Board of Guardians to the sanitary authorities." This was carried unanimously.

#### MORTALITY OF CHILDREN IN DUBLIN.

Sir C. Cameron, after luncheon, read his paper on the Mortality of Children in Dublin. Dr. Sykes said the adult mortality in Dublin being high, the infantile mortality by comparison was low, but if calculated upon the basis of age-population probably the result would be different. Mr. Kemble pointed out the effect of social position—the lower the social status of the population the higher the infantile mortality, and *vice versa*. Sir T. Crawford regarded the improper feeding of children as one of the greatest, if not the greatest cause of the excessive mortality amongst children, and referred to the habit of Irish mothers sleeping with children in their arms as an objectionable one. Mr. Trevor Fowler (Epping) dwelt upon the difficulty of obtaining milk in many rural districts, especially in the neighbourhood of large cities. In replying, Sir C. Cameron said he had given statistics on various bases and contended that he had proved that in Dublin children under one year of age had a better chance of life than in any other large town with which he was acquainted. There being few factories in that city a much larger proportion of Irish mothers nursed their own children.

#### DISPOSAL OF THE DEAD.

In the absence of the Rev. F. Laurence the secretary read his paper on the Disposal of the Dead, advocating the

system of earth-to-earth burial. Sir C. Cameron did not regard the burying of bodies in the earth as likely to be a cause of nuisance or injurious to health, whether in well-conducted cemeteries near towns or in village churchyards. He had never detected any vitiation of the air in burial grounds, and he had found very little organic matter in the water drained from cemeteries. Dr. W. Cousins contended that since many diseases were due to specific microbes, and since these could possibly multiply in the earth and ultimately become disseminated, earth-to-earth burial was not so safe as other methods of disposing of the human body which have been suggested. Dr. Axford dwelt on the difficulty and cost of obtaining suitable land for cemeteries as at Portsmouth. Such land would be unnecessary were cremation adopted, and could be used for other and better purposes. He advocated the greater care in the filling in of death certificates. Cremation he regarded as a more natural sanitary method of disposing of the dead. Sir T. Crawford said in Benares cremation did not decrease the risk from cholera. The Moslems bury one body in one grave, and he had never known disease to be spread through the graveyards. He did not think there was any danger of buried infected bodies disseminating disease. Dr. Notter drew attention to the fact of there being earth which could not be considered "living earth," and that too dry, sandy soils were unsuitable for human burial since they were almost destitute of micro-organisms.

Dr. Warner being absent, Dr. Sykes read his paper on the Physical Condition of Children.

#### VISIT TO WATERWORKS.

Many of the members during the afternoon visited Porchester Castle; others at the conclusion of the meeting took train for Havant, where carriages were in waiting to drive them to the Portsmouth Water Company's works. At Havant, and at Bedhampton close by, a number of springs in the chalk supply the whole of the borough and the dockyard. The group of springs at Havant rise into shallow reservoirs covering some three or four acres. At Bedhampton there are also several springs, one of which, the "blue hole"—so called on account of the beautiful tint of the water—yields from two to three million gallons of water per diem. The pumps at the two stations raise on an average five and a half million gallons of water daily into a reservoir of from 7,000,000 to 8,000,000 gallons capacity, situated on Portsdown Hill, some three miles nearer the town, from which it flows by gravitation to supply a population of about 160,000. This gives 34 gallons per head per diem. Portsmouth is a water-closeted town, the number of closets being 44,000. From Portsdown the water passes through four mains of 10 in., 12 in., 20 in. and 24 in. diameter respectively to supply the town. There is also an extra 12 in. main which supplies the dockyard only. All the above mains are laid in duplicate. The supply is constant. The estimated cost of the works is £400,000 and the company pays the maximum dividend of 10 per cent. The Corporation have contemplated the purchase of the works, for which the company ask £1,100,000. Colonel Owen, the vice-chairman of the company, and Mr. R. W. Ford, the secretary, conducted the visitors over the works and gave the fullest possible information. Refreshments had also been thoughtfully provided at the Bedhampton works. The members thanked Colonel Owen and Mr. Ford for their kindness and returned to Portsmouth in time for the Mayor's reception and conversation.

## HOUSE SANITATION IN HEALTH RESORTS.

BY A. P. SHERBOURNE, M.D., L.R.C.P.  
(EASTBOURNE.)

WITH the exception of a pure water-supply there is no condition of more importance to the health of a community than the state of its house sanitation; and in towns where speculative building is the rule rather than the exception it becomes a very anxious and difficult task for the sanitary authority to secure such a state of perfection as modern science has proved to be necessary. Even the provisions of the Public Health Act or of Local Improvement Acts are very difficult to enforce without arousing a great deal of bitter personal animosity, and the natural reluctance of town councillors to put

the law in force against a fellow townsman—not infrequently a member of the corporation—leads them to put off the unpleasant duty until faulty materials and workmanship have become largely used, and the officials, disheartened by the disregard of their reports, cease to make them, and interested parties carry on their work unchecked. But in health resorts, where the competition between lodging-house keepers and persons who sublet their furnished houses is so keen, there is always a desire to show a good sanitary condition, and this, if taken advantage of by the sanitary committee, can be used as a powerful lever and a vast amount of sanitary work accomplished without exciting any personal animosity and without putting the provisions of the law in force. In this way not only can the old bad work be replaced by good, but builders know that their work will be tested and so a good condition of all new houses is secured.

By establishing a voluntary register of sanitary houses the Corporation of Eastbourne has made an attempt to take advantage of this competition between the lodging-houses, and the scheme has met with such a measure of success as to prove that there is a desire on the part of willing owners to have their property made sanitariously sound, whilst the unwilling follow their example in their own interest. The system as carried out at Eastbourne is entirely voluntary, and no house can be registered, and no certificate is given, till every requirement is strictly complied with. This presses sometimes very hardly upon the owners of old houses, but if any departure were allowed from the standard fixed upon the certificates would inevitably lose their value, and it has been found that ingenuity can overcome obstacles at first almost insuperable when the owner sincerely desires to improve his property.

The register contains a full description of the sanitary appliances in each house, the position and fall of the drain, a description of the watercloset, sinks, dustbins and water-supply, with the names of the builder, owner and occupier. It forms a useful book of reference both for officials and owners. The register is not signed till everything is perfect, and until it is thus signed by the examining inspector no certificate is given. The certificate is not a vague one, leaving room for opinion as to what is or is not sanitary, but sets forth certain requirements which the examining inspector has to certify are duly complied with. This saves the inspectors from much badgering, gives them a definite responsibility and renders their work more easily supervised. Moreover, the corporation is protected against extravagant expectations, as anyone reading the certificate can see how far it goes. The certificate as at present issued does not give quite all the requirements which are insisted upon, but a new issue will have them set forth. It runs as follows :

I HEREBY CERTIFY that on the ... day of ... 189, the above-named premises were duly and properly examined and inspected and the drains tested, when it was found that the undermentioned requirements were duly complied with.

Dated this ... day of ... 189 .

#### REQUIREMENTS.

1. There must be an efficient intercepting trap between the house drains and the sewer.
2. All the drains must answer any test applied by the examining inspector.
3. All openings in the drains must be outside the house and properly trapped.
4. All waterclosets must be of good pattern, with separate water-supply, sufficient flush and the soil pipe efficiently ventilated.
5. A separate water-supply for drinking purposes.
6. A properly covered or removable dustbin.

.....  
Chief Inspector of Nuisances.

N.B.—This certificate will be withdrawn if, at any time, the sanitary arrangements are found in a faulty condition or badly kept, or any alterations are made without the approval of the inspector of nuisances.

The further requirements are : under (1) an easily accessible means of inspection ; under (2) efficient ventilation of the drain by inlet and separate up-shaft if the soil pipe is not at its highest point ; under (3) all "wastes" must be trapped as well as disconnected ; under (4) soil-pipe carried up full-bore well above the eaves and away from windows. "Pan" and "long hopper" waterclosets and bell traps are not passed and the drains must stand the water test below the ground and the smoke above. The inspection is made, advice given and the tests applied free of cost to the applicant for a certificate, but all work is done at his expense by workmen employed by him, and it must be done to the satisfaction of the buildings' surveyor, medical officer of health, and the inspector who signs the register.

The system is new as yet and will no doubt be modified

and improved as time goes on ; but it has passed through a storm of opposition, stirred up by the interested and fomented by the timid, and now the demand for certificates is so steady that its usefulness will soon be unquestioned. The first certificate was issued in the spring of 1890, and by the end of that year only fifty-six had been granted ; the number, however, has now reached 225, and there have been for some time about eight new houses certified every month. The number at present issued forms about 15 per cent. of the whole number of houses concerned—viz., lodging-houses, schools, hotels and private houses of a rental above £50 per annum. Although the great bulk of the cottage property and most of the private residences could easily obtain certificates it is found that the owners do not apply for them. As to the future, the council cannot now withdraw from the good work it has commenced. Visitors are beginning to require certificates before taking houses, and a house agent bitterly complains that the sanitary committee is "ruining the town" in consequence. It is easy to prophesy therefore that the ruin will be averted and owners find the value of their property increased, whilst the reputation of Eastbourne as a safe health resort and place of residence cannot fail to be enhanced.

## CONGRESS OF OBSTETRICS AND GYNÆCOLOGY AT BRUSSELS.

(FROM A CORRESPONDENT.)

IN spite of adverse circumstances, I presented myself at Dr. Jacobs' clinique, where Dr. Segoud of Paris was to operate at 8 o'clock. Dr. Jacobs' hospital is situate quite on the confines of the city, almost in the country. There were about sixty present at the operation, of whom only about a dozen were able to see anything. The room was not very light ; perhaps the crowd obscured it. The case operated upon was one where a pyo-salpinx or ovarian abscess was diagnosed behind the uterus. Dr. Segoud, in his observations before the operation, insisted that a vaginal operation was better than abdominal section, safer and more easily carried out. The operation was the removal of the uterus per vaginam *morellement* in order to cure inflammations of the appendages. He cut round the mucous membrane front and back, pulled down the uterus and snipped off pieces as he went on, stripping off the peritoneum until he finally shelled out the whole uterus ; he then opened the abscess behind the uterus, evacuated the pus and washed out the cavity. Fourteen pairs of forceps were left on the various bleeding points, with their handles variously gilt, so as to be the more easily recognised. Two sponges dipped in iodoform were placed one in front and the other behind the bundle of forceps to sustain the vaginal and peritoneal wall and to prevent subsidence of the intestines. To many of us the operation seemed a roundabout way of doing what English operators prefer doing by abdominal section. We prefer the short and direct way of getting at the diseased ovaries and tubes and the resulting abscesses, and have as yet had no experience of removing the uterus in order to cut off the source of infection. I have just heard that in this particular case the disease was set up by gonorrhœa, and so, the uterus being itself also diseased, there was perhaps some *primâ facie* reason for this method of procedure. There will, however, be a discussion on the subject during the Congress.

At 2 P.M., or rather 2.30, Dr. Kuffrath, the President, opened the session in the absence of the King. The King, however, intends to be present at the meeting to-morrow (Thursday) afternoon, and afterwards, at 3.30, is going to receive all the members of the Congress at the Palace. All the delegates were in full—i.e., evening—dress.

After the President had sat down he called on Dr. C. Jacobs, the general secretary, to speak. He gave a short account of the initiation of the movement by the Société Belge de Gynécologie et d'Obstétrique, and gave a list of the cognate societies that had sent delegates to the Congress, heading the list of thirteen with the British Gynæcological Society. He also referred to the gracious act of the King, who had accepted the position of patron, to M. de Bruyn, Minister of Public Works, Industry and Agriculture, and to the Minister of Railways, who had carried all exhibits for half price (a hint for our own railway companies under similar circum-

stances). Then ensued a list of speeches by the various delegates, beginning with Spencer Wells, representing England; then Engelmann, from the States; Gusserow, Berlin; Péan, Paris; Engstrom, Finland; Consolas, Athens; Porro, Milan; Schonberg, Christiania; Rein of Kiev, Russia; Vuillet of Geneva, Switzerland; a representative from Turkey; More Madden (who spoke in French), Ireland; and Murdoch Cameron of Glasgow, Scotland.

The President then declared the session opened and read a short paper on Puerperal Fever, showing that since the introduction of antiseptics into the Maternity Hospital the mortality had most remarkably decreased. The report of the rest of this Congress, which promises to prove an interesting one, I must defer till next week.

Sept. 14th.

## VITAL STATISTICS.

### HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 6398 births and 3688 deaths were registered during the week ending Sept. 10th. The annual rate of mortality in these towns, which had increased in the preceding three weeks from 18.0 to 19.8 per 1000, declined last week to 18.9. In London the rate did not exceed 16.6 per 1000, while in the thirty-two provincial towns it averaged 20.5 per 1000. The lowest rates in these towns were 10.2 in Norwich, 11.3 in Croydon, 13.9 in Birkenhead and 14.3 in Nottingham; the highest rates were 24.7 in Blackburn, 26.5 in Leeds and in Salford, 28.8 in Burnley and 31.6 in Preston. The 3688 deaths included 899 which were referred to the principal zymotic diseases, against numbers increasing from 678 to 984 in the preceding three weeks; of these, 652 resulted from diarrhoea, 62 from scarlet fever, 59 from diphtheria, 54 from measles, 39 from whooping-cough, 30 from "fever" (principally enteric) and 3 from small-pox. The lowest death-rates from these diseases were recorded in Norwich, Plymouth, Birkenhead and Huddersfield, and the highest rates in Blackburn, Gateshead, Sheffield, Leeds and Preston. Measles caused the highest proportional fatality in Huddersfield, Brighton and Oldham; scarlet fever in Leeds and Swansea; whooping-cough in Derby and Preston; "fever" in Blackburn; and diarrhoea in Leicester, Salford, Hull, Bolton, Sheffield, Gateshead, Leeds and Preston. The 59 deaths from diphtheria included 37 in London, 4 in Liverpool, 4 in Birmingham and 3 in Leeds. Three fatal cases of small-pox were recorded in Halifax, but not one in London or in any other of the thirty-three large towns. Four cases of this disease were under treatment in the Metropolitan Asylum Hospitals and 3 in the Highgate Small-pox Hospital on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 3339, against 3052, 3103 and 3280 on the preceding three Saturdays; 414 new cases were admitted during the week, against 367 and 461 in the preceding two weeks. The deaths referred to diseases of the respiratory organs in London, which had been 148 and 114 in the preceding two weeks, rose to 125 last week, but were 40 below the corrected average. The causes of 64, or 1.7 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Brighton, Cardiff, Nottingham, Salford, Sunderland and in ten other smaller towns; the largest proportions of uncertified deaths were registered in West Ham, Birmingham, Leicester, Blackburn and Huddersfield.

### HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had declined in the preceding three weeks from 17.2 to 15.7 per 1000, rose again to 16.6 during the week ending Sept. 10th, but was 2.3 per 1000 below the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 9.4 in Aberdeen and 16.1 in Edinburgh and in Paisley to 18.9 in Perth and 22.3 in Greenock. The 461 deaths in these towns included 24 which were referred to diarrhoea, 10 to scarlet fever, 9 to whooping-cough, 6 to measles, 6 to diphtheria, 6 to "fever," and not one to small-pox. In all, 61 deaths resulted from these principal zymotic diseases, against numbers declining from 81 to 67 in the preceding three

weeks. These 61 deaths were equal to an annual rate of 2.2 per 1000, which was 2.4 below the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of diarrhoea, which had been 34 and 26 in the preceding two weeks, further declined to 24 last week, of which 12 occurred in Glasgow and 4 in Edinburgh. The deaths referred to scarlet fever, which had been 10 and 14 in the preceding two weeks, declined again to 10 last week, all of which were recorded in Glasgow. The 9 fatal cases of whooping-cough were within 1 of the number in the previous week and included 7 in Glasgow. The deaths from diphtheria, which had been 4 in each of the preceding two weeks, increased to 6 last week, of which 3 occurred in Glasgow and 2 in Aberdeen. The 6 fatal cases of measles showed a further decline from those recorded in recent weeks, and included 4 in Edinburgh. Of the 6 deaths referred to the different forms of "fever," 3 occurred in Dundee and 2 in Glasgow. The deaths referred to diseases of the respiratory organs in these towns, which had been 57 in each of the preceding two weeks, were 59 last week, and within 3 of the number in the corresponding week of last year. The causes of 50, or nearly 11 per cent., of the deaths in the city last week were not certified.

### HEALTH OF DUBLIN.

The death-rate in Dublin, which had increased from 19.5 to 26.3 per 1000 in the preceding three weeks, further rose to 28.3 during the week ending Sept. 10th. During the first ten weeks of the current quarter the death-rate in the city averaged 23.5 per 1000 against 17.5 in London and 16.1 in Edinburgh. The 190 deaths in Dublin during the week under notice showed an increase of 14 upon the number in the preceding week, and included 28 which were referred to diarrhoea, 4 to "fever," 3 to measles, 1 to whooping-cough, and not one either to small-pox, scarlet fever or diphtheria. In all, 36 deaths resulted from these principal zymotic diseases, equal to an annual rate of 5.4 per 1000, the zymotic death-rate during the same period being 3.2 in London and 2.0 in Edinburgh. The fatal cases of diarrhoea, which had been 9 and 19 in the preceding two weeks, further rose to 28 last week. The deaths referred to different forms of "fever," which had been 2 in each of the preceding three weeks, increased to 4 last week. The fatal cases of measles, which had steadily declined in the previous six weeks from 8 to 1, rose again to 3 last week. The 190 deaths registered in Dublin last week included 75 of infants under one year of age and 29 of persons aged upwards of sixty years; the deaths of infants showed a considerable further increase upon those recorded in recent weeks, while those of elderly persons showed a slight decline. Seven inquest cases and 4 deaths from violence were registered; and 46, or nearly a fourth, of the deaths occurred in public institutions. The causes of 35, or more than 18 per cent., of the deaths in the city last week were not certified.

### VITAL STATISTICS OF LONDON DURING AUGUST, 1892.

In the accompanying table will be found summarised complete statistics relating to sickness and mortality during the month of August in each of the forty-one sanitary districts of London. With regard to the notified cases of infectious disease in London during last month, it appears that the number of persons reported to be suffering from one or other of the ten diseases specified in the accompanying table was equal to 12.5 per 1000 of the population, estimated at 4,263,294 persons in the middle of this year. Owing to the increasing prevalence of scarlet fever in the metropolis this rate shows a slight further increase upon those recorded in the preceding six months, which had steadily risen from 5.1 to 12.2 per 1000. Among the various sanitary districts the rates last month were considerably below the average in Paddington, Kensington, St Giles, Strand, St. Olavo Southwark, Wandsworth and Lewisham; while they showed the largest excess in Holborn, Newington, Bermondsey, Plumstead and in all the districts of East London. The prevalence of small-pox in London showed a further decline during August, an average of 4 cases weekly being notified, against 27 in May, 16 in June, and 5 in July; of the 19 cases notified last month 3 belonged to St. Pancras, 3 to Mile-end Old Town, and 3 to Battersea sanitary districts. The Metropolitan Asylum Hospitals and the Highgate Small-pox Hospital contained 8 small-pox patients at the end of August, against 103, 40 and 9 at the end of the preceding three months; the weekly

MONTHLY ANALYSIS OF SICKNESS AND MORTALITY STATISTICS IN LONDON.—AUGUST, 1892.

Port of London .. .. .																												

admissions averaged 2, against 29, 11 and 5 during May, June and July respectively. The prevalence of scarlet fever during August showed a further slight increase upon that recorded in recent months. This disease was proportionally most prevalent in Holborn, Whitechapel, St. George-in-the-East, Limehouse, Mile End Old Town, Poplar, Newington, Bermondsey and Plumstead sanitary districts. The Metropolitan Asylum Hospitals contained 3213 scarlet fever patients at the end of August, against numbers increasing from 1142 to 2763 at the end of the preceding six months; the weekly admissions averaged 378, against 170, 200, 238 and 335 in the preceding four months. Diphtheria showed the highest proportional prevalence during August in Hammersmith, Westminster, Bethnal Green, Whitechapel, St. George-in-the-East, Poplar and Battersea sanitary districts. There were 310 cases of diphtheria under treatment in the Metropolitan Asylum Hospitals at the end of August, against numbers increasing from 198 to 283 at the end of the preceding five months; the weekly admissions averaged 55, against 41, 49 and 56 in the previous three months. Among the various sanitary districts enteric fever was proportionally most prevalent in Hackney, Holborn, Whitechapel, Poplar and Greenwich. The Metropolitan Asylum Hospitals contained 93 enteric fever patients at the end of August, against 47, 57 and 77 at the end of the preceding three months; the weekly admissions averaged 14, against 8, 10 and 16 in the preceding three months. Erysipelas showed the highest proportional prevalence during the month under notice in St. Pancras, Holborn, St. Luke, Shoreditch, Whitechapel and Bermondsey.

The mortality statistics in the accompanying table relate to the deaths of persons actually belonging to the various metropolitan sanitary districts, the deaths occurring in the institutions of London having been distributed among the various sanitary districts in which the patients had previously resided. The distribution of these deaths, and especially of those resulting from zymotic diseases, affords the most trustworthy data that can be secured upon which to calculate reliable rates of mortality. During the five weeks ending Saturday, Sept. 3rd, the deaths of 6892 persons belonging to London were registered, equal to an annual rate of 16.9 per 1000, against 16.9 and 17.8 in the preceding two months. The lowest death-rates during August in the various sanitary districts were 8.7 in Hampstead, 11.5 in Lewisham (excluding Penge), 12.5 in St. George Hanover-square, 12.8 in St. James, Westminster, 13.3 in Hackney, 13.4 in Plumstead and 13.5 in Paddington; in the other sanitary districts the rates ranged upwards to 22.0 in St. Martin-in-the-Fields, 22.3 in St. George-in-the-East, 22.4 in St. Luke, 22.5 in Rotherhithe, 23.8 in Whitechapel, 24.7 in Holborn and 34.3 in St. Olave, Southwark. During the five weeks of August 1375 deaths were referred to the principal zymotic diseases in London; of these, 722 resulted from diarrhoea, 219 from measles, 184 from diphtheria, 152 from scarlet fever, 33 from "fever" (including 30 from enteric fever, 1 from typhus fever, and 2 from ill-defined fever) and not one from small-pox. These 1375 deaths were equal to an annual rate of 3.4 per 1000, against 3.1 and 3.9 in the preceding two months. Among the various sanitary districts the lowest zymotic death-rates were recorded in St. George Hanover-square, St. James Westminster, Hampstead, St. Giles, St. Martin-in-the-Fields and City of London; and the highest rates in Hammersmith, St. George-in-the-East, Limehouse, St. Olave Southwark, Rotherhithe, Camberwell and Greenwich. The 219 deaths referred to measles exceeded by 14 the corrected average number in the corresponding month of the preceding ten years; among the various sanitary districts this disease showed the highest proportionate fatality in Kensington, Whitechapel, Limehouse, St. George Southwark, Rotherhithe, Camberwell and Woolwich. The 152 fatal cases of scarlet fever were 34 above the average; among the various sanitary districts this disease was proportionately most fatal in St. Martin-in-the-Fields, Whitechapel, Limehouse; and St. Saviour Southwark. The 184 deaths referred to diphtheria exceeded by as many as 79 the corrected average; this disease showed the highest proportional fatality in Westminster, Holborn, Bethnal Green, Whitechapel and Battersea. The 65 fatal cases of whooping-cough were little more than a third of the average number; this disease was not prevalent last month in any of the sanitary districts. The 33 deaths referred to different forms of "fever" were 33 below the corrected average, and there was no marked excess of fever mortality in any of the sanitary districts. The 722 fatal cases of diarrhoea were as many as 272 below the average; this disease was proportionally most

fatal in Paddington, Fulham, Islington, St. George-in-the-East, Poplar, Rotherhithe and Greenwich. In conclusion, it may be stated that the mortality in London during August from these principal zymotic diseases was nearly 18 per cent. below the average, owing to the fact that the mortality from whooping-cough and from diarrhoea was unusually low.

Infant mortality in London, measured by the proportion of deaths under one year of age to registered births, was equal to 177 per 1000 during August; the lowest rates of infant mortality were recorded in St. George Hanover-square, St. James Westminster, Hampstead, St. Martin-in-the-Fields and City of London; the highest rates in Hammersmith, St. Saviour Southwark, St. George Southwark, St. Olave Southwark, Rotherhithe and Wandsworth.

## THE SERVICES.

### ARMY MEDICAL SERVICE.

Surgeon-Captain W. A. Morris, Army Medical Staff, has been appointed to the staff of the Royal Victoria Hospital, Netley.

### MOVEMENTS OF THE MEDICAL STAFF.

Deputy-Surgeon-General Comyn has resumed duty at Bradford. Surgeon-Captain Dixon has been transferred from Aldershot to Preston for duty. Surgeon-Captain Elderton has joined at Portland and Surgeon-Captain Hains has rejoined at Devonport. Brigade-Surgeon-Lieutenant-Colonel C. A. Maunsell has assumed the duties of Principal Medical Officer, Cork district. Surgeons-Captain Russell and Perry Marsh have arrived at Gibraltar for a tour of service. Surgeon-Captain Hardy has proceeded to Chichester. Surgeon-Major Peyton and Surgeon-Captain Frayer have quitted the Belfast district on leave before embarkation for duty abroad. Surgeon-Captain Wild has reported himself in Edinburgh. Brigade-Surgeon-Lieutenant-Colonel Stevenson has assumed the duties of Professor of Military Surgery at Netley. Surgeon-Major Lamprey has reverted to general duty in the Home District. The death of Surgeon-Major J. Lauder, retired pay, and lately employed at Penally, is reported. The deaths from cholera at Murree of Surgeon-Colonel Allan and Surgeons-Captain H. N. Kenny and Fowler are also reported. Surgeon-Captain Addison has embarked for India on a tour of service. Brigade-Surgeon-Lieutenant-Colonel Murray has left Bermuda for England on leave of absence. Surgeon-Lieutenant-Colonel Fairland has arrived in England from Bermuda on appointment to the Assistant Professorship of Military Medicine at Netley. Surgeon-Captain Baird has embarked for a tour of service in India.

### INDIAN MEDICAL SERVICE.

The services of Surgeon-Captain Alcock, Surgeon Naturalist, Marine Survey of India, have been placed at the disposal of the Home Department for employment as Deputy Sanitary Commissioner of the Metropolitan Circle in Bengal. The services of Brigade-Surgeon-Lieutenant-Colonel G. Thomson, medical adviser to his Highness the Maharaja of Patiala have been placed at the disposal of the Government of India in the Military Department. Assistant-Surgeon Lallubhal B. Kaji, L.M. and S., has been appointed to act as Medical Officer in Charge, Larkhana Dispensary (Sind), from July 29th, 1892, during the absence of Assistant Surgeon M. G. Thadani. Surgeon-Captain J. M. D. Smyth has been appointed to act as Superintendent, Lying-in-Hospital, Madras, during the absence of Surgeon-Lieutenant-Colonel A. M. Branfoot, M.B., on leave. Surgeon-Captain E. H. Wright has been appointed to act as Resident Surgeon, General Hospital, during the employment of Surgeon-Captain Smyth on other duty. Surgeon-Captain D. G. Marshall, I.M.S., has been appointed to the Civil Medical Charge of Roorkee, in addition to his military duties, from the date of taking charge from Surgeon-Captain H. J. Pocock. Surgeon-Captain J. J. Pratt, Civil Surgeon, Gonda, on being relieved by Surgeon-Lieutenant-Colonel C. Cameron, has been transferred to the Bahraich district. Surgeon-Major H. K. McKay, Officiating Civil Surgeon, Nagpur, has been appointed to be Honorary Surgeon, Nagpur Volunteer Rifle Corps, vice Surgeon-Major G. F. A. Harris, I.M.S., on furlough, and who has been placed on the rolls as a supernumerary. On being relieved by Surgeon-Captain D. W. Scotland, M.B., Assistant Surgeon Surendra Nath Barat, Officiating Civil Surgeon and Superintendent of the Gaol,

Betul, has been appointed to the Main Dispensary, Saugur. Brigade - Surgeon - Lieutenant - Colonel S. B. Hunt, Indian Medical Service, has been appointed to officiate as Principal Medical Officer of a District Command, during the absence of Surgeon-Colonel C. Sibthorpe on furlough. Surgeon-Lieutenant W. C. Sprague, M.D., has been appointed to act as Civil Surgeon, Dhulia, during the absence of Surgeon-Major K. A. Dalal, M.B., on privilege leave. Surgeon-Major C. L. Swaine, M.D., Madras Establishment, Medical Officer, 2nd Infantry, Hyderabad Contingent, has been appointed to officiate as Sanitary Commissioner, Hyderabad Assigned Districts, during the absence on furlough on medical certificate of Surgeon-Lieutenant-Colonel C. Little, M.D. Surgeon-Major G. Shewan, Officiating Civil Surgeon of Balasore, is to officiate as Civil Surgeon of Shahabad during the absence on furlough of Surgeon-Major R. Macrae. Surgeon-Captain W. G. Thorold, Civil Surgeon, Kheri, is to officiate as Civil Surgeon, Gorakhpur, during the absence on privilege leave of Surgeon-Major J. Moran. Surgeon-Captain G. J. H. Bell, Bengal Establishment, whose services have been placed at the disposal of the Chief Commissioner, is appointed to be Superintendent of the Insein Gaol.

#### NAVAL MEDICAL SERVICE.

The following appointments have been made:—Fleet Surgeon Valentine Duke to the *Dreadnought* (dated Sept. 13th, 1892). Surgeons: Hugh W. Macnamara to the *Royal Sovereign* (dated Sept. 6th, 1892); Horace B. Marriott to the *Colossus* and George Ley to the *Hotspur* (both dated Sept. 13th, 1892).

#### VOLUNTEER CORPS.

*Artillery*: (Duke of Cornwall's) (Western Division Royal Artillery): Joseph Thomas Hart, Gent., to be Surgeon-Lieutenant (dated Sept. 10th, 1892).—*Rifle*: 1st Volunteer Battalion, the Buffs (East Kent Regiment): Surgeon-Lieutenant J. H. Mitcheson resigns his commission (dated Sept. 10th, 1892).—Surgeon-Lieutenant J. G. McCann resigns his commission (dated Sept. 10th, 1892).—2nd Volunteer Battalion, the Oxfordshire Light Infantry: Surgeon-Captain J. A. Rigge to be Lieutenant (dated Sept. 10th, 1892).—1st Volunteer Battalion the Northamptonshire Regiment: Surgeon-Captain G. S. Payne to be Surgeon-Major; to resign his commission; also to be permitted to retain his rank, and to continue to wear the uniform of the Battalion on his retirement (dated Sept. 10th, 1892).—3rd (the Buchan) Volunteer Battalion, the Gordon Highlanders: The under-mentioned Surgeon-Captains to be Surgeon-Majors (dated Sept. 10th, 1892): N. Lawrence and R. M. Wilson.

#### THE CHAIR OF PATHOLOGY AT NETLEY.

To the Editors of THE LANCET.

SIRS,—I have read in THE LANCET a letter from Dr. Kenneth Campbell, also a paragraph of subject matter stating that great dissatisfaction has been caused by the appointment of a professor of pathology in the person of a civilian medical man. I beg to suggest that the appointment at Netley may be open to all members of her Majesty's services, including the medical officers of the Royal Navy, if there be any fitted for such a distinguished position. They, I think, have an equal opportunity with their military *confères* of obtaining an equal experience in that peculiar branch of pathology required for these appointments, and as they have nothing in their own service to look forward to in the way of professional honours, I think it would be almost an injustice to exclude them from a remote chance of obtaining a well-known and honourable position in the medical world. I may add that it would be a generous and chivalrous opportunity for military officers to show a real act of kindness to, in many ways, their less fortunate brother officers.

I am, Sirs, yours faithfully,

GEORGE EDMONDS, Surgeon, R.N.

H.M.S. *Abyssinia*, Bombay, Aug. 22nd, 1892.

#### THE NEW WAR MINISTER.

The appointment of Mr. Campbell-Bannerman to the post of War Minister is, we believe, generally regarded with satisfaction by different branches of the army. He has the reputation of being a clear-headed and excellent man of business, and there are at the present time a number of matters claiming his consideration which will speedily put these qualifications to the test.

#### THE DEPRECIATED RUPEE.

The fall in the value of the rupee, which does not yet seem to have reached its downward limit, will probably

compel the Government to take some steps before long. The present rate of exchange inflicts a great hardship on all married officials and soldiers serving in India with wives and families to support in this country. Numerous meetings have taken place in various parts of India, and resolutions and petitions have been forwarded to the Government of that country. The finances of India, with its depreciated silver currency, must be a matter of extreme difficulty, not only to the Government there, but to the Minister for India in this country, and it is not, unfortunately, the only complicated and difficult subject with which the Government will soon have to grapple in earnest.

#### MILITARY SERVICE IN GERMANY.

The question of reducing the term of service in the army still occupies a share of public attention in Germany, notwithstanding that most of it is taken up with the larger and more pressing consideration of the existing cholera epidemic. The heavy financial burden imposed on the nation in the shape of taxes, and the strain induced by the withdrawal of such a large portion of the population from industrial pursuits, have naturally led the Germans to consider whether the present limit of three years' training with the colours might not be reduced to two, without detriment to the army and certainly with advantage to the country. These proposals are backed up by the Liberal party in Germany, and it seems probable that some compromise will be effected by which a two years' limit will be generally adopted for the Infantry, with the understanding that all conscripts who have not perfected their military training in that time will be required to extend it with the colours for three years, or until they have reached the required standard of efficiency.

#### THE GERMAN ARMY MANŒUVRES AND THE CHOLERA.

In consequence of the prevalence of cholera the manœuvres of the German Army have been countermanded by order of the Emperor. Although the epidemic at Hamburg has not extended so as to involve any places in the vicinity of that city to any extent, it has been deemed prudent to avoid the risk attending the concentration of large bodies of troops at the present time and their subsequent dispersion to different parts of the empire.

#### THE BLACK MOUNTAIN EXPEDITION.

Officers of the British and Indian Army Medical Services are, of course, as keen to obtain information about any little expedition that may be going on, and to be included in it, as officers of other branches of the army. For one thing, promotion sometimes comes that way, and for another, opportunities for distinction or the exhibition of enterprise occasionally present themselves, and, in any case, field service always adds something to experience in the way of field hospital administration and management, transport and newly devised or applied methods of treatment required by the nature of the country traversed or by the special character of the expedition itself. In all these respects India affords an excellent training ground. At the present time there is more than one of these small expeditions on hand in that country. There is the expected movement of the Black Mountain force for possible service in the Gomul Pass, the occupation of the Kuram Valley by a small body of native troops in accordance with the request of the Ameer of Afghanistan, with the view of preserving order in that neighbourhood, and Lord Roberts's projected military mission and conference with the Afghan ruler, not to say anything of the possible development of affairs in the Pamirs, a matter which concerns the Chinese Government rather than that of this country.

#### THE FOREIGN SERVICE TOUR.

As the one serious grievance which now affects medical officers of executive rank is the length of the tour of service abroad, it is to be hoped that Mr. Campbell-Bannerman will see his way to a favourable consideration of it. We do not pretend to know on what grounds it was originally decided to increase the length of the tour from five years to six at some stations and from three years to four at others; but it has been stated in Parliament that the obstacle to a resumption of the old rule is the increase of expense which it would involve. This appears to us a most lame and impotent conclusion; for if an economy has really been effected at the cost of much suffering and inconvenience to the Service there can be no good reason for persisting in it. It is not a question of increase of expense at all, but of resuming an expenditure which has been unwisely retrenched. It should have been

apparent from the moment that officers on half-pay were appointed to home stations that the effect would be to curtail the amount of home service for those on the effective list, yet that very moment was chosen to lengthen the tour abroad, thereby accentuating the grievance. If the employment of half-pay officers at home facilitated a reduction of the effective staff, surely the economy was sufficient without seeking for further savings at the price now paid for it in the loss of health and prolonged expatriation imposed upon the Medical Staff. There are many officers who hold that it is unjust in principle to fill up so many of the desirable stations at home from the half-pay list. This is perhaps rather a one-sided view; but it must be conceded that it is unjust so to prolong the term of service abroad that a career in the Medical Staff becomes one of perpetually recurring exile.

## Correspondence.

"Audi alteram partem."

### HALSTED'S OPERATION FOR THE RADICAL CURE OF INGUINAL HERNIA.

To the Editors of THE LANCET.

SIRS,—In THE LANCET of Sept. 10th, Mr. Frederick Page reports a case of radical cure of an inguinal hernia by Halsted's method, and compares the operation with that of Bassini, rather to the disadvantage of the latter. Now I have performed Bassini's operation eight times with the most satisfactory results, and I happen to be just as enthusiastically in favour of it as Mr. Page appears to be in favour of that of Halsted, and I wish to point out that Mr. Page has been—quite unintentionally I do not doubt—a little unfair on the question of the merits of the operation that bears the name of the distinguished Italian surgeon. In contrasting the relative advantages of the two operations Mr. Page says: "By every other method the canal is left occupied by the cord and recurrence is common. . . . Recurrence is far less likely to occur—i.e., by Halsted's method."

Mr. Page may possibly be in possession of statistics which he regards as sufficiently trustworthy to prove that Halsted's operation is less likely to be followed by a recurrence of the original hernia than is that of MacEwen, though I venture to think that the short time that the former procedure has been before the profession does not allow of any approach to dogmatism upon the point; but I venture to assert that he cannot have the same reason for preferring it to Bassini's, for the simple reason that—at any rate to the best of my knowledge—all the statistics that have been published concerning the operation show an entire absence of failure. Bassini reports in his original paper 108 cures (lasting for a period of from one to four years after the date of operation) that he was able to trace out of the 262 cases that he had done; while Paul Berger has repeated the operation thirty times without a failure. It is in face of figures such as these that I venture to think that Mr. Page's statements bear a little hardly upon the operation. For my own part, the reasons that incline me to favour Bassini's operation in preference to all others are briefly these:—By means of it the external abdominal ring is firmly sewn up opposite the point at which the cord emerges from the internal, and conversely the internal ring is firmly occluded behind the point at which the cord passes into the scrotum, and thus a new oblique inguinal canal is formed and the rings are reinforced in the valvular manner that nature has planned. In MacEwen's operation, and still more so in Halsted's, the track through which any second hernia has to make its way is the shortest possible, and a direct opening into the abdominal cavity exists through which the cord has to pass, and therefore the chance of averting the recurrence of the hernia lies solely in the thoroughness and solidity of the occlusion of the ring. I freely admit, however, that this preference is a theoretical one and that there is at present no direct practical proof of it, and that is just the reason that has induced me to write this note to point out that it is perhaps a little premature to laud one particular operation at the expense of others without supporting the dictum upon the basis of practical statistical experience.

I am, Sirs, yours faithfully,

Weymouth-street, W., Sept. 13th, 1892. FRED. F. BURGHARD.

<sup>1</sup> Arch. f. Klin. Chir., 1890, t. xl., p. 420.

### MIDWIVES AND ABNORMAL CASES.

To the Editors of THE LANCET.

SIRS,—The enclosed report of an inquest lately held at the Coroner's Court, Hammersmith, distinctly points to the urgent call for some legislation that may prevent the sacrifice of maternal life from the crass ignorance and culpable, if not legal, negligence of the midwife in not calling in medical aid till treatment has become useless. I give you a few of the symptoms. The after-pains continued the whole puerperal week, and, instead of daily being less, increased in severity, the patient had no sleep till the eighth day, and then only from a strong opiate procured by the midwife from a chemist (another evil of counter-prescribing, for this dose masked the symptoms), when she obtained sleep and said she was better. The after-pains from the second day were accompanied with nausea and sickness. The lochia were described to me as horribly offensive. The temperature on my visit on the tenth was 103°; respiration quick and short, the patient excited and rambling, the abdomen distended and tender. The poor woman was so ill the night before I was called in that her husband and a lodger sat up with her all night. Surely any midwife ought to have recognised these symptoms as very serious and obtained qualified medical assistance long before. I opposed the late Midwifery Bill because it was prospective and would have certificated this very ignorant woman and all the "Mrs. Gamps" of her class, but I am not opposed to some useful legislation demanded in the interest of those few women who cannot protect themselves, and think as I advocated in my address (page 5), when contesting a seat on the Medical Council as a direct representative, midwives should only be allowed to act when a doctor has been already engaged and so to act under the eye and responsibility of a medical man, and it would be better that they should be registered as obstetric nurses rather than midwives. I ask for the insertion of this letter, valuable and limited as your space is, because it will, I think, interest numbers of your readers and have a practical value, bearing as it does on this question now engaging the thoughts of a large section of the profession, but particularly the members of the select-committee of the House of Commons on the Midwives Registration Bill. On a rich patient, the doctor would be the ordinary attendant as is now the case; on a poor patient the club or parish doctor.

I am, Sirs, yours obediently,

Sept. 11th, 1892. FREDERICK H. ALDERSON, M.D.

### ON THE USE OF IRON SALTS IN VARIOUS FORMS OF DIARRHŒA.

To the Editors of THE LANCET.

SIRS,—Some few months ago, while engaged in the study of Bunge's Physiological and Pathological Chemistry, as translated by the late Dr. Wooldridge, I was much struck by his theory of the action of iron in chlorosis. While thinking this over, though not in entire agreement with him, I was impressed by the idea that it was not only possible but probable that iron might have a decided action in many cases of diarrhœa, by combining, as bismuth does, with the sulphuretted hydrogen and alkaline sulphides, to form inert insoluble metallic sulphides, and so check the diarrhœa by removing secondary, if I may so call it, irritation. It did not appear to me to be necessary to give the astringent forms of iron, on the assumption that, whatever forms of iron are given, it is probable that in the stomach they are converted into the chlorides and ultimately in the bowel after various changes into sulphides. The salt I chose for chief use was the citrate of iron and ammonia, though in some cases I used Blaud's pills. For some time now I have treated a large number of cases of infantile diarrhœa, in many cases apparently due to defective sanitation, of irritative diarrhœa, and some of tubercular diarrhœa by this means and with almost unvarying success. The rapidity with which the offensive smell of the motions disappears has exceeded anything I had thought likely, and half-a-dozen of my cases have apparently been so successful that I feel justified in suggesting that others may have a like success. In two or three cases too early a stoppage of the treatment was followed by a return of an offensive diarrhœa, which was soon checked again by resuming it. In one case, in a woman, a very violent attack of four days' duration, with intense griping and copious, watery,

very offensive evacuations at frequent intervals following the eating of food, which her husband said at the time was unfit for use, was relieved in twelve hours, and entirely removed in two days. Another case with motions of a distinctly typhoid fever character, but with no spots, in which I was watching the temperature, ended in the same favourable way. Children of three or four months old take without any inconvenience five grains of the salt every four or five hours; adults up to thirty grains every two or three hours. While discussing the therapeutic possibilities of iron, the following, though not entirely connected with its use in the treatment of diarrhoea, seems worthy of note. The combination of the tincture of the perchloride of iron with the solution of muriate of morphia yields a green solution, I imagine, with the formation of apomorphine or some similar derivative. Be this what it may, I have seen from the combination more distinct and rapid relief to the cough and diarrhoea of phthisis than from the administration of the drugs separately.

I am, Sirs, yours faithfully,  
Rochdale, Sept. 12th, 1892. WILLIAM STANWELL.

### "A CASE OF FRACTURE OF THE HUMERUS FROM DIRECT MUSCULAR ACTION."

To the Editors of THE LANCET.

SIRS,—The following case may be of interest to your readers as most uncommon if not unique. On July 22nd I was called to see a gentleman aged thirty, not extremely muscular, but well nourished and perfectly healthy in every respect. He gave me the following history: Whilst trying to "throw the cricket ball," practising for some athletic sports, having made his throw he felt his arm suddenly give way—the ball went about seventy yards—and he heard a report which everyone else in the field heard distinctly also. He tried to raise his arm and could not. On examination I found a transverse fracture of the right humerus situated at the junction of the middle and lower thirds. I set it in the usual manner, took it down on Aug. 19th, and he is now able to resume his occupation.

I am, Sirs, yours truly,  
Sept. 13th, 1892. J. W. HARRIS, L.R.C.P. LOND., M.R.C.S.

### MIDWIVES' REGISTRATION BILL.

To the Editors of THE LANCET.

SIRS,—As one who has read with much interest your account of the proceedings of the Select Committee in the matter of the Midwives' Registration Bill, I believe I am not alone in taking exception to the evidence as given by Dr. James Edmunds regarding the high mortality among lying-in patients attended by general practitioners as compared with midwives. To me it seems he gives the reason for this in his evidence when he says, "If any intercurrent illness occurred she would turn the patient over to a medical man." Dr. Hugh Woods gave the answer to this when he said "cases usually passed into the hands of doctors when death became imminent, and so went to their credit." I have long been under the impression that to get at the true state of affairs some sort of legalised form of death certificate should be in use, so as to show to the registrar whether a duly qualified person attended during the confinement or not. May I ask, would it be right for the doctor into whose hands these cases now pass to state in the certificate: (a) Parturition; attended by a midwife; (b) —? I am, Sirs, yours truly,

JAS. T. T. RAMSAY, L.R.C.P. Edin. &c.

Blackburn, Sept. 10th, 1892.

### OUR DUTY TO OUR PATIENTS.

To the Editors of THE LANCET.

SIRS,—On p. 374 of THE LANCET of Aug 13th I notice an article headed "The Hygiene of the Teeth." Doctors are often some of the worst sinners against their patients' health; for how frequently does one meet with a case of dyspepsia or neuralgia arising from faulty teeth, the latter attributed, and in many cases not without good cause, to having taken a large quantity of medicine in some previous illness? Those who are under the unpleasant necessity of dispensing their own medicines can at least use labels with directions that the mixture is to be taken through a tube or quill. Hospitals might do the same, all practitioners might

take the like precautions, whilst some check should be put upon the sale of those patent medicines that are known to act injuriously in this respect. Any chemist can make the required addition to an ordinary label, or procure a supply ready printed from a wholesale firm. Whilst looking after the rest of the body it is our duty not to damage so important an organ as a tooth. It matters not to us that some patients should refuse to carry out an instruction they may regard as irksome and valueless. Great stress is frequently laid on the functions of the rectum and the colon, but how much discomfort might be saved were due attention given to the care and cleanliness of the teeth and the proper mastication of food? Among the poor one frequently sees long unsightly teeth thickly coated with green, foul-smelling matter and standing in irritated and receding gums. Their owners are troubled with an unpleasant taste in the mouth—acidity, flatulence and other attendant evils. Many will not go to the trouble of procuring floss silk, excellent though it be, but they readily make use of a charred match to clear away some, at any rate, of the fermenting material between the teeth. Perhaps in ordinary practice it might be thought bad taste to supply patients with a few printed simple rules; but amongst the poor and in unopposed practices it appears to me that great good might result, and no harm be done, by the distribution to one's own patients of leaflets such as that now enclosed. Any required additions or alterations can easily be made to suit particular cases, and so long as no name is printed there seems but small possibility of encroaching on one's neighbour's practice.

A large London hospital has kindly given permission for the reprinting of their hints on the bringing up of babies. The rising generation is greatly damaged by being surfeited with boiled bread, biscuits, tea &c.—"just what we have ourselves." A few simple, common-sense rules would help to improve the health of those destined for a life of toil for which under present circumstances they are unfitted, and partly because, ere the struggle has begun, their constitution has already been impaired. Could you, Sirs, or one of your readers, mention any similar leaflet giving directions for the care of those recently confined, I feel sure that many practitioners would be only too glad to procure a supply for distribution, under suitable circumstances, to their patients, and thus many of the evils now looked upon as usual after confinement would be obviated. It frequently happens that a woman, from shortsightedness, gets up prematurely from her bed to undertake duties for which she is utterly unfit, thus rendering herself temporarily or perhaps permanently incapacitated for her duties as a mother. The leaflets cost about 9s. per thousand, so that the expenditure of a single penny might place many families in a position of far greater comfort and perhaps of even helping to improve the vital statistics of the nation.

I am, Sirs, yours truly,

Reading, Sept. 7th, 1892.

SPES.

### LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

#### The Licensing Sessions.

THE annual Licensing Sessions for the city of Liverpool have just concluded, the result being that there will shortly be nineteen fewer houses licensed for the sale of intoxicants than last year, and forty-five less than the year before. It is possible that this number may be slightly lessened on appeal. The magistrates have shown a firm determination to suppress any houses which are the resort of prostitutes or the scene of repeatedly disorderly conduct. They have also insisted upon the internal structural arrangements being such as to afford perfect facilities for the supervision of the police, and that the person named in the licence shall personally conduct the business and be responsible for whatever occurs on the premises. There is every reason to believe that these measures will lead to a reduction of intemperance and of the other evils to which it gives rise.

#### City Morals.

Among other resolutions brought before the city council at its last monthly meeting was one from the Watch Committee proposing that Parliamentary powers should be sought to enable the police to enter any house suspected to be a brothel and to arrest any person of either sex found there. The recent action of the Watch Committee has led to the prosecution

and conviction of a large number of persons keeping brothels in streets where such houses have been for many years tolerated. The result is that many of these houses are empty and their former inmates have been scattered, only, it is feared, to inhabit houses in other parts of the city hitherto free from them. As much feeling was exhibited against the proposed resolution it was withdrawn.

#### *An Epidemic of Violence.*

A tramcar conductor is lying in the Royal Infirmary suffering from concussion of the brain, the result of a blow on the head from a stick. A boy is lying at the Stanley Hospital suffering from a similar injury, the result of an assault, his assailant having first lifted him up and then dashed him violently to the ground. Several of the city police constables are on the "hurt list" as the result of violent assaults made on them during the last few days. A young man is lying in the Bootle Hospital suffering from a gunshot wound in the head; a bullet and a piece of bone have been extracted, but he remains in a very serious condition. The shot was fired by a man in custody, who states that he fired thinking that it was a blank cartridge.

#### *The Health of the Port.*

No other case of cholera has been reported, and all apprehension of any serious outbreak here has passed away. At the same time there has been no relaxation of vigilance on the part of the authorities, and any vessels coming from infected ports will be stopped and the crew submitted to careful medical examination before being permitted to land.

September 14th.

### MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

#### *Small-pox.*

A SHARP though as yet limited outbreak of small-pox has recently occurred at Failsworth, a manufacturing district on the north-eastern confines of Manchester. The first case occurred on August 25th, and it was then ascertained that the disease had been lurking undetected for six weeks before its presence was officially suspected. Up to the present time, at least ten small-pox cases have been admitted from this district to Monsall Hospital, which is fortunately close by. One of the patients is the sanitary inspector of the district, who was stricken with the disease in the course of his duties, and was removed to hospital early last week. The medical officer of health for Failsworth has apparently been unremitting in his exertions against the further spread of the malady, and he evidently receives the support of the sanitary authority. One good result of this local outbreak has already been made public; at the last monthly meeting of the Failsworth local board, the Act for the Compulsory Notification of Infectious Disease was formally adopted, Failsworth being one of the very few districts in this neighbourhood which had not previously enjoyed the protection which that Act is capable of conferring. Although, as is well-known, small-pox has been rife in several Yorkshire towns and villages in daily communication with Manchester, and individuals suffering from that disease have been from time to time detected either in the common lodging-houses or in the workhouse tramp wards, nevertheless small-pox has not as yet obtained a foothold in the city. Every case has been removed to the hospital and isolated as soon as discovered. The desirability of vaccination or revaccination has been impressed upon all persons who have been in contact with infection, and the disinfection of contaminated bedding or clothing has in all cases been insisted on.

#### *Cholera Precautions.*

The sanitary authority of the city have taken timely precautions against the possible importation of persons from abroad who may arrive here whilst incubating cholera. The corporation have with commendable promptitude made arrangements with the authorities of Monsall Hospital for the isolation and treatment of any cases of cholera that may find their way into the city. They have also erected additional temporary accommodation at Monsall to meet any emergency in regard to cholera which is likely to arise. With the object of restoring public confidence the Sanitary Committee have given the city officer of health *carte blanche* to take whatever

action he may consider advisable for the protection of the public health. One of Dr. Tatham's earliest acts was to organise a house-to-house visitation of the poorer districts of the city. In the Jewish quarters of the city handbills of precautions against diarrhoea and cholera, printed in Hebrew, have been circulated from house to house. About half a dozen persons from Hamburg have arrived here within the last ten days, and as they have come in infected vessels they have been kept under the necessary supervision by the medical officer of health.

#### *Relief of Pauperism in Manchester.*

The Board of Guardians of the Manchester Union have just published an instructive report on the working of their Relief Department. The report is from the pen of Mr. R. W. Guillette, assistant clerk to the guardians. There appears to be an increase in the number of applicants for relief, equal to 9 per cent. on the numbers of last year. In 23 per cent. the cause of destitution was stated to be "want of work." This, however, according to Mr. Guillette, must not be taken to mean that work was abnormally scarce during the year, but rather that many of those in want of work laboured under some physical or mental shortcoming which rendered their services of little market value. Persons of this class are apparently numerous, and Mr. Guillette says of them "that they are the last to benefit by a revival of trade, but the first to feel its decline." In not less than 64 per cent. of the total cases relieved, the ground on which assistance was claimed appears to have been either old age or some other incapacitating infirmity.

September 14th.

### NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

#### *Cholera Alarms and Precautions.*

THE alarm felt in Newcastle and district as to cholera has a good deal subsided; still, it is right to say that the necessary precautions are continued, and the city in any case will be much the better for the extra cleansing and sanitary attention which it is receiving. The War Office authorities have applied to the city council for leave to erect a temporary hospital on the Newcastle Moor in case of its being required for the troops in barracks, and the request has been acceded to. There has been a good deal of alarm at Blyth owing to a Hamburg steamer arriving with a case of diarrhoea, but the medical officer of health reports the river and town as being in a healthy state; it has been decided, however, to increase the hospital accommodation in case of need. The Blyth local board has applied to Sir Matthew White Ridley for power to erect a hospital on some portion of the Lints. Mr. Alderman Richardson's motion respecting increased powers for the Tyne port sanitary authority was carried last week. The powers meant are of course quarantine, and the necessity for this was strongly pointed out by several members. For instance, it was shown that, had the case of cholera on board the *Ilbo* been a few days longer in developing, the patient and his mates would have been on shore among their friends.

#### *An interesting Presentation to a Cumberland Surgeon.*

Mr. F. Postlethwaite, M.R.C.S., of Stapleton Brampton, Cumberland, was waited upon last week by a number of patients and friends in the district, who presented him with a new and handsome carriage. Mrs. Postlethwaite was presented at the same time with a purse of gold.

#### *Death of Mr. John Churchill, M.R.C.S., L.S.A.*

Mr. Churchill died at his residence, Hall Croft, near Carnforth, last week. He was educated at the Middlesex Hospital and qualified so far back as 1839. He practised mostly in Whitehaven, and retired about thirty years ago. He was placed on the Commission of the Peace for the county in 1880. The deceased gentleman was a bachelor, and it is understood that his body will be cremated at Woking.

#### *The Diagnosis of Malignant Infectious Disease.*

Dr. Whamond of Jarrow has issued a circular to the profession, in which he takes exception to the statement of our medical officer of health to the Tyne Port sanitary authority "that 95 per cent. of our medical men are incapable of

diagnosing a case of malignant infectious disease." Dr. Armstrong's remarks were based on a case of hæmorrhagic small-pox which unfortunately came to Newcastle from North Shields, where it had escaped notice. Now the case even at Newcastle was not diagnosed at once, as the man was about the Infirmary waiting-rooms, and was afterwards taken into a ward. As pointed out at the time in THE LANCET in an annotation on the subject, the diagnosis of this fatal form of small-pox is by no means always easy, though a few hours will often clear up the obscurity. Dr. Armstrong is a strong advocate for young graduates acquiring a knowledge of the treatment of infectious diseases before they begin practice, and he probably had this in view when he made the statement.

#### Sunderland: Election of a Medical Officer of Health.

The election of medical officer of health for Sunderland has been watched with some interest by the profession, and, as was expected, the post has been given to Mr. John C. Wood of Sunderland. Mr. Wood has been for some time surgeon to the police and deputy medical officer of health, and his appointment has given general satisfaction.

#### Tynemouth Water-supply.

The water-supply at Tynemouth has long been a drawback at this otherwise popular health resort. A special meeting of the Tynemouth Town Council has been held for the purpose of considering a report presented on this matter by the medical officer of health and the borough engineer, which stated that the available supply only equalled 14·8 gallons per head per diem, while at least twenty-eight gallons per head per diem were considered necessary. The report further stated that any arrangement that did not provide a reserve store for at least one month could not be considered as satisfactory. On the other hand, it is stated that there is at present a considerable waste of water, described as wholesale. Consequent upon the cholera scare the sanitary authority has given certain directions as to flushing and cleansing which, if not discontinued, will compel the borough authorities to restrict the supply to six hours a day. In Newcastle we have an abundant supply, and I believe sufficient to spare to supply Tynemouth and North Shields should the necessary connexion be made which I believe is under consideration.

Newcastle-on-Tyne, Sept. 12th.

## SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

#### Arrangements for Women Students at the Edinburgh Royal Infirmary.

THE managers of the Royal Infirmary some weeks ago devised steps which will provide for the medical education of women within the walls of the infirmary. As was stated in THE LANCET at the time that the purchase was made, the managers acquired property to the west of Lauriston-lane, with a view to the extension of the accommodation for patients. The building at present on the purchased land is to be used for the nursing and serving staff, and thereby two additional wards are to be available for the reception of patients, and these are to be used for the clinical instruction of women. One is to be medical and the other surgical, and it is expected that the senior assistant physician and the senior assistant surgeon will have charge of them. In addition all the special departments—the ear and throat, eye, skin, gynaecology and lock—are to be open to the women students, presumably at different times from the male students; but the clinics may be mixed, this point, so far as is known, not being definitely settled. The medical out-patient department will also be made more or less available for women students. No further arrangements, so far as is known, have been made. There is no rumour of the Edinburgh University taking steps similar to those taken by the Glasgow University for providing teaching that will qualify women to appear for the University medical examinations, although the Commission gave them the power to do so.

#### Edinburgh University Financial Statement.

Reference was made last week to a Parliamentary paper prepared by the University Court on the finances of the University. There has been published another of these statistical

reports dealing with the incomes of the University officers. The report is for the year ending Sept. 30th, 1891, and is furnished in accordance with the requirements of the Universities (Scotland) Act, 1889. It contains much material for contemplation by those interested in medical education in the University. In none of the Faculties can many of the occupants of chairs be commiserated on the poverty of their livings, but it is with medicine we are specially interested. Details of shillings and pence need not be particularised. The gross incomes of each professor are given below and also the amount he spends on assistants and other expenses:—

	Income.	Expenses
Professor of Botany .. .. .	£1785	£205
" Physiology .. .. .	2408	783
" Practice of Physic, including Clinical Medicine .. .. .	1752	78
" Anatomy .. .. .	2984	493
" Chemistry .. .. .	2510	1190
" Midwifery, including Clinical Medicine .. .. .	1205	110
" Natural History .. .. .	1829	320
" Materia Medica, including Clinical Medicine .. .. .	2431	370
" Clinical Surgery .. .. .	1105	80
" Medical Jurisprudence .. .. .	909	252
" Surgery .. .. .	1602	450
" Pathology and Clinical Medicine .. .. .	2393	303

The income and expenses of the Professor of Pathology given here are from the return for the preceding year, as they are not filled up for last year. The number of assistants in each department is as follows:—Botany one, salary £220; Physiology three, salaries £100 to £400; Practice of Physic one, salary £100; Anatomy five, salaries £42 to £235 10s.; Chemistry five, salaries £50 to £275; Midwifery two, salaries £65 10s. to £100; Clinical Medicine one, salary £160; Natural History one, salary £300; Materia Medica two, salaries £120 and £200; Clinical Surgery one, salary £50; Medical Jurisprudence one, salary £250; Surgery three, salaries £100 to £150; Pathology (previous year) three, salaries £20 to £170. The number of students attending some of the practical classes are: Physiology, 338; Anatomy, 534; Chemistry, 309; Pathology, 240. The total number of students matriculated for the academic year was 1809 and for the summer session only 194. There is one other startling set of figures. The University has laboratories in which provision is made for work beyond the elementary and rule-of-thumb work of what are called practical classes. The following are the laboratories in which work of the kind has been done and the number of persons who have worked in them: Physiology, 10; Chemistry, 20; Medical Jurisprudence, 35; Pathology, 0. The above details speak for themselves and put a strange complexion on the cry that original work is not done in the University as there are no funds to pay workers.

#### Leith and Cholera.

There is considerable talk in some quarters as to the apathy of Leith at the present time. It has a large trade with the Continent, and usually a very large one with Hamburg. The notification of infectious diseases is not in force, and it is said that thousands of baskets of fruit have arrived from Hamburg and been distributed all over the country. Ought such things to be?

#### University Chair of Surgery.

The contest for the chair of Surgery in the University, rendered vacant by the lamented and sudden death of Sir George H. B. Macleod, has been much simplified by the announcement that Dr. H. C. Cameron does not intend to stand as a candidate. This leaves the field practically clear for Dr. William Macewen of the Royal Infirmary, for, though other candidates of local renown in Glasgow and Edinburgh are spoken of, their claims sink into insignificance beside those of Dr. Macewen. The feeling of the profession here is very strong on the subject and is perfectly unanimous, and if by any chance Dr. Macewen were passed over, resentment in both professional and lay circles would be keen, as the people of Glasgow as a whole are proud of their townsman. A memorial was presented to Sir G. Trevelyan on Wednesday last while the right honourable gentleman was on a visit to Glasgow, pointing out Dr. Macewen's eminence as a surgeon and the unanimous desire of the profession that he should be appointed to the office held by his old infirmary chief. I also understand that Dr. Charles W. Cathcart, assistant surgeon in the Royal Infirmary, Edinburgh, is a candidate for the post. Another candidate spoken of is Dr. Crawford Renton of the Western Infirmary, Glasgow. Professor Victor Horsley's name has also been mentioned.

*Western Infirmary.*

The managers of this institution have determined to transform it into a joint-stock concern, incorporating it under the Companies Acts, 1862 to 1890, and they have just been authorised by the Court of Contributors to sign the memorandum and articles of association to that effect. The principal object to be attained in thus registering the infirmary under the Joint Stock Acts is to obtain perpetual succession, or, in popular phrase, to save the trouble and expense of recurring conveyances of the property of the institution from one set of trustees to another as deaths occurred among them. The memorandum and articles of association have received the approval of the Board of Trade.

*Lectures on Cholera in Glasgow.*

Dr. J. Lindsay Steven on Monday last delivered the first of a short course of lectures on cholera to the nursing staff of the Glasgow Sick Poor and Private Nursing Association. The lectures are being delivered under the auspices of the directors of the institution and have been thought necessary in view of the near approach of cholera to our country.

*Insanitary Houses in Buchan.*

Dr. Watt, reporting to the Aberdeenshire County Council Committee, mentions the following cases:—The sleeping apartment at Bilbo-park was still in the same condition. Its greatest height was 5 ft. 6 in., and the ventilation was by means of a skylight opening towards a dung heap. It was separated from the cow-house by a wooden partition so defective that the foul air came through it, and at the other side the foul air from the stable had ready access, the floor being very defective. The house at Tassathill was neither wind- nor water-tight; it had a dung heap within three feet, parts of the bedroom walls were green with mould, and rat holes were plentiful (indeed, a rat-trap was set in the middle of the floor), and the roof and chimney were dangerous. Other houses were not inhabitable.

*Health of Aberdeen.*

During last week 15 cases of measles, 19 of scarlet fever, 1 of typhoid fever, 11 of whooping-cough and 2 of erysipelas were reported to the medical officer of health, being a decrease of 12 on the whole as compared with the preceding week. There were no cases of diphtheria, typhus fever, small-pox or puerperal fever.

At a meeting of the Public Health Committee of the Aberdeen Town Council held this week it was reported that the estimated expenditure for the ensuing year would be £817 in excess of the income. There will, however, be no increase in the rate, as it is at present at the maximum. There were also considered the plans of the proposed addition to the City Hospital, which are estimated to cost £12,800. After discussion consideration was deferred for some days.

Sept. 13th.

## IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

*Reformatory and Industrial Schools.*

FROM the thirtieth annual report it appears that at the close of 1891 there were seven reformatory and seventy industrial schools in active operation in Ireland. The children in reformatory schools numbered 786 and in industrial schools 8547. The inspector strongly insists on the evil effects of short sentences and states that all authorities agree that sentences to a reformatory should be for a maximum period of five years. It should also be remembered that a five years' sentence does not of necessity mean five years' detention in a reformatory, for managers have power to license after half the sentence has expired, and may obtain a discharge at any time if they can show that it is for the advantage of the young offender. The cost of industrial schools was £160,317 12s. 10d. or an increase of £2043 11s. 9d. over that of the previous year; while the cost for each child averaged £17 17s. 3d., and for the reformatory schools the average was £21 15s. 1d. The health of the children has been most satisfactory. In reformatory schools there were no deaths from contagious or infectious disease, or any serious epidemic in any of them; while in industrial schools there were eighty-nine deaths out of about 10,000 children under

detention. Of these eighty-nine deaths thirty-six were due to lung disease, and, although the winter has been a singularly bad one, the death-rate from consumption was 3.6 per 1000, as against 4.1 the year before. Ophthalmia was rather prevalent in several of the industrial schools, and the inspector wisely remarks that managers incur a grave responsibility who permit children to be treated for it by any person other than a skilled physician.

*Grievances of Dispensary Medical Officers.*

On the 10th inst. a meeting was held at the Royal College of Surgeons to consider the propriety of forming a Union Medical Officers' Association. After some discussion it was determined to summon a special meeting of the Irish Medical Association, and that all provincial dispensary officers should be urged to attend.

*South Charitable Infirmary, Cork.*

At a late meeting of the trustees a letter was received from Miss Dora Allman requesting permission to be admitted to clinical teaching at the South Infirmary session of 1892-93. She pointed out that the council of the Queen's College had already made arrangements for the admission of women to the dissecting-room and to all the medical lectures of the college; while in Belfast last winter six ladies had attended the practice of the Royal Hospital. Miss Allman had recently passed an examination of the Royal University of Ireland, and if refused admission to the infirmary would be unable to remain in Cork to attend lectures. Professor Hartog of Cork College, on behalf of the students, stated that they were in favour of the trustees granting the same facilities to women as to men. The board will hold a special meeting this week to consider the matter.

*Proposed Floating Hospital for Cork.*

A meeting of the rural health committee was held on Monday to discuss the proposed floating hospital for the harbour, for which Sir John Arnott had offered a hulk, and to consider the question of precautions against cholera. The military authorities propose to land any cases of cholera that may occur among troops arriving in Cork Harbour for treatment at a cholera hospital to be especially formed in the harbour—namely, at Spike Island, Fort Carlisle and Fort Camden. The guardians, however, consider that a floating hospital, as the sanitary committee suggested, is the proper place for sea-borne infectious cases to be treated, and they object to cases being removed to Spike Island or any other place except the floating hospital. Mr. Hodges has recommended that the guardians should purchase a vessel called the *Drowning Sophia*, and a resolution to have that vessel examined and, if advisable, purchased for use as a cholera hospital was adopted. Sir J. Arnott has expressed his willingness to put one of the hulks in Passage Docks in a seaworthy condition and in a sufficient state of repair to enable it to be used for the purpose of a floating hospital.

*Queen's College, Belfast.*

The report of the President of Queen's College, Belfast (Rev. Dr. Hamilton), has just been printed for the session 1891-92, and it shows that the Ulster College is in a very satisfactory condition. The number of students was unusually large, there being in the Faculty of Medicine 270, in Arts 185, in Engineering 11, and in the School of Law 19. Four students attended in more than one faculty and the total number of students in attendance was 481. There were eight ladies in the classes. The number of freshmen who entered for the first time was 155. A very satisfactory arrangement has been made in connexion with the teaching of pathology, the trustees of the Sorella Trust (created by the late William Dunville, Esq., of Belfast, to perpetuate the memory of his sister, Miss Sarah Dunville, who died in 1863) having informed the President that they propose to provide an endowment of £240 per annum for the establishment of a separate chair in the college, to be called "The Dunville Professorship of Pathology." It is owing to the munificent action of Mr. R. G. Dunville, D.L., nephew of the late Mr. Wm. Dunville, that this has been done. He has also acquired from the trustees a portion of ground belonging to the trust and presented the same to the citizens of Belfast to be maintained for all time as a public park. Mr. W. H. Barrett, M.B., of Edinburgh, has been appointed lecturer on pathology. Reference is also made in the report to the new chemical laboratory which is being built in the college

grounds and also to the projected new building for the students' union. Towards the realisation of this project over £3000 has already been subscribed. The President advocates the erection of a biological and a physical laboratory and increased accommodation for the specimens in the natural history museum. Reference is also made in the report to the great successes of Belfast Queen's College men in the Royal University examinations and to what the college has done through the very distinguished graduates it has sent all over the world.

#### The Cholera Epidemic.

So far no new cases of cholera have occurred in Belfast and the authorities are taking every precaution to prevent its entrance to the city. An intercepting hospital, built at the Twin Island, has been fitted up, and Dr. Craig of Mountpottinger has been appointed to take charge of it.

#### The Ormeau Park.

A great deal of discussion is taking place in Belfast in reference to the gasworks. Owing to the very rapid increase in the size of Belfast it will be necessary to extend the present gasworks. There is no more room in their present position, but it has been proposed to build the new manufactory in Ormeau Park on the opposite side of the river to the old gasometers. Those opposed to this site say it would injure this public park and they advise building in some other place. There is also a strong feeling amongst many that an attempt should be made by the Corporation, who own the gasworks, to introduce the electric light into Belfast. It is stated that at a meeting of the Gas Committee of the City Council, held on Sept. 12th, it was decided not to build in the Ormeau Park.

An inmate of the Carlow Lunatic Asylum who had escaped committed suicide this week by hanging himself.  
Sept. 14th.

## PARIS.

(FROM OUR OWN CORRESPONDENT.)

### CHOLERA AND ITS PREVENTION BY INOCULATION; EXPERIMENTS IN PARIS.

CONSIDERABLE interest has been aroused by the appearance, within the last few days, in the columns of some morning contemporaries of paragraphs announcing the discovery by M. Haffkine of a successful method of inoculation for cholera. Being desirous of supplying the readers of THE LANCET with a scientifically accurate account of the results hitherto yielded by the method as applied to the human being, as well as of the laboratory experiments upon which the method is based, I accordingly sought an interview at the Institut Pasteur with the discoverer himself. I found M. Haffkine busily engaged in his laboratory. His scientific preoccupations did not, however, prevent him receiving your representative with that quiet, dignified courtesy which is so characteristic of searchers after truth. After some conversation, M. Haffkine very kindly handed me reprints of papers read by him at the Société de Biologie on the 9th, 16th and 30th of July, 1892. These papers, he said, contained all the information I desired. I accordingly send you herewith an analysis of them. Those read on the 9th and 16th of July bore the titles "Le Choléra Asiatique chez le Cobaye," "Le Choléra Asiatique chez le Lapin et chez le Pigeon," respectively. By July 30th, the experiments having been extended to man, the communication made on that date was "L'Inoculation de Vaccins Anticholériques à l'Homme." In the early experiments the intensification and the attenuation of the cholera virus was the object, advantage being taken of the method so successfully put into practice by the illustrious Pasteur himself and by his pupils in their studies on chicken cholera, anthrax, *rouget du porc* and diphtheria. It was found that when Pfeiffer's plan of introducing cholera bacteria cultivated on the surface of nutritive gelatine into the peritoneal cavity (of guinea-pigs) was pursued the disease was not transmitted from one animal to another, as the microbe disappeared early in the series. In order to procure intensification of the virus by its passage through a series of animals recourse was had to the following manœuvres:—1. A dose of virus collected from a gelatine plate in a sufficient quantity to kill several animals was injected into the peritoneal cavity of the first guinea-pig. The

animal died with a peritoneal effusion abounding with microbes, the fluid effused varying, curiously enough, with the size of the guinea-pig. In a large-sized animal the matter was abundant and dilute, whereas it was less abundant and more concentrated in smaller animals. 2. This fluid is left for several hours exposed to the air at the ordinary temperature. 3. It is now inoculated into other animals; those that are small-sized receiving some of the dilute and those that are large the concentrated products.

A series of transmissions thus conducted leads at length to the production of a constant virus (*virus fixæ*)—i.e., a virus (yielded by cultivation from the microbe) which is constant as to time and dose in its lethality. After from twenty to thirty transmissions no further intensification was observed. These experiments provided M. Haffkine with a virus whose poisonous properties had increased about twenty-fold, and which killed rabbits and pigeons at doses which were previously innocuous. The problem of the intensification of the cholera virus having been solved, its effect on animals, into whose thigh muscles it was injected, was tried. All these animals died. Introduced subcutaneously, the animal's general health did not suffer in the least, but there was provoked enormous œdema of the limb, which, spreading over a large area, ends in mortification of the tissues involved. Healing, however, ultimately takes place. It was now sought—and successfully sought—to procure an attenuated virus from which these gangrenous properties should be absent. This was done by cultivating it in bouillon at a temperature of 39° C. and in an atmosphere kept constantly aerated (method applied to the diphtheria bacillus by MM. Roux and Yersin). Under these conditions the cholera vibrio perishes rapidly. In order to prolong the experiment sufficiently long for the procuring of the attenuation the microbe is re-sown in a fresh culture medium every two or three days. This method yielded a virus which, inoculated into the areolar tissue of animals in even large doses, did not bring about the phenomena of necrosis with which the concentrated variety is endowed. Now comes the application of this attenuated virus as an inoculating agent (for animals) against Asiatic cholera. The satisfactory discovery was in fact made that a previous inoculation with the attenuated virus prevented all necrosis in animals into whose subcutaneous tissues a quantity of the strong virus was introduced. It was further found that an animal that had been subjected to inoculation, first with the attenuated and then with the intensified virus, was incapable of contracting cholera, whatever mode of production of the disease was adopted. The comma bacillus may with impunity be deposited in the intestine, opium being injected into the peritoneal cavity directly afterwards, after the method of Nienti and Rietch and of Koch. M. Haffkine soon afterwards discovered that the above phenomena were as applicable to the rabbit and the pigeon as to the guinea-pig. The most murderous assaults of the microbe of the cholera now present, as it has been for the past five months, in an endemic form in Paris were resisted by these animals, who had been inoculated first with attenuated and then with intensified virus. It is pointed out by M. Haffkine that the Paris bacillus has shown itself as lethal in the laboratory as the Madras, Calcutta, or Saigon variety.

The protective power of M. Haffkine's anticholeraic vaccine having thus been amply and conclusively demonstrated in the case of animals so varied as guinea-pigs, rabbits and pigeons, its effect on the human being was tried. On July 18th M. Haffkine introduced into the areolar tissue of his own left flank a dose of the first (or attenuated) anticholeraic "vaccine," superior to that which proved protective to the above-named animals. The constitutional disturbance produced by the inoculation lasted twenty-four hours and consisted of an elevation of temperature, which rose from 36.6° C. to 37.5° C., headache, dryness of the mouth and high-coloured urine. There were no gastro-intestinal symptoms whatever. Locally there was pain at the seat of inoculation, with slight swelling of the part, and also of the corresponding lymphatic glands. The pain had completely disappeared by the fifth day, leaving some swelling, which, however, entirely disappeared in its turn four days later. On July 24th—i.e., six days after the first inoculation—a quantity of the second (or intensified) "vaccine" was injected into the areolar tissue of the (right) flank. The temperature rose to 38.6° C.; there was some local pain, but no swelling of the part or of the lymphatic glands was noted. The febrile condition lasted only twenty-eight hours, and the local pain had completely ceased three days after the inoculation. The digestive organs remained unaffected. Encouraged

by these results, M. Haffkine proceeded to inoculate certain of his compatriots. Dr. Jawein of St. Petersburg, who weighed seventeen kilos more than M. Haffkine, received on July 22nd the same dose of the first (or attenuated) "vaccine." The malaise, which lasted five hours only, was slight, the temperature rising from 37.2° C. to 37.6° C. The apparent local swelling lasted about three days, but some œdema could be perceived on pressure on the fourth day. Seven days after the first inoculation the strong virus was injected, the reaction this time being scarcely appreciable. In three hours the temperature had risen from 37.2° C. to 37.4° C., falling at the expiration of five hours to 36.9° C. The local phenomena were much less marked than after the first inoculation and the constitutional disturbance was conspicuous by its absence. On July 25th Dr. Tamamcheff of Tiflis was inoculated with four-fifths the quantity of "vaccine" that had served for M. Haffkine. At the moment of the operation Dr. Tamamcheff's temperature was 38° C. (100.4° F.), there being thus previously to the inoculation some fever. Nine hours later the mercury rose to 39.1° C. (102.3° F.), but the next morning it had fallen to 37.7° C. The local reactionary phenomena gradually disappeared, and the only intestinal trouble observed was some slight constipation two days after the operation. Pretty much the same phenomena were noticed in the case of M. Wilbouchewitch after inoculation.

The above most interesting observations, while revealing its innocuousness, do not of course prove as yet that M. Haffkine's anticholeraic "vaccina" affords the same protection to human beings against the onslaughts of the cholera bacillus as it undoubtedly does to the animals mentioned above. The experimental proof is, for obvious reasons, not available in the case of man. It is for clinicians inhabiting cholera-infested districts to test the value of a method which, if it prove really efficacious, will confer lasting honour on the name of its discoverer.

In conclusion, I may mention that the number of persons hitherto inoculated at the Institut Pasteur by the official operator, Dr. Roux, is thirty-two.

Sept. 14th.

## Medical News.

**HOSPITAL SATURDAY FUND.**—The total amount now received on behalf of this fund for the present year reaches nearly £12,000.

We regret to announce the death of Dr. Frederick G. Jackson, at his residence, Cliff-bridge-terrace, Scarborough, at the age of seventy-one years.

**LONGEVITY IN IRELAND.**—During the June quarter, of the deaths registered in Ireland eighteen were centenarians. Nine were 100 years, one 101, three 102, one 106, two 107, and one each at 108 and 115 years respectively.

**INFECTIOUS DISEASES IN NEW YORK.**—During the two weeks ending Aug. 30th the following were the number of cases treated and the mortality of the chief zymotic affections:—Typhoid fever, 96 cases and 21 deaths; scarlet fever, 75 and 3 deaths; measles, 138 and 23 deaths; diphtheria, 111 and 31 deaths; and small-pox, 13 and 4 deaths. There were no deaths from typhus fever or whooping-cough.

**"THE GUARDIANS" AND CHLOROFORM ADMINISTRATION.**—On Saturday at a meeting of the Dartford Board of Guardians an application was made by the medical officer for the assistance of a second practitioner when administering chloroform. The chairman said there would have to be an application to the guardians and the question of advisability could then be considered. The medical officer was called into the room and explained that there was a certain amount of danger in performing an operation under chloroform, and that he would be liable to censure from the coroner if death occurred. It was the rule of the profession to have two medical men in attendance at such a case. After some discussion the board agreed to the calling in of another medical man at an operation, the fee to be charged to the board.

**CHARING-CROSS HOSPITAL.**—This institution was reopened on Sept. 12th for the reception of patients, after having been closed for nearly two months for cleaning and repairs.

A new winter sanatorium for phthisical patients was opened on Aug. 25th, at Leysin, Canton de Vaud, Switzerland. The building contains 110 rooms, none of which are less than twelve feet in height; ninety of them look south and many are in communication with broad balconies.

**ROYAL ALBERT HOSPITAL, DEVONPORT.**—The governors of this institution have decided to realise £1700 from the invested funds, for the purpose of providing a new operating theatre, a hydraulic lift and consequent structural alterations, the estimated cost of which is under £2000. These improvements have been contemplated for some time.

**BEQUESTS TO MEDICAL CHARITIES.**—The will of the late Mr. Joseph Hobson, proprietor of the Theatre Royal at Leeds, has been proved at £30,000, exclusive of realty, which will probably realise over £100,000. He has left to the Leeds Infirmary £100 a year for ten years, to the Leeds Dispensary £50 a year for ten years, and smaller amounts to other charities.

**PRESENTATIONS.**—Mr. Conrad W. Thies, secretary of the Royal Free Hospital, Gray's-inn-road, has been on his approaching marriage presented by the management committee of the institution with a handsome case of knives and forks as a mark of appreciation of his services. He has also been the recipient of various presents from the medical and nursing staff and from the officers of the hospital.—Mr. R. Nelson Jones, L.R.C.P. Lond., M.R.C.S., Swansea, has been presented by the members of the ambulance class, in connexion with the St. John Ambulance Association, with a handsome silver inkstand, in recognition of services rendered to the class.

**THE EYE INFIRMARY FOR NORTHUMBERLAND, DURHAM AND NEWCASTLE.**—The annual report for the past year states that 2777 in- and out-patients were treated during the year. Dr. Jeaffreson (honorary house governor), in his report, remarks that the pressure upon the bed accommodation had been such as to necessitate the discharge of patients in stages of convalescence scarcely consistent with safety. At present there are only twenty-two beds, and he thinks that number should be raised to fifty. The balance sheet showed a deficit of £307 12s. 3d. The annual report concludes by observing that the support received by the institution from the factories of the district is very inadequate.

**PROPOSED NEW HOSPITAL AT RUGBY.**—At the meeting of the Rugby Local Board on Saturday a communication was received from the Local Government Board with reference to the application for sanctioning the borrowing of £1100 to purchase a site for an infectious hospital, and enclosing a copy of a letter they had addressed to the Rugby Rural Sanitary Authority, in whose district the proposed site stands, and who had refused to give their sanction. The Local Government Board were convinced that the provision of a hospital was important and that the proposed site was very suitable for the purpose. They understood that the rural sanitary authority withheld their consent because certain ratepayers had urged that patients in their parish would have no right of admission to the hospital.

## Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.

- BAXTER, W. W.**, L.R.C.P., L.M. Edin., M.R.C.S., has been appointed Medical Officer for the Third and Fourth Sanitary Districts of the Tendring Union.
- CAHILL, MARK F.**, L.R.C.P., L.R.C.S. Edin., has been appointed Assistant Surgeon to the Children's Hospital, Temple-street, Dublin.
- CAUDWELL, HENRY**, L.R.C.P., L.M., L.R.C.S. Edin., has been re-appointed Medical Officer for the First Sanitary District of the Woodstock Union.
- DALBY, A. W.**, L.R.C.P., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Frome Rural and Urban Sanitary Districts, vice Parsons.
- ELLIMAN, ARTHUR C.**, L.R.C.P. Lond., M.R.C.S., has been appointed House Surgeon to the Kent and Canterbury Hospital, vice Prentice, resigned.
- GEDDIC, WM.**, M.D., C.M. Aberd., has been appointed Police Surgeon, Accrington.
- GREENHALGH, J.**, L.R.C.P., L.M. Irel., has been reappointed Medical Officer for the Cumberworth Sanitary District of the Huddersfield Union.
- GRIFFITH, AUGUSTINE**, M.B. Lond., has been appointed Second Assistant Medical Officer to the Borough Asylum, Nottingham.
- HEATON, ARTHUR F.**, M.R.C.S., L.R.C.P., has been appointed House Surgeon to the Wrexham Infirmary.
- JONES, G. E.**, L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., has been reappointed Medical Officer for the West Ardsley Sanitary District of the Wakefield Union.
- KIRTON, C. J.**, M.B. Lond., M.R.C.S., L.R.C.P., has been appointed Medical Officer for the Holywell Sanitary District of the Parish of St. Leonards, Shoreditch.
- LAMBERT, F. W.**, L.R.C.P., L.M. Edin., M.R.C.S., has been appointed Medical Officer and Public Vaccinator for the Calverley-with-Farsley Sanitary District of the North Bierley Union.

- LAWSON, D. J.**, M.D., C.M. Edin., has been appointed Medical Officer for the Portland Sanitary District of the Weymouth Union.
- LLOYD-DAVIES, HAROLD, M.B., C.M.**, has been appointed House Surgeon to the Devonshire Hospital and Buxton Bath Charity.
- MACARTHUR, D.**, L.R.C.P., L.M. Edin., L.F.P.S. Glasg., has been reappointed Medical Officer for the Lofthouse-with-Carlton Sanitary District of the Wakefield Union.
- MACGREGOR, D. A.**, M.D., C.M. Edin., has been reappointed Medical Officer for the Emley and Flockton Sanitary Districts of the Wakefield Union.
- MACKENZIE, W. S.**, L.R.C.P., L.R.C.S. Edin., has been reappointed Medical Officer for the Sharlstone, Warmfield-cum-Heath, and Newland Sanitary Districts of the Wakefield Union.
- MADDEN, THOMAS MORE**, M.R.C.P. Irel., F.R.C.S. Edin., M.R.C.S., L.F.P.S. Glasg., has been appointed Consulting Physician to the Children's Hospital, Temple-street, Dublin.
- MASON, WM.**, L.R.C.P., L.M., L.R.C.S. Edin., has been reappointed Medical Officer of Health for the St. Austell, Rural and Urban Sanitary Districts.
- OAKLEY, A. R. H.**, L.R.C.P., L.R.C.S. Edin., has been appointed Medical Officer, for the Fifth Sanitary District of the Romford Union, vice Bruerton resigned.
- READER, J.**, M.R.C.S., has been appointed Medical Officer for the Alverthorpe Sanitary District of the Wakefield Union.
- ROULSTON, WM.**, M.D., M.Ch., M.A.O. Irel., has been reappointed Medical Officer for the Crofton Sanitary District of the Wakefield Union.
- SANDERS, THOS.**, F.R.C.S. Eng., has been appointed Medical Officer for the Tenth Sanitary District and the Workhouse of the South Molton Union.
- SANDERSON, C.**, L.R.C.P., L.F.P.S. Glasg., has been reappointed Medical Officer of Health, Hastings.
- SINCLAIR, J. E.**, L.R.C.P., L.M., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Parish of the Close of St. Peter, Westminster.
- TATE, J. J.**, L.R.C.P., L.M., L.R.C.S. Irel., has been appointed Medical Officer for the Eleventh Sanitary District of the South Molton Union.
- THOMSON, ANDREW, M.B.**, C.M. Edin., has been reappointed Medical Officer for Bretton West Sanitary District of the Wakefield Union.
- THORNTON, GEO. ENT.**, M.D. Edin., M.R.C.S., L.R.C.P. Lond., has been appointed Resident Clinical Assistant to the St. Marylebone Infirmary, vice Baines, resigned.
- WALKER, H. U.**, L.R.C.P., L.R.C.S., L.M. Edin., has been reappointed Medical Officer for the Carlton Sanitary District of the Worksop Union.
- WELSH, R. A.**, M.B., B.S. Durh., has been appointed Medical Officer for the Felton Sanitary District of the Alnwick Union.
- WILKINSON, J.**, M.B., C.M. Edin., has been appointed Medical Officer for the Penkridge Sanitary District of the Cannock Union.
- WINTLE, COLSTON**, M.R.C.S., L.R.C.P. Lond., has been appointed House Surgeon to the Hospital for Sick Children and Women, Bristol.

## Vacancies.

For further information regarding each vacancy reference should be made to the advertisement.

- BETHLEM HOSPITAL.**—Two Resident Clinical Assistants.
- BRADFORD MEDICAL ASSOCIATION.**—Assistant (out-door). Salary to commence £120 per annum. (Apply to Ulna, 38, Little Horton-lane, Bradford, Yorks.)
- COUNTY ASYLUM, Prestwich, Manchester.**—Assistant Medical Officer. Salary commences at £100 per annum, with prospect of increase, together with furnished apartments, board, washing and attendance.
- COUNTY BOROUGH OF STROCKPORT.**—Medical Officer of Health for the District of the Borough, and to the Infectious Diseases Hospital, and Surgeon to the Police Force, at a salary at the rate of £400 per annum.
- DERBY PROVIDENT DISPENSARY.**—Qualified Dispenser. Salary £73, house, and allowance for cleaning. (Apply to the Secretary, 18, Hardwick, Derby.)
- GENERAL HOSPITAL, Birmingham.**—Pathologist. Salary £120 per annum.
- GENERAL HOSPITAL, Birmingham.**—House Physician. Salary £70 per annum, with residence, board and washing.
- GENERAL HOSPITAL, Birmingham.**—Surgical Casualty Officer. Salary £70 per annum.
- GENERAL INFIRMARY, Northampton.**—Assistant House Surgeon. Salary £80 per annum, with furnished apartments, board, attendance and washing.
- GREAT NORTHERN CENTRAL HOSPITAL, Holloway-road, N.**—House Physician. Salary £00 per annum, with board and lodging in the hospital.
- HOSPITAL FOR WOMEN (THE LONDON SCHOOL OF GYNÆCOLOGY), Soho-square, W.**—Clinical Assistants.
- HUDDERSFIELD INFIRMARY.**—Honorary Physician.
- KENT AND CANTERBURY HOSPITAL.**—Assistant House Surgeon. Salary £60 a year, with board and lodging.

LANCASHIRE COUNTY ASYLUM, Rainhill, near Liverpool.—Pathologist. Salary £200 per annum, with furnished apartments, board, attendance, and washing.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City-road, London, E.C.—House Physician for six months. Salary at the rate of £40 per annum, with board and lodging.

ST. PETER'S HOSPITAL FOR STONE AND URINARY DISEASES, &c., Henrietta-street, Covent-garden.—House Surgeon for six months. Honorarium 25 guineas; board, lodging, and washing.

WORCESTER COUNTY AND CITY LUNATIC ASYLUM.—Third Assistant Medical Officer. Salary £100 per annum, with board, lodging and washing.

## Births, Marriages and Deaths.

### BIRTHS.

CHAMBERLAIN.—On Sept. 10th, at Bramdean House, Southampton, the wife of Edward Twyford Chamberlain, L.R.C.P. Lond., M.R.C.S., of a son.

CLARKSON.—On Aug. 25th, at Poona, Bombay, the wife of Surgeon-Major Clarkson, of a daughter.

HENDERSON.—On Sept. 10th, at Hoshungabad, India, the wife of Surgeon-Major Cecil Henderson, of a daughter.

MORSE.—On Sept. 5th and 6th, at Upper Surrey-street, Norwich, the wife of Thomas H. Morse, F.R.C.S. Eng., of twin boys.

NICHOL.—On Sept. 8th, at 11, Ethelbert-terrace, Margate, the wife of Frank Edward Nichol, M.A., M.B., of a son.

RICE-OXLEY.—On Sept. 8th, at Streatham, the wife of A. J. Rice-Oxley, M.A., M.B., M.R.C.P. Lond., of a son.

SOUTAR.—On Sept. 11th, at Barnwood House, Gloucester, the wife of James Greig Soutar, M.B., of a daughter.

TURNBULL.—On Sept. 11th, at Ladbroke-grove, W., the wife of G. Lindsay Turnbull, M.B., of a daughter.

### MARRIAGES.

BENTHALL—SHAW.—On Sept. 6th, at Osborne, Dorset, Winfred Benthall, M.B. Cantab., of Derby, to Phæbe Mary Christians, widow of the late Matthew T. Shaw, and daughter of the late Henry Harrison, of Maple Lodge, Surbiton.

BLACKER—GOURLAY.—On Sept. 8th, at The College Church, St. Andrew's, Arthur Barry Blacker, M.D., Ebury-street, London, to Anna Isabell, third daughter of Henry Gourlay, J.P., Clatto House, Fifeshire.

CAMPBELL—PAULL.—On Sept. 10th, at the Ascension Church, Ballin-hill, Richard Campbell, M.D., of Dalston, to Isabel Edith, eldest daughter of Alfred Paull, of Clapham-park.

CRESWELL—TOWGOOD.—On Sept. 12th, at Holt, Norfolk, John Edwards Creswell, M.B., seventh son of the late Edmund Creswell, Esq., of Gibraltar, to Catherine Burleigh, second daughter of the late Matthew Towgood, of Ceylon.

LANE—PINCHIN.—On Sept. 12th, at St. Andrew's, Stoke Newington, Frank Lane, L.R.C.P. Lond., M.R.C.S., L.S.A., to Florence Mary (Polly), youngest daughter of the late William Pinchin, of Snaresbrook, Essex.

TAYLOR—BISHOP.—On Sept. 7th, at Christ Church, Lancaster-gate, W., Seymour Taylor, M.D., M.R.C.P., of Seymour-street, Portman-square, to Edith, eldest daughter of Edgar Bishop, of Lancaster-gate and Highwood, Middlesex.

THORPE—SHUTTLEWORTH.—At Dallington Church, on Sept. 7th, by the Rev. P. Ward, Curate of St. Mary's, East Moulsey, assisted by the Rev. T. C. Beasley, M.A., Vicar of the Parish, Arnold Edward Thorpe, L.R.C.P., &c. (Edin.), of Newport, Salop, to Edith, second daughter of Joseph Shuttleworth, of Elmleigh, Dallington, Northamptonshire.

WARD—MORGAN.—On Sept. 8th at St. James's Church, Swansea, Manley Edward Ward, L.R.C.P., M.R.C.S., of Brasted, Kent, to Katharine Sophia Morgan, youngest daughter of the late Rev. Lewis Morgan, Vicar of Llangedock, Carmarthenshire.

### DEATHS.

CLARKE.—On Sunday, Aug. 23th, 1892 (suddenly), Thomas Edward Clarke, M.R.C.S. Eng. & L.S.A., aged 46 years.

FURSE.—On Sept. 12th, at Morton-crescent, Exmouth, Edwin Furse, J.P., Surgeon, South Molton, Devon, aged 53.

JACKSON.—On Sept. 6th, at Scarborough, Frederick Gorvis Jackson, M.D., aged 71.

ROGERS.—On Sept. 2nd, at Cannon-place, Brighton, R. J. Rogers, M.R.C.S.

SALZMANN.—Recently, at his residence, Montpellier-road, Brighton, F. W. Salzmann, M.R.C.S.

STEVENSON.—On Sept. 8rd, at San Jacinto, California, Geo. Stevenson, M.A., M.R.C.S., second son of James Stevenson, M.D., Medical Officer of Health for Paddington, aged 35.

*N.B.*—A fee of 5s. is charged for the Insertion of Notices of Births, Marriages, and Deaths.

## Notes, Short Comments & Answers to Correspondents.

*It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.*

*All communications relating to the editorial business of the journal must be addressed "To the Editors."*

*Lectures, original articles, and reports should be written on one side only of the paper.*

*Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.*

*We cannot prescribe or recommend practitioners.*

*Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."*

*Letters relating to the publication, sale, and advertising departments of THE LANCET to be addressed "To the Publisher."*

*We cannot undertake to return MSS. not used.*

### BLISTERING BY LIVING CANTHARIDES.

*Mr. Richmond Leigh (Liverpool) writes:—*

"A correspondent on the West Coast of Africa recently wrote me that the residents were suffering from a plague of the cantharides fly, as he termed it. These insects were so numerous and troublesome that he was unable to rest in bed, and had to pass the night in his sitting-room, being blistered all over at the time of writing. Some of his neighbours were in a terrible state, evidently much worse than himself. Fortunately no serious trouble resulted; for though the blisters were very painful, they disappeared spontaneously in a few days. This is a new terror added to a residence in the tropics, though it must be an uncommon one, as my correspondent has not mentioned it before, though he has lived in the neighbourhood three or four years. It is interesting to know that the bite of the living insect has a similar effect to that of the preparations of the dead. The active principle is evidently in the juices as well as the solids of the body. I do not remember to have seen any reference to this action of cantharides, and send it you trusting it may be of interest to your readers."

*Querulus.*—1. Many men do so practise with only surgical qualifications. Their certificates are accepted as from "registered" practitioners. We are not aware of their being prosecuted under the Apothecaries Act.—2. A pure physician should not have "Surgeon" on his door unless his licence, as in the case of the London College of Physicians, purports to be both a medical and surgical qualification.

*Mr. H. Bruce Jones (Reading).*—We do not recommend practitioners. Our correspondent should consult his usual medical attendant.

*S. W. Dublew* does not enclose his card.

### A RARELY OBSERVED CASE OF FACIAL ERYSIPELAS—TO WIT, A FLY.

*To the Editors of THE LANCET.*

SIRS.—I was called a few days ago to a case of well marked facial erysipelas, the parts primarily affected being the left malar region and the external ear. The patient was unaware of having had any injury to the part, and it seemed, therefore, that the attack might be assumed to be "idiopathic." Being sceptical as to the possibility of any disease arising "idiopathically," I inquired particularly if she had had any running from the ear, and learnt that there had been a slight watery discharge for a few hours before the attack commenced, which was two days before I saw her. The parts were too much inflamed to allow of any examination of the meatus with the speculum; but on the strength of the history of a precedent discharge I ordered the external auditory meatus to be irrigated with a hot solution of perchloride of mercury, 1 in 3000. This gave great relief, and on a subsequent day the patient told me that she was in the habit of picking dry wax out of her ears with the head of a pin. Whenever she did this the operation was followed by a thin watery discharge for a few hours. She had thus treated both ears on the day before the present attack began, and on the following morning had been woken up by a fly getting into her left ear, and she had had some difficulty in extracting it. During the course of the day the premonitory symptoms of the attack set in. Two or three days later, when the symptoms were abating on the left side, a similar but less acute attack developed on the right side, commencing at the auditory meatus. There seems little room to doubt that the fly carried the poison, which produced the attack, to a slight abrasion inside the left external meatus, and probably the patient's fingers carried some desquamating particles to a similar slight abrasion on the other side. I have ventured to submit this case to the notice of your readers because this sequence of cause and effect may probably be a typical one, though one that would easily escape observation.

I am, Sirs, yours faithfully,

Hanley, Staffs, Sept. 1st, 1892. ARTHUR E. NEVINS, F.R.C.S. Edin.

## MEDICAL EDUCATION IN SWITZERLAND.

THE final or professional examination is divided into two parts—(1) Examen Pratique; (2) Examen Oral. Both must be passed at the same time, but a candidate may be rejected on one or the other—there is no balancing of marks, or making up deficiency in one subject for weakness in another. The students are aware of what is required and work very hard in consequence. Although they are as a rule extremely well up, and rarely under five or six years' standing, it has happened that 25 or 50 per cent. have been rejected at an examination (2 out of 4 on one occasion last year). The dates and subjects of the last examination are appended. The language required is the French. The following is an account of the medical examination for the Federal Diploma, held at Geneva:—*Examen Pratique*.—April 27th, Medicine (written), four hours; 29th, Hygiene (written), four hours; 29th, Surgery (written), four hours; May 1st, Pathological Anatomy and Microscopic Specimens; 2nd, Gynecology and Manœuvres on the Mannequin; Medicine, with cases; 7th, Surgery, with cases; Operations on the Dead Body; 12th, Medical Jurisprudence (written), four hours; 13th, Ophthalmology. *Examen Oral*.—May 25th, Pathology, Physiology; 26th, Surgery, Diseases of Women and Accouchements; 27th, Medicine, Hygiene, Therapeutics.

*Mr. Bradford*.—Our correspondent should repeat the narration of the facts to the Registrar-General for Scotland. In England such a case would be investigated by the coroner of the district. Falling any satisfactory reply from the Registrar-General, the facts should be reported to the General Medical Council.

*R. B. K.*—Our correspondent may rely on the accuracy of the information; but in his own interest he should take the trouble to verify it for himself.

## "THE DEATH CERTIFICATE."

To the Editors of THE LANCET.

SIRS,—With regard to the giving of death certificates, I beg to say I lately went to act as locum tenens for a friend who was getting married. Just before the ceremony he called in to see an old lady who was dying, and within two hours started on his honeymoon trip with an uncertain destination. In the meantime the old lady had died, and her friends came the same day for the certificate, which they were anxious to have at once, as the registrar lived in another village some miles off, whilst they were at the same time four miles from the surgery. Being rather puzzled what to do under the circumstances, as it was so uncertain when I should hear from my friend to say where he was, not to mention the delay that would probably ensue before I could write to him, I at length made out a certificate, crossing out the letter "A" in each place and inserting my friend's name instead, giving the cause of death, signing my own name, and adding a postscript stating the circumstances of the case, and this the registrar duly accepted. I did not go to see the body, however; but it has struck me that this should never be neglected, as it is quite possible, though improbable, that great frauds might be perpetrated upon insurance companies otherwise. For suppose a patient seems to be desperately ill, that the medical attendant prematurely gives up all hope, and that before his next visit he receives an application for the certificate from the friends, whereas in reality the patient has rallied and ultimately recovers, it would be a disagreeable business for the medical attendant if he incautiously granted the certificate without having been to view the body. If the fraud were found out the parties concerned in it, being evidently not over-scrupulous, might probably try to drag him into it and even represent him as the prime instigator of it. It seems to me therefore that the law should make it compulsory for the medical practitioner to certify not only the cause but also the fact of death; for there is another form of fraud that might be perpetrated—viz., a child or idiot cheated out of an inheritance. I myself have not made it a rule to view the body, but I shall in future always do so.

I am, Sirs, yours obediently,

C. L.

Sept. 12th, 1892.

To the Editors of THE LANCET.

SIRS,—Some time ago I was called in on an emergency to see the patient of one of the oldest practitioners in the West-end. It was a case of apoplexy; the patient died in a few hours. I sent for her medical attendant, who had not seen her for several months, and suggested that he was the one to give the certificate, to which he agreed. I produced the printed form; but, to my astonishment, he said he never used one, and that his certificates had never been refused by the registrars. He wrote on a sheet of note-paper and worded it as he thought proper. I suppose the present Act does not compel us to use the form supplied by the registrar.—I am, Sirs, yours obediently,

Sept. 9th, 1892.

## "FUCUS VESICULOSUS."

To the Editors of THE LANCET.

SIRS,—Referring to the note of "Enqurens" on fucus vesiculosus in THE LANCET of the 20th ult. I may state that we have lately treated a patient by a course of that drug. While the patient was taking the liquid extract in drachm doses there was a slight diminution in weight in the first week, but in the succeeding fortnight his weight rose 1lb—viz., from 16st. 11lb. to 16st. 12lb. The drug was then discontinued.

The weight in the succeeding fortnight rose half a pound, and by the next week again fell to 16st. 12lb. Then another course was tried in combination with liquor potassæ, and after a fortnight the weight was reduced to 16st. 10½lb., there it remained steady and the drug was again discontinued. The symptoms of which the patient complained were thirst and unwellness, and it would appear that the drug relieved the thirst while it failed materially to reduce the obesity.

I am, Sirs, yours faithfully,

A. R. URQUHART, M.D.

James Murray's Royal Asylum, Perth, Sept. 14th, 1892.

## "THE MIDDLESEX HOSPITAL."

To the Editors of THE LANCET.

SIRS.—Will you kindly permit me to make a correction and also an addition to an item under the above heading in the Medical News in your last issue?

The name of the lady under whose will £1000—the executor exercising a wise discretion—have been awarded to the Middlesex Hospital is *Holm*, not "*Holms*." She was the widow of the late Henry Haley Holm, M.R.C.S., from whose estate the benefaction in question, in common with the many others just distributed, was exclusively derived. Henry Haley Holm, although circumstances caused his early retirement from the profession, was not altogether unknown in his time, and I think his name may be found in the earlier numbers of your journal. He adopted with considerable enthusiasm the phrenological theories of the late Dr. Spurzheim, of whom he was the intimate and valued friend, in common with his father, the late J. D. Holm of Highgate. The latter devoted three of his sons—namely, Henry Haley Holm, Joseph White Holm (both deceased) and myself—to the profession, and we alone of that name have been on its roll in this country. I trust I may therefore be pardoned for wishing that the source whence these benefactions are being made may not be overlooked. I think H. H. Holm was, with my father, one of the many original founders of the London University, now University College.—I am, Sirs, yours truly,

JOHN HOLM.

*Correspondent*.—Such limited qualifications are now neither recognised nor registrable. As to the offence of "covering" by a practitioner whose assistant holds the L.M., it would depend on circumstances. If he lived at a distance and had independent charge of cases the offence would be committed—not otherwise.

*Mr. L. G. Guthrie*.—Our correspondent puts the awkwardness—not to say absurdity—of such decisions as to the mode of notification effectively. But we cannot find room for his communication. We must restrict ourselves for the present to comments on particular cases.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Althaus, London; Mrs. Adcock, Hendon; Dr. Allan, Glasgow; Mr. Anderson, Dublin; Mr. Atkinson, London; Mr. Bennett, London; Dr. Irwin Bolton, Constanta, Roumania; Messrs. NOTICE.—Advertisers are requested to observe that it is contrary to the Postal Regulations to receive at Post Offices letters addressed to initials only.

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only a ready means of finding any notice, but is in itself an additional advertisement. Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance. Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET. Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed. THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 66, Rue Caumartin, Paris.

# KEPLER EXTRACT OF MALT.

Prepared only from Pure Malted Barley of the Best Selected Quality.

## PROPERTIES.

## NON-ALCOHOLIC.

## NUTRITIOUS.

## AS GOOD AS OIL.

## DIGESTIVE.

## EMOLLIENT.

## IN NURSING.

## IN CONSUMPTION.

## NO OTHER NAME.

## SAMPLES FREE.

It is light in colour, agreeable in flavour, and especially rich in the valuable properties of Malt—viz., Diastase, Dextrine, Malt Sugar, Albuminoids Phosphates, &c.

The Kepler Extract of Malt is not a fermented product. The nutritive properties are not sacrificed to the formation of alcohol, nor the digestive properties destroyed by heat. It is prepared *in vacuo* at a very low temperature.

The Kepler Extract of Malt is highly nutritious for every part of the organisation. It supplies an assimilable form of sugar which is not liable to acetous fermentation, as is the case with cane sugar. Its phosphates having passed through the vitalising process of plant life are more readily assimilated than phosphates chemically prepared, and its albuminoids and dextrine are ready for immediate assimilation. As a bone-former it is, perhaps, unequalled, and is largely prescribed by surgeons in cases of rickets, deficient bony structure, &c.

The Kepler Extract of Malt is prescribed by many physicians in place of Cod Liver Oil, and eminent medical authorities pronounce Extract of Malt to be preferable to Cod Liver Oil. As, however, the administration of fat is desirable in many cases, the Kepler Solution of Cod Liver Oil constitutes an ideal fat, which is perfectly suitable for nourishing every part of the human frame.

The Kepler Extract of Malt is a powerful digestive agent owing to the perfect preservation of its diastase in an active form, and repeated analysis has proved the Kepler Extract of Malt to be superior to ordinary articles in this respect.

The Kepler Extract of Malt possesses remarkable emollient properties. It also acts as a natural regulator of the bowels, and is useful in small doses in diarrhoea and catarrh of the bowels, it being readily assimilated when other foods are rejected. In large doses it is an efficient aperient in constipation.

As a food in fevers and in cases of mal-assimilation the Kepler Extract of Malt is probably unequalled. It may be given alone or mixed with soda water, and it forms a very agreeable beverage when mixed with half milk and half soda water. When mixed with milk it possesses the remarkable property of preventing the heavy clot which forms upon the addition of acid, and undoubtedly one of the best foods for infants and invalids is made by adding a tablespoonful of the Extract to half-pint of milk, with a pinch of bi-carbonate of soda, which neutralises the slight acidity usually present in milk.

"The introduction of the Kepler Extract of Malt," says THE LANCET, "constitutes as important an advance in therapeutics as was the introduction of Cod Liver Oil." This statement is borne out by the fact that the Kepler Extract of Malt is now used in all the principal hospitals in Great Britain and the Colonies, and as the LONDON MEDICAL RECORD states, "is the Extract which every physician now prescribes."

The Kepler Extract of Malt is known by no other name, and should be prescribed as "Kepler Extract of Malt," or "Extractum Malti-Kepler," when the physicians will secure a superior product at a reasonable price.

Supplied to the Medical Profession in  $\frac{3}{4}$ -lb. and  $1\frac{1}{2}$ -lb. bottles, at 1s. 8d. and 3s. each Retail, 2s. 6d. and 4s. each.

BURROUGHS, WELLCOME, & CO., SNOW HILL BUILDINGS, LONDON, E.C.

# HOOPER'S ELASTIC WATER OR AIR BEDS AND CUSHIONS.

TELEPHONE NUMBER—3857.

## An Analysis

OF

FIFTY CASES OF VALVULAR DISEASE OF THE HEART, WITH REMARKS.<sup>1</sup>By JAMES ALEXANDER LINDSAY, M.A.,  
M.D., M.R.C.P. LOND.,PHYSICIAN TO THE BELFAST ROYAL HOSPITAL; CONSULTING PHYSICIAN  
TO THE ULSTER HOSPITAL, BELFAST.

As a basis for the discussion which is to follow I shall begin by giving a short analysis of fifty cases of valvular disease of the heart occurring in my practice within the last few years. The cases have not been in any way specially selected and may be taken as fairly typical examples of the disease in question. I should perhaps remark that the series consists almost exclusively of adult cases.
